In 2005, new legislation amends the SGP deepening MTO and EDP (Council Regulations 1055/2005 and 1056/2005). This regulation favors the consideration of national circumstances and adds more economic rationale to the rules to be complied with. According to this regulation, each member state shall have a differentiated medium-term objective for its budgetary position. These country-specific MTO may diverge from the requirement of a close to balance or in surplus position. They shall provide a safety margin with respect to the 3% of GDP government deficit ratio; they shall ensure rapid progress toward sustainability, and, taking this into account, they shall allow room for budgetary maneuver, considering in particular the needs for public investment. Taking these factors into account, the country-specific medium-term budgetary objectives shall be specified within a defined range between –1% of GDP and balance or surplus, in cyclically adjusted terms, net of one-off and temporary measures. Furthermore, the EC and the Council, when assessing and deciding upon the existence of an excessive deficit, may consider an excess over the reference value resulting from a severe economic downturn as exceptional if the excess over the reference value results from a negative annual GDP volume growth rate or from an accumulated loss of output during a protracted period of very low annual GDP volume growth relative to its potential. The EC shall take into account and reflect developments in the medium-term economic position (in particular the potential growth, prevailing cyclical conditions, and implementation of policies in the context of the Lisbon agenda and policies to foster research and development and innovation) and developments in the medium-term budgetary position (in particular, the fiscal consolidation efforts in "good times," debt sustainability, public investment, and overall quality of public finances). Furthermore, the EC shall give due consideration to any other factors which, in the opinion of the member state concerned, are relevant in order to

comprehensively assess in qualitative terms the excess over the reference value and which the member state has put forward to the EC and to the Council. In that context, special consideration shall be given to budgetary efforts toward increasing or maintaining at a high-level financial contribution to fostering international solidarity and to achieving European policy goals, notably the unification of Europe if it has a detrimental effect on the growth and fiscal burden of a member state.

In December 2011, it entered into force a new set of rules for economic and fiscal surveillance that reinforces both the preventive and the corrective arms of the SGP (European Union 2011). These new measures, the so-called Six-pack (6P), are made of five regulations (Regulation 1173/2011, Regulation 1174/2011, Regulation 1175/2011 amending Regulation 1466/97, Regulation 1176/2011, Regulation 1177/2011 amending Regulation 1467/97) and one directive (Directive 2011/85/EU) proposed by the EC and approved by member states. The 6P strengthened the existing legislative framework, specifically the instruments available for the EU's economic policy coordination and multilateral surveillance. The Regulations 1174/2011 and 1176/2011 focus on macroeconomic imbalances, and the other regulations center on fiscal policy.

Specifically, Regulation 1174/2011 presents the measures to correct excessive macroeconomic imbalances in the euro area. This regulation lays down a system of sanctions for the effective correction of excessive macroeconomic imbalances in the euro area. Regulation 1176/2011 sets out detailed rules for the detection of macroeconomic imbalances, as well as the prevention and correction of excessive macroeconomic imbalances within the EU too. According to this regulation, the EC prepares and publishes an annual report containing a qualitative economic and financial assessment based on a scoreboard with a set of indicators the values of which are compared to their indicative thresholds.

On the other hand, Regulation 1173/2011 focuses on the effective enforcement of budgetary surveillance in the euro area. It sets out a system of sanctions for enhancing the enforcement of the preventive and corrective parts of the SGP in the euro area. In this sense, Regulation 1175/2011 sets out the rules covering the content, the submission, the examination, and the monitoring of stability programs and convergence programs as part of multilateral surveillance by the Council and the EC so as to prevent, at an early stage, the occurrence of excessive general government deficits and to promote the surveillance and coordination of economic policies thereby supporting the achievement of the EU's objectives for growth and employment.

According to the later regulation, a deviation from the MTO or from the appropriate adjustment path toward it shall be evaluated on the basis of an overall assessment with the structural balance as the reference, including an analysis of expenditure net of discretionary revenue measures. The assessment of whether the deviation is significant shall, in particular, include the following criteria:

(a) For a member state that has not reached the MTO, when assessing the change in the structural balance, whether the deviation is at least 0.5% of GDP in a single year or at least 0.25% of GDP on average per year in two consecutive years
(b) When assessing expenditure developments net of discretionary revenue measures, whether the deviation has a total impact on the government balance of at least 0.5% of GDP in a single year or cumulatively in two consecutive years

The deviation of expenditure developments shall not be considered significant if the member state concerned has overachieved the MTO, taking into account that the possibility of significant revenue windfalls and the budgetary plans laid out in the stability program do not jeopardize that objective over the program period. Similarly, the deviation may be left out of consideration when it results from an unusual event outside the control of the member state concerned and which has a major impact on the financial position of the general government or in case of severe economic downturn for the euro area or the European

Union as a whole, provided that this does not endanger fiscal sustainability in the medium term.

Regulation 1177/2011 lays down the provisions for speeding up and clarifying the EDP. This rule highlights the importance of government debt criteria (debt ratio above 60% of GDP) together with the government deficit one. Furthermore, it clarifies that the ratio of the government debt to GDP is considered sufficiently diminishing and approaching the reference value at a satisfactory pace if the differential with respect to the reference value has decreased over the previous 3 years at an average rate of one twentieth per year as a benchmark, based on changes over the last 3 years for which the data is available. The requirement under the debt criterion also is considered to be fulfilled if the budgetary forecasts of the EC indicate that the required reduction in the differential will occur over the 3-year period encompassing the 2 years following the final year for which the data is available.

Finally, Directive 2011/85/EU presents detailed rules concerning the characteristics of the budgetary frameworks of the member states. These rules are necessary to avoid excessive government deficits.

In March 2012, the Treaty on Stability, Coordination, and Governance in the Economic and Monetary Union (TSCG) was signed by the leaders of 25 EU member states at that time (all but the United Kingdom and Czech Republic). It entered into force on 1 January 2013. It also aims to strengthen fiscal discipline in the euro area through a balanced budget rule and an automatic correction mechanism, to strengthen the coordination of their economic policies, and to improve the governance of the euro area, thereby supporting the achievement of the EU's objectives for sustainable growth, employment, competitiveness, and social cohesion. Despite there are already detailed EU about these issues, particularly about fiscal stability, TSCG repeats some of these rules, reinforces some, and introduces some new rules. The treaty is an intergovernmental treaty and not an EU treaty, but its implementation involves using the EU institutions. It binds only EMU member states, while other contracting parties will be bound once they adopt the euro or earlier if they wish. The fiscal part of TSCG is frequently referred to as "Fiscal Compact Treaty" or "Fiscal Stability Treaty." This part requires contracting parties to respect/ensure convergence toward the MTO, with a lower limit of a structural deficit of 0.5% of GDP or 1% of GDP for member states with a debt ratio significantly below 60% of GDP. In the event of significant observed deviations from the MTO or the adjustment path toward it, a correction mechanism is triggered automatically. The mechanism includes the obligation of the country concerned to implement measures to correct the deviations over a defined period of time. The European Court of Justice may impose financial sanction (that shall not exceed 0.1% of GDP) if a country does not properly implement the new budget rules in national law and fails to comply with a European Court of Justice ruling that requires it to do so. The amounts imposed on a country whose currency is the euro shall be payable to the European Stability Mechanism. In other cases, payments shall be made to the general budget of the EU.

The sovereign debt crisis suffered by some euro area of member states shows the risks and the potential economic, financial, and budgetary consequences on the eurozone. Based on this rationale and building on the 6P, the European Parliament and the Council adopted two further pieces of legislation aimed at strengthening the surveillance mechanisms in the euro area which entered into force at the end of May 2013. This so-called Two-pack (2P) consists of two regulations: Regulation 473/2013 of the European Parliament and of the Council on common provisions for monitoring and assessing draft budgetary plans and ensuring the correction of excessive deficit of the member states in the euro area and Regulation 472/2013 of the European Parliament and of the Council on the strengthening of economic and budgetary surveillance of member states in the euro area experiencing or threatened with serious difficulties with respect to their financial stability. These two new regulations contribute to strengthening the surveillance mechanisms applicable to all member states in the euro area, while at the same time they establish a comprehensive and better aligned surveillance regime for those member states in the euro area threatened

with or experiencing serious difficulties with respect to their financial stability, those in receipt of financial assistance, and those that are in the process of exiting such assistance.

At the end of 2014, the EC presented a review of the Regulations in the 6P and 2P (European Commission 2014). This review has revealed some strengths, as well as possible areas for improvement, concerning transparency and complexity of policy making, and their impact on growth, imbalances, and convergence. Although the EC expresses its general satisfaction with the way the regulations helped the EU weather the economic crisis, it notes that, at this stage, the review cannot be comprehensive because of the short experience of their operation. Furthermore, the EC points out that the effectiveness of the regulations needs to be further tested, as until now they have been applied only under severe financial and economic crisis, whereas the preventive arm of the packs also needs to be tested under better conditions. Therefore, the EC considers that this review serves as an initial basis for examination which has to be discussed with the European Parliament.

## Conclusions

The Stability and Growth Pact for the European Union, which sets the well-known limits for budget deficits and public debt of 3% and 60% of GDP, was introduced at the same time as the single currency in order to ensure sound public finances across the EU. However, the way it was enforced before the crisis did not prevent the emergence of serious fiscal imbalances in some member states. These imbalances were exposed during the financial crisis.

As a response to weaknesses in its economic governance system revealed by the economic and financial crisis, the EU has taken a wide range of measures to strengthen economic governance and to achieve sustained convergence, economic growth, and jobs. Central to these efforts have been the legislative packages known as the "Six-pack" and "Two-pack." The legislation aims at a closer coordination of economic policies through a strengthening of budgetary surveillance under the Stability and Growth Pact, the introduction of a new procedure in the area of macroeconomic imbalances, the establishment of a framework for dealing with countries experiencing difficulties with financial stability, and the codification in legislation of integrated economic and budgetary surveillance.

According to the European Commission, the new legislation had contributed to the progress of fiscal consolidation in the EU. The review highlighted some strengths as well as possible areas for improvement, which has to be discussed with the European Parliament and member states.

## Synonyms

Financial management; Public budgeting

## Definition

The process by which a government collects, distributes, and manages financial resources in a society.

## Introduction

*Public* budgeting refers to financial decisions for governments (municipalities, counties, states, countries, etc.) and public organizations. Public budgets are unique in that they support the functions of government – intervening in market failures (for example, supplying public goods), economic stabilization, and redistribution (For full discussion on market failures see Weimer and Vining (2011), Chapter 5. For discussion on functions of government see Mikesell (2014), Chapter 1). Politics enters public budgeting decisions in several different ways – process, taxation and revenue systems, expenditure choices, balancing the budget, and so forth (Rubin 2014). While many people view budgets as simply numbers on a page, those who have studied the budgeting process know it represents more than just dollar amounts, but the dynamics of power struggles among branches of government, elected officials, citizens, political parties, interest groups, and bureaucrats among other actors (Wildavsky and Caiden 2004). Public budgets set the course of government activities and dictate what governments will and will not provide for its citizens. In a deeper sense, all of the financial allocations give estimates of the government's priorities. As binding documents, public budgets can also be a source of accountability. This entry will provide an overview of the political characteristics of the public budgeting process in the context of the United States federal and state governments.

## What Makes *Public* Budgeting Unique?

The budgeting process is conducted for private/individual use and for businesses, in addition to public organizations and governments. Each type

of budgeting has unique features. Public budgeting differs from the other two categories (individuals and businesses) in four key ways (Mikesell 2014). One, government resources can be expanded through taxation. Although raising the tax rate or creating new taxes is never favorable to citizens or easily accomplished by public officials, it is a unique feature of public revenue generation. Theoretically, governments can extract more financial resources without providing improved goods or services. For businesses to gain greater financial resources, they must do things such as ramp up production, find new clientele, or increase prices (which leads to lower demand). For individuals, they must generally work more or find a higher paying job.

Two, there are many stakeholders (elected officials, citizens, bureaucrats, nongovernmental organizations, interest groups, political parties, etc.) who are concerned with government decisions and outcomes – this leads to a blurred view of who truly "owns" the government. Without a clear owner, it becomes difficult to meet and prioritize all of the diverse views and demands in society. In business and private budgeting, the "owners" and decision-makers are known by members, employees, and customers. Furthermore, there are typically one or only a few key actors – fewer actors than the government must accommodate. Public budgeting is further complicated since budgets are constructed to last a full year or two and are often constrained (by funding structure, controls to limit financial abuse, implementation of oversight, see Rubin (2014), Chapter 1) in how quickly it can adjust to current demands.

The third difference between public and other types of budgeting processes is the difficulty in quantifying or measuring government services. Many goods and services provided by government are normative or broadly defined public goods (nonexclusive and nonrivalrous). For example, how should government measure the success of public education, environmental protection, the judicial system, or health initiatives? There is no one correct answer. Measuring success in businesses is typically done through sales figures or total profits – items that are more easily quantified or widely agreed upon as legitimate measures of success.

Lastly, governments are involved with "public trust and reputations of all citizenry" (Mikesell 2014, p. 2). Because of this, not all the financial tools available to businesses and individuals, like bankruptcy or default, can be considered by governments. Governments must work to preserve their citizens' confidence in the financial system and a functioning economy. Recovery from economic downturns can take years. Businesses, on the other hand, can attract many different types of clients and customers. Relatedly, government officials are entrusted to spend the citizens' money – this means government must be responsive and accountable to their constituents' requests or get voted out of office. Businesses and individuals spend their own money, which gives them somewhat more flexibility in budgeting decisions.

## What Are the Components of Public Budgets?

In simplest of terms, budgeting is the process of deciding how to collect and allocate scarce financial resources. In more in-depth terms, a budget is "a financial plan that carries forward the financial implications of carrying out a particular planned response to the anticipated operating conditions in a future period (typically a year)" (Mikesell 2014). In this view, there are three distinct parts to a complete budget: a financial plan that reflects expenditures and sets the size of public sector, a revenue forecast as to how government will get money, and a management plan to handle differences between expenditures and forecasts (Mikesell 2014). Politics influences each of these three categories, as will be explained in the subsections below.

### Politics of Expenditures

Choices must be made on potential expenditures. However, making these choices on how to allocate financial resources can be a highly contentious and political process – meeting all the needs in a diverse and changing society is impossible. In an effort to get more input on budgeting choices,

the government has set up extensive and lengthy procedures for elected officials and bureaucrats to justify their budgets. While good intentions and responsiveness to current political sentiment helped to create these procedures, in reality it has now become a process filled with inefficiencies. Today, the dominant actors in the expenditure process are agency heads, legislatures, the president, and interest groups. The major government agencies in charge of budget development are the Office of Management and Budget (OMB) and Congressional Budget Office (CBO). The OMB serves the president and works to implement his political agenda. The CBO assists congressmen and their staff.

Agencies and elected officials are always looking to secure more funds through the budgetary process for their causes. There are several strategies that can help aid this endeavor (Rubin 2014). For agency heads, they should work to form relationships with the legislatures that will vote on their budget proposals. By gaining their favor, agencies may be able to gain access to more funds through earmarks, budget proposals, or in implementation. Another successful strategy is building a geographic coalition and then expanding. Having a large concentration of citizens who depend on agency/public organizations' work will lead to more congressional support. Expanding will bring in more constituencies to potentially create a block of congressional support. One of the most important strategies agencies can do is demonstrate the unlimited value of their work and how it is done efficiently and effectively for a low price. With the growth of performance budgeting, politicians need to know what outcome they are getting for the price. Producing essential goods and services for Americans at a low price is a sure way to gain favor in budgetary decision-making.

Expenditures are classified as discretionary or mandatory. Discretionary expenditures can be changed and controlled by officials through the budgeting process, while mandatory expenditures are government obligations that must be paid to citizens. In the United States federal budget, a vast majority of expenditures are mandatory entitlements (for example, Social security and Medicare). Only about 20–30% of the annual budget is discretionary. This smaller portion of the budget is where many of the hard-fought political battles take place. In addition, this part of the budget must be responsive to the current demands of the day and be able to respond to any potential issues (seen or unforeseen) in the future.

### Politics of Revenue

In the American context, revenue collection is one of the most polarizing issues. Citizens, politicians, and the media consistently debate about the tax system. The tax code is arguably one of the most complicated processes created by our government. Even the tax experts have difficulty keeping up with the massive number of changes in tax laws from year to year. Amid all this complexity, though, all taxes face fundamental questions that elected officials and citizens must consider.

To collect public funds, decisions must be made about *how* public money will be collected, *who* will pay, and *how much* money needs to be obtained to carry out planned activities. Elected officials and interest groups are the major actors in deciding revenue systems. Depending on the desired level of expenditures (again, this comes back to the government's policy goals), decisions must be made on if existing taxes should have increased or decreased rates, which type of tax or user fee will generate funds, and the availability of tax credits or exemptions.

Citizens, of course, overwhelmingly believe taxes should be decreased or at the very least should never see an increase. Elected officials will find it hard to win a campaign on the idea that taxes should be raised (an exception would be those that say taxes should be raised on the rich in society). The platform adopted by most candidates is that taxes should decrease and the government should use funds more efficiently. To ensure citizens will not see a massive tax increase, many state and local governments have set legal limits on the amount of tax rate increases per year or require supermajorities in the legislature to pass tax increases. Given all of the negative attitudes around taxes, especially the potential at tax increases, it seems unlikely that increases occur. However, there are times that elected officials are able to raise the tax rate. To accomplish this, there are strategies officials can adopt such as: detailing

the legitimate revenue problem and the consequences of not receiving adequate funding, explaining exactly what the new revenue will be used for, balancing the increased tax burden on all (many) groups in society so no one group is having to sacrifice a lot, trying for a temporary tax increase, or having a public referendum to gain official public support (for more explanation see Rubin (2014), Chapter 2).

There are many types of taxes and fees at public officials' disposal, all with pros and cons. Overall, the tax system must rely on a variety of revenue types so all of the worst features of one tax are not exaggerated, leading to one group that is overly burdened to pay for public goods and services. For any tax, defining taxable wealth is a difficult decision – both technically and politically. A good tax system diversifies how funds are generated by pulling from different pockets of wealth in society. Politics, unsurprisingly, guides the choice of and details of taxes. For example, the income tax system for the US federal government is under scrutiny for its filing complexity, equity (see Mikesell (2014), Chapter for discussion on tax equity) concerns between high- and low-income individuals, plethora of exemptions (which erodes the taxing base and adds complexity), and its dominance in federal government revenue generation. Property taxes are also constantly questioned for their assessment accuracy and horizontal equity issues. Sales taxes are collected in small amounts as purchasing transactions occur, thus, individuals do not usually complain about these. There are exemptions to sales tax, like labor and food. However, of the goods that are taxed, most people do not realize how this tax can add up over time to result in a sizable contribution to the government.

Credits/exemptions are part of majority of taxing systems and have grown over time. One positive aspect about tax breaks is their ability to offset inequitable features of taxes (for example, sales tax exemptions for food or income tax deductions for major medical expenditures). Furthermore, tax breaks can be used to target specific industries and sectors of work that are promising to enhance the economy. Elected officials fight for tax breaks in order to please more constituents (and gain votes). However, while everyone enjoys paying less taxes, used in excess, credits and exemptions can erode the tax base, leading to a higher rate for all other payers.

### Politics of Balancing the Budget

In connection to expenditures, the revenue collection needed by a government is dependent upon the amount of anticipated expenditures. The money coming in to government must be equal to or greater than the money being spent by government. If these two categories come out of balance (typically a deficit of more money being spent than collected), a plan must be made to get them back in balance. There are only a few ways to do this – either raise more revenue, cut spending, or some combination of the two options. Each of these options has political and partisan motivations. Raise rates on which tax? Which group of people will pay the higher tax? Which programs will have their funds cut? How much? Raising taxes and cutting programs are both politically unfavorable things for elected officials to do – thus, they avoid doing so, leading to increasing debt and last minute budget deals.

The urgency of clearing the debt depends on the government's rules (like the debt must be cleared by the end of the budget cycle or it may accumulate from year to year) or environmental conditions (war, economic recession, etc.). There are ideological divisions on the tolerance of debt. Political liberals tend to favor debt as a mechanism of remediation in economic recessions. Welfare and unemployment spending are one way officials try to spark straggling economic activity. Political conservatives argue spending must be curtailed when revenue drops due to economic recession. However, deficit can be acceptable if the tax breaks go towards businesses and wealthy who can create jobs to stimulate the economy.

The US federal debt is growing each year. Political rhetoric by democrats, republicans, and independents all agree the debt needs to be alleviated, but meaningful, lasting change is yet to be seen. Congress and the president have added debt limits and other rules to the budgeting process in an effort to curtail the deficit, but again, these efforts have not resulted in sizable debt decreases. State governments have balance budget requirements, annual or biennial depending on their

budget cycle, making their situation much different than the federal government. The obligation to have a balance budget puts many pressures on states; however, they have found ways to cope like rainy-day funds. States engage in more questionable methods that trick the books into showing favorable outcomes – disregarding small deficits, accelerating tax collections, delaying expenditures, or playing with the definition of deficit. State governments have also found ways of securing their financial stability by altering financial arrangements with local governments – demanding localities perform new services without state funding, taking local revenue, and by granting less financial aid to local governments.

## Approaches to How Politics Influences Public Budgets

Overall, the literature offers five approaches to understanding how politics enters the budgetary process: reformism, incrementalist bargaining, interest group determinism, process, and policymaking (Rubin 2014). Each of these approaches captures a piece of the budgetary process. While no approach can capture every element, there is much to be learn by isolating specific components. The five approaches are explained below; however, for further discussion see Rubin (2014), Chapter 1.

The *reformer orientation* approach views budgets as technical documents that work to achieve efficiency and effectiveness. Politics – like self-motivated elected officials and interest groups – deteriorate the rationality in budgeting decisions. In this approach, professionalism clashes with politics. Professional public administrators work to produce a technical budgeting document, while elected officials and other interest groups want to see their politically favored groups secure financial resources.

The *incrementalist* perspective acknowledges the routine nature of the budgeting process – each year (or biennial budget cycle), a common group of actors come together to negotiate a budget. In this simplistic view, there are many actors, the process is open, and there is minimal conflict because each actor has at least some victories in the final budget document.

The *determinism* approach, unlike the *incrementalist* perspective, is conflict intensive. This approach illustrates how interest groups can dominate the budgetary process. Generally, this view says it's the rich and powerful that rule government decisions. Democracy is broken down since industries and special interests are represented instead of the good of the people. Potentially, this model can lead to big winners and big losers in the political landscape.

Fourth, the *politics of process* approach says the actual budget *process* is the central political battle. The process can provide a clear path or one full of obstacles to seeing budgetary requests realized. The process can be a battle between two branches of government. The best example of this is observed in the history of the US budgetary process – it has been characterized as a struggle of power between the executive and legislative branches. Since the late 1700s, processes have been altered to allow for either presidential or congressional control over the budgetary process, whatever the public sentiment was for that period of time. Aside from the two branches, the process can favor agencies by the amount of scrutiny their budget justifications receive. Citizens can experience increased transparency based on the budgetary process. For example, some budgetary processes emphasize participatory budgetary decisions and value citizen input.

The last approach to politics in the budgetary process is *policymaking*. This says that all budgetary decisions come down to policy decisions – whether that be on revenue collection or expenditure choices. A big part of policy development is tradeoffs of what government will do and not do – priorities must be made. The budget can be a tool to help compare programs and make policy decisions.

## Conclusion

In summary, the public budgeting process is unique in how it functions to provide goods and services by governments. Politics influences

decisions on public expenditures, tax revenue systems, and how the budget is balanced. Scholars have further theorized on several different approaches to how politics enters the public budgeting process. By studying the public budgeting process, it becomes clear that budgets are not just numbers on a page but representations of political battles of the day.

# Budgetary Principles

Anna Francesca Pattaro
Department of Economics Marco Biagi, University of Modena and Reggio Emilia, Modena, Italy

## Synonyms

Budgetary practices; Budgetary rules; Budgetary values

## Definition

Budgetary principles represent values and rules that need to be considered and/or accomplished when preparing, executing, and analyzing the budget of a government or a public sector entity. Therefore they indirectly affect different aspects of the budgeting process and the budgeting cycle, as well as many other issues of public administration.

They differ from budgetary constraints, like those imposed in some countries to governments or specific public sector entities in order to comply with some general macroeconomic targets. Examples of budgetary (or fiscal) constraints are those imposed by the European Union under the Stability and Growth Pact.

While different budgetary constraints, as budgeting techniques, might be used according to specific contingencies, budgetary principles have general value and can be applied to all governments and public sector entities, regardless of particular circumstances.

## Introduction

In the last three or four decades, and in particular in the last few years after the 2008/2009 economic and financial crises, the main concerns of most governments all around the world have been policy planning and the control of public expenditure. Budgeting, auditing, and evaluation have been significant instruments for the pursuit of those goals.

Therefore, as Gray et al. (2002) state, given the relevance of budgeting in a public sector entity, it is fundamental to build up a logical, organizational, informational, and social integration of budgeting with auditing and evaluation under several preconditions that can be technical, organizational, political, and constitutional. In effect, budgets allow to manage, coordinate, and plan different activities related to different policies, while audit permits to guarantee both the financial control and the accountability of the use of resources; finally, evaluation consents to promote economy, efficiency, and effectiveness of action. In addition, budgeting, auditing, and evaluating have been used by different governments to strengthen control planning, and accountability in the policy process, despite of diverse political

cultures and environments influencing national patterns in fundamental ways. These functions have been regarded as central both to the cohesion of the political system and to sustaining of economic growth (Gray et al. 2002).

The present entry aims at presenting the main issues concerning budgetary principles as foundations of budgeting process, budgeting cycle, and budgetary governance.

First the entry focuses on budgeting process and on budget document, and then a brief presentation of the relationships among financial management, financial viability, and budgetary rules is highlighted. Afterwards, the main principles for a successful budgeting process and budgetary governance, then for sound financial management and budgeting, are pointed out. Finally, after some short references to reforms, austerity drift and the influence of consolidation on budgetary rules, conclusions are presented.

## Budgeting Process and the Budget Document

As above mentioned, budgeting is a basic managerial and political process, while the budget is a document resulting from budgeting process. Both budgeting and budget are characterized by a significant level of complexity.

In effect budgeting is a process endowed with different functions; actually, it has a political, a financial, and a managerial function.

As Gray et al. (2002) point up, budgeting can be considered as related especially to how to distribute resources among competing claims, a perspective that suggests mainly an allocative aim of budgeting; alternatively it can be estimated as mainly concerned with revenue raising. Besides, budgeting is regarded both as an historical issue, since it takes place over time, and a dynamic issue, considering it is influenced by the changing internal and external political environment.

Moreover, budgeting is fundamental for planning government operations and services. It forces elected officials and public managers to early consider changing conditions, potential problems, and possible solutions. Budgeting also helps to coordinate different policies and activities of internal management, performed in different units of a public organization; it contributes to motivate managers to work hard to achieve budget goals; and, finally, it helps performance evaluation (of the whole organization, of an office, of a policy, of a service, of managers or employees, etc.).

Therefore, the budgeting process and the budget statement can be considered fundamental instruments for attracting, or on the other hand destroying, consensus of citizens and other stakeholders, since they define how financial resources will be distributed and afterwards used or allocated to several public policies purposes.

Just as budgets serve planning, coordination, control, and motivation in the management of public policies, the budgetary process acts primarily as a mechanism for integrating differentiated interests into the regularities of the political process. As a consequence, budgeting is not only a process that seeks to insert economic efficiency in the political process but also a major mechanism for ensuring political efficiency by acting to resolve competing interests (Gray et al. 2002).

The output of budgeting is a statement, the budget that sets out the results of the (political) decision-making process. In fact, as several scholars (e.g., Wildavsky 1975) have recognized, the budget is a multipurpose document, while at the same time, the process of budgeting is a multifunctional activity in a political system.

Moreover, the budget is an essential tool for internal and external accountability and communication of results and outcomes. Therefore, the budgetary process and political commitment of public money allocation are central not only in terms of authorization/entitlement of the distribution and use of public money among different projects, activities, and policies but also in terms of autonomy (both political and managerial). From the commitment issue derives the importance of disclosure of financial results, performance, and accountability toward citizens and stakeholders in general (e.g., Wildavsky and Caiden 1997; Khan and Hildreth 2002).

Thus, budget has been studied according to different scientific disciplines, e.g., political

science, economics, management, and accounting, and according to different theoretical perspectives, e.g., management theory, public finance, budget theory, and new public financial management. In addition, the budget can be considered and evaluated according to a micro as well as to a macro perspective, since it can represent, on the one hand, the activities and policies undergone by a single government or public entity or, on the other hand, those of an aggregate of governments linked through some treaty – like in the case of the European Union. This is relevant considering not only administrative or managerial matters, but also budgetary constraints or targets, such as debt or deficit values.

## Financial Management, Financial Viability, and Budgetary Rules

The economic activity of a government or different public sector entities generates money inflows or outflows measured so as to evaluate the public value they produce and in order to register the economic effect of the administration (financial management), assess the quality of the administration (financial reporting system), provide an "asset of information" useful for future good administration (planning, programming, and budgeting system), and support "managerial responsibility systems" (management control and performance management) (e.g., Anessi-Pessina 2002).

Budgeting has always been at the heart of the political process, and it may in fact be defined as the expression of politics itself, since it is in the budget that the questions of "who gets what, when, and how" are determined. As a result, the role of finance ministries (or of any public finance deputy) has a strategic position affecting the relationships with other government's departments and the processes through which these units operate (Heclo and Wildavsky 1981). In effect, the budget shows how the resources to finance expenditures will be obtained: taxes, prices, and tariffs for the use of services or public items, funds transfers, revenues from the public assets, borrowing (or issuing bonds) or liability management, securitization, and leasing. Therefore, if elected officials want to reduce taxes, they need to clarify what spending they will do without it and how they will finance it.

Then, public sector financial management involves decision-making so as public financial resources are raised and applied in the best way for the public services and interest; this decision-making involves the development of laws, organizations, and systems to enhance sustainable, efficient, effective, and transparent management of public resources. At the basis of financial management lies the core principle of *financial viability* or *financial sustainability*. In the long run, a government or public sector entity should be able to autonomously accomplish its outcomes and tasks through a balance between revenues and expenses, and it should benefit of appropriate liquidity, without depending on external (either public or private) financial funding.

*Budgetary rules* are one of the main instruments used to control government financial viability at the supranational, national, or subnational levels. They are often known, especially in the public finance literature, as "fiscal rules" (Kopits and Symansky 1998), particularly when referring to supranational fiscal frameworks. They are based on some permanent constraints on the key budgetary aggregates, such as the annual budget balance, expenditures, and borrowing. In addition, budgetary rules usually provide specific indications about monitoring, enforcing, and sanctioning if they are not accomplished. Even if budgetary rules often consist in numerical targets or ceilings for budgetary aggregates for a certain period (usually medium to long term), they differ from general fiscal targets set by governments on an annual basis for policy measures (e.g., Guarini 2013).

The *balanced budget* is a budgetary rule crucial for the financial control of a government's (or public sector entity) financial viability. If the budget is not balanced, the government (or the entity, if allowed) risks to carry-over a deficit to the following fiscal years with the risk to determinate, in the long run, a financial distress and to undermine its financial viability. This rule in many countries has a constitutional rank, and it requires

that the government cannot spend more than its revenues. The control of the *balanced-budget* rule is based on the budget balance (difference between revenue and expenditure), which evidently offers an indication of the financial sustainability of the existing level of government services (e.g., Wildavsky 1975).

## Principles for a Successful Budgeting Process and Budgetary Governance

As OECD (2014) states, the budget is similar to a contract between citizens and state, showing how resources are raised and allocated for the delivery of public services. Therefore this document might be "clear, transparent, and credible," since it must suggest trust and it must serve as a basis of accountability.

Budget allocation decisions should be conducted in a deliberative, participatory, and transparent manner, involving elected officials, public managers, and, when possible, also other representatives of citizens of societal organizations, and other stakeholders. The objective is not only to inform but also to collect some hints for expansion and/or better use of existing resources in order to improve effectiveness. Therefore, the budget cycle is a quite long process involving in several phases/steps a significant number of people in charge of different policy areas or representing specific (personal, collective, professional, etc.) interests. The bargaining process can be complex and time-consuming – Wildavsky and Caiden (1997) refer to budgets as "struggles for power" or "conflicting commitments." It is anyway important that, while complying with national laws, there might be some stability in the budgetary decision-making process.

In general, the basic steps in a standard budget preparation system are the following (Potter and Diamond 1999). The first is the determination of the economic framework for the budget year. This allows the budget department within the public entity or the Ministry of Finance in a government to determine the global level of expenditure that can be afforded, given expected revenues and the level of deficit that can be safely financed. In a few countries, such as in some EU member states, there are some fiscal rules in place that may limit total spending or recurrent spending (e.g., the "golden rule," which is a guideline for the operation of fiscal policy stating that over the economic cycle, the government will borrow only to invest and not to fund current spending). The second step should be the allocation of resources among offices/functions/policies, leaving room for reserves to be managed by the government financial department.

The third step is the preparation, by the budget general department, of a budget circular or budget draft to give instructions to different elected officials/ministries about spending ceiling and how to prepare their estimates in a way that will be consistent with the general objectives of the government or the public sector entity. Afterwards, the budget general department should receive the proposals of spending (and revenues) from the different officials/ministries. Then, there are negotiations, usually at official and then bilateral or collective levels, leading finally to agreement. Finally, step six is the Cabinet of Ministries or of designated officials' endorsement of the proposals for inclusion in the general budget that will go to council/parliament.

As OECD Senior Budget Officials highlight (2014), an effective budgetary process must take into accounts and weight the contributions of external stakeholders and of different actor that, as above reminded, can deeply contribute to budget construction (e.g., central budget authority, ministers, parliamentarians, public officials and other trusted advisers, civil society organizations and advocacy groups, and, increasingly, citizens themselves); in addition it transforms them into a set of proposals for action aiming to improve society. On the other hand, a sound budgeting system "engenders trust among citizens that government, in the broad sense, is listening to their concerns, has a plan for achieving worthwhile objectives, and will use the available resources effectively, efficiently, and in a sustainable manner in doing so." Therefore the expression "budgetary governance" refers to the processes, laws, structures, and institutions in place for ensuring

that the budgeting system meets these objectives in a sustainable, enduring manner.

In addition OECD experts (2014) highlight that, since budget systems and procedures should be coordinated, coherent, and consistent across levels of government, the principles of budgetary governance are relevant and should be applied to all levels of government. Moreover, good budgeting is supported by, and in turn supports, the various pillars of modern public governance: integrity, openness, participation, accountability, and a strategic approach to planning and achieving national objectives. Budgeting is thus an essential keystone in the architecture of trust between states and their citizens.

Therefore according to OECD (2014), some principles of budgetary governance, that can be effective at international level without contrasting with budgeting practices determined across countries in light of traditional, institutional, and cultural factors, are the following:

1. Budgets should be managed within clear, credible, and predictable limits for fiscal policy.
2. Budgets should be closely aligned with the medium-term strategic priorities of government.
3. The capital budgeting framework should be designed to meet national development needs in a cost-effective and coherent manner.
4. Budget documents and data should be open, transparent, and accessible.
5. Debate on budgetary choices should be inclusive, participative, and realistic.
6. Budgets should present a comprehensive, accurate, and reliable account of the public finances.
7. Budget execution should be actively planned, managed, and monitored.
8. Performance, evaluation, and value for money should be integral to the budget process.
9. Longer-term sustainability and other fiscal risks should be identified, assessed, and managed prudently.
10. The integrity and quality of budgetary forecasts, fiscal plans, and budgetary implementation should be promoted through rigorous quality assurance including independent audit.

Encoding best budget practices in law can guarantee to citizens and stakeholders that policymakers will follow these procedures every session. This is strictly connected with the accountability and transparency issues, i.e., with the necessity that decisions, together with their basis, results, and costs, are accessible, clear, and communicated to the wider community (World Bank 1998).

Thus, on the one hand, accountability refers to the duty of an individual or organization to answer, to be responsible, and therefore to be accountable in some way about how they have conducted their activities and how they have used the resources made available. It is strictly connected with the liability concept, so with trust. As Bovens (2005) highlights, public accountability can be internal or external; vertical or horizontal; organizational, political, legal, administrative, or professional, and it can refer to a single individual or to an organization or a group of individuals.

On the other hand, transparency broadly means to operate in a manner that makes decisions, rules, and other information visible from outside. In fact, as Meijer (2009) states summarizing literature on transparency, "the general idea is that something is happening behind curtains and once these curtains are removed, everything is out in the open and can be scrutinized." Therefore, translating this idea to budgeting, budget communications should be clear, open, and available to all public officials, the general public, and the *media*, in order to offer to stakeholders all relevant issues and complete and accurate information.

The principle of transparency must be respected at every stage of the budgetary cycle, from its establishment and implementation to the presentation of the accounts. One effect of this principle is that the budget, the amending budgets, the consolidated financial statements, and the financial management reports drawn up by each institution are in general all published.

Thus transparency and accountability are strictly related: budget transparency is an essential requisite for ensuring political accountability. Elected politicians and public officials have an accountability duty: to explain their use of resources to the public. The framework for budgetary accountability usually includes a combination of political, legal, and administrative mechanisms which vary from country to country. To sum up, transparency and accountability require those decisions, together with their basis, and the results and the costs are accessible, clear, and communicated to the wider community.

## Principles for Sound Financial Management and Budgeting

According to the Virtual Centre of Knowledge on Europe (Centre Virtuel de la Connaissance sur l'Europe – CVCE 2016), the principle of sound financial management requires to use budget appropriations in accordance with the principles of *economy*, *efficiency*, and *effectiveness*. The principle of economy requires that the resources used by the institution for the pursuit of its activities or the delivery of public services are available in due time, in appropriate quantity and quality and at the best price. The principle of efficiency is concerned with the optimum relationship or ratio between resources employed and results achieved. The principle of effectiveness is concerned with accomplishing the specific objectives established and achieving the intended results or outcomes.

The application of the principle of *sound financial management* is based on the definition of specific objectives that are measurable, achievable, relevant, and timed for all sectors of activity. The fulfillment of these objectives is monitored by performance indicators in order to move from resource-led management to result-led management.

It is widely accepted (e.g., CVCE 2016; Potter and Diamond 1999; World Bank 1998) that the main budgetary principles supporting sound budgeting and financial management, together with transparency and accountability presented in the previous session, are unity and budget accuracy, universality, comprehensiveness and discipline, realism, annuity, and specification, plus the principles of equilibrium and the principle of unit of account.

The principles of *unity and budget accuracy* mean that, for every financial year, all revenues and expenditures of a government or entity must be entered in a single document: the budget. It needs to be completed in a precise and accurate way according to the specific indications and rules of each country's legislation and budgeting system without, for instance, register expenditures not authorized.

The principle of *universality* means that the budget must embrace all revenues and all expenditures of the entity or government; the budget must be all-embracing or all-inclusiveness. Therefore all resources should be directed to a common fund and to be allocated and used for expenditures according to the current priorities of the government.

This is strictly connected to the *comprehensiveness and discipline* principles: the annual budget process is the only mechanism available, at least between elections, to guide decision-making and to allocate resources among policies. Therefore comprehensiveness requires a holistic approach to identifying problems, understanding all the links among them, evaluating possible impediments to performance, and then finding the most appropriate solutions. The *discipline* principle, coupled with economy, also implies that the budget should absorb only the resources necessary to implement government policies.

In addition, *realism* is necessary: the budget should be based on a realistic macroeconomic framework and on reasonable revenues and expenses projections. At the same time, costing of policies and programs need to be clearly determined and spending priorities established and agreed during the budget process.

The principle of *annuity*, which is designed to make it easier for the budgetary authority to monitor the executive body's activities, requires that all budgetary operations to relate to one financial

year. Revenues and expenditures are estimated for each financial year; they are authorized and executed for one financial year.

Under the principle of *specification*, each appropriation must have a specific intended use, and it must be allocated for an explicit purpose in order to prevent any confusion in authorization or in implementation phases. The principle of specification also requires a budgetary nomenclature covering all revenues and expenditures.

Lastly, the principle of *equilibrium* refers to balanced budget including the same amount of revenue and expenditure; on the other hand, it is necessary to remember that budgets are expressed in *units of account* that usually coincide with national currencies.

In addition, according to World Bank (1998), some more principles of sound budgeting and financial management could be, together with comprehensiveness and discipline (plus transparency and accountability), the principles of legitimacy, flexibility, predictability, contestability, honesty, and information.

*Legitimacy* means that decision-makers and their resolutions, during the budget process and formulation, should fit with the aims and policies of the government or public sector entity. *Flexibility* is linked to the idea of "pushing decisions to the point where all relevant information is available." In addition, *predictability* – i.e., stability in macro and strategic policy and funding of existing policy – are important for efficient and effective implementation of policies and programs. This involves attention to the balance between the short and the long run, and it requires to ensure the timely flow of funds to programs and projects. This requires a medium-term approach to the adjustment of budgetary imbalances, program development, and evaluation. *Contestability* in policy development and service provision is then necessary for greater predictability, as it ensures that existing policy is subject to review and evaluation. Also *honesty* denotes a budget derived from neutral and not too optimistic projections of both revenue and expenditure. Sources of bias can be both technical and political. It is related to the principle of *information*, since it underpins honesty and sound decision-making. In effect accurate and timely information on costs, outputs, and outcomes is essential (World Bank 1998).

## Reforms, Austerity Drift, and Consolidation

As above mentioned, financial management has been central in public sector reforms in most countries worldwide in the last three or four decades, and it has been particularly critical in the last few years. In fact, financial and economic crises, taxation shocks, and the increased requirement of public services suggested the improvement or enhancement of financial management principles, techniques, and instruments. The general tendency is to privilege austerity initiatives and instruments and principles oriented in this direction as addressed in literature on austerity and cutback management (e.g., Pandey 2010; Pollitt 2011; Cepiku and Bonomi Savignon 2012; Overmans and Noordegraaf 2014).

Another important trend diffused on the last years is consolidation. Budgetary consolidation is based on the unification or harmonization of different budgetary systems, in order to increase coordination among different governmental levels or public sector entities, through the application of some rules and schemes. It is also seen as a way to increase efficiency, effectiveness, and performance of the public sector (e.g., von Hagen et al. 2002).

Nevertheless some debate about the possible fallacy on economic growth of austerity measures based on fiscal consolidation has recently emerged (e.g. IMF 2010; Ball et al. 2011; Wren-Lewis 2011).

## Conclusion

Along this entry, it comes clear that the budget and the budgeting process are widely explored topics, since they have been studied and analyzed by different academic disciplines through several theoretical perspectives.

Besides, they have been influenced by different elements of socioeconomical or cultural backgrounds.

There can be different budgetary rules and constraints concerning different public sector entities or diverse countries, and different budgeting techniques can be adopted according to specific contingencies. Moreover, in different settings, the budget may perform a range of functions for resource planning and control.

But budgetary principles, as basic pillars underlying the preparation, execution, and analysis of the budget of any government or public sector entity, have general value and can be applied overall, regardless the circumstances, which is why it is very important to understand their content, utility, and use.

## Definition

Austerity: Disciplined and responsible uses of scarce public resources.

Budgeting: Processes and procedures to define availability of public resources and to allocate them efficiently and effectively among different uses to fulfill goals and objectives defined by the government so as to maintain macroeconomic stability.

## Introduction

The word austerity emerged in Great Britain during World War II to characterize "a policy of deficit-cutting, which by definition requires lower spending, higher taxes, or both." It has now become almost a synonym for the fiscal consolidation efforts undertaken by many countries as a result of the 2008 financial crisis. Does austerity also requires budgeting – the managing of public resources for a given set of policy objectives – to be austere? Its etymology suggests severity, simplicity, frugality, and discipline, entailing an idea of responsibility. But are not these also the characteristics of good budgeting, regardless of the circumstances and of the policies and objectives governments intend to pursue?

This entry argues that the austerity and good budgeting are two sides of the same coin. Poor budgeting, while not one of the root causes of the crisis, amplified its effects, as governments were repeatedly caught by surprise by sizeable undetected and contingent liabilities often generated beyond the traditional perimeter of central government budgets. Further, because of poor budgeting, policies developed in response to the financial crisis relied excessively on across-the-board spending cuts, since proper tools for re-prioritization and performance evaluation were either absent or, barring very few exceptions, very poorly developed and not fully integrated with the budgeting process.

After defining the key features of good budgeting as a result of the last two decades' innovations, this entry analyzes how budgeting fell short of those standards. Prior to the crisis, budgeting had remained essentially focused on the central government and not on entities and transactions outside its perimeter that were often at the origin of fiscal problems; kept ignoring the medium-to-long-term implications of today's fiscal policy decisions; and continued to rely on inadequate information because of outdated accounting and reporting systems. The entry then discusses the policy implications of these weaknesses and how these are being addressed by a renewed international agenda aimed at revamping fiscal transparency and budget governance.

## What Constitutes "Good Budgeting"?

The definition of budgeting has evolved over the last 60 years. In essence, budgeting remains at its core a set of processes and procedures that relate the expenditure of funds to the accomplishment of planned objectives (Schick 2013) or "attempts to allocate financial resources through political

processes to serve different human purposes," to use Wildavsky's 1975 words (Wildavsky 1975). These relatively simple definitions though hide a complexity and multidimensionality that need to be disentangled to understand its various phases, components, key functions, and actors. Moreover, the focus of budgeting has shifted from central and local administrations to encompass all public resources under a public financial management umbrella. Its coverage has thus expanded from the narrowly defined central government budget to all levels of government and the broader public sector, including state enterprises and public-private partnerships or PPPs (Cangiano et al. 2013).

That said, public financial management remains anchored to the annual budget calendar and processes articulated along in its four canonical phases – formulation and preparation, approval, execution, and evaluation or validation. Regardless of the political context, it involves a large number of institutions and actors: the executive and the legislature branches; central fiscal agencies – typically ministries of finances and/or treasuries, but also planning or development ministries and revenue administrations – and increasingly independent fiscal agencies such as fiscal councils; audit institutions; and, in varying degrees, civil society. It is thus a complex, inherently political, and interdisciplinary set of contextual processes, rules, and procedures that requires a 360-degree view of its ultimate purposes and objectives, each of which should not be seen in isolation. The reasons why many reforms remain to be fully absorbed and implemented is that fiscal institutions and actors still maintain a silo, if not adversarial, mentality – ministries of finance and treasuries versus sectoral ministries; central versus decentralized institutions; accountants versus economists; budgeteers versus statisticians; political scientist versus management gurus.

The key objectives of public financial management – maintaining a sustainable fiscal position or aggregate fiscal discipline, an efficient allocation of resources, and an effective delivery of public goods and services – have long been established in the literature (as recalled in Cangiano et al. 2013 and Andrews et al. 2014). They follow closely Musgrave's objectives of fiscal policy as stated in his path breaking volume *The Theory of Public Finance* (Musgrave 1959): macroeconomic stabilization, resource allocation, and income redistribution.

The last two decades have seen a set of innovations that have attempted to crystallize good budgeting so as to achieve the above objectives. These innovations have included, among others, new legal frameworks to promote fiscal responsibility, often accompanied or complemented by fiscal rules and top-down budgeting, medium-term budget frameworks, independent fiscal agencies and councils, new fiscal risk management techniques; performance budgeting; and accrual accounting and reporting. These innovations (also discussed, among others, in Cangiano et al. 2013 and Andrews et al. 2014) have been introduced on the top of more traditional set of systems, processes, and rules to counter the well-documented deficit bias inherent in the political process on the one hand,[1] while emphasizing efficiency and effectiveness in the delivery of public goods and services on the other.

However, it is being argued that in the decade preceding the 2008 financial crisis, the dominant themes of (more often than not failed) reforms were on efficiency and effectiveness in spite of the spreading of fiscal responsibility legislation often associated with numerical fiscal targets or fiscal rules (Robinson 2016). More importantly, reforms did not consider public financial management as an integrated framework so that the pendulum kept swinging between emphasis on fiscal discipline and service delivery. Only in the years immediately preceding the financial crisis there has been an increasing awareness that without sustainable public finances, the effectiveness and efficiency risked becoming secondary objectives. Nevertheless, while available long-term sustainability tools, such as the debt sustainability analysis (DSA), and implications of aging population

[1] (The deficit (and debt) bias has been analyzed and explained in the literature as a common pool resource problem (Weingast et al. 1981); prisoners' dilemma (Hallerberg and von Hagen 1997); time inconsistency; and principal-agent relationships (Kydland and Prescott 1977).)

on social security and health systems, had been further developed and refined, their liabilities – actual or contingent – were never reflected in budget documents. Partly as a result, the opportunity for strengthening fiscal positions in good times was lost.

The financial and economic crisis has proved to be quite a test for those innovations and public financial management in general. It has revealed how many reforms were far from being well entrenched. For instance, expenditure control mechanisms turned out to be weaker in practice than expected as some countries in financial distress saw expenditure arrears increase very rapidly. Even among advanced economies, government's understanding of their current fiscal position was inadequate, as shown by the emergence of previously unrecorded deficits and debts and the crystallization of large, mainly implicit, government liabilities to the financial sector, as discussed in the following sections.

In light of the above, what are then the key characteristics of good budgeting?

- First, good budgeting – much as good decision-making – requires good quality information. Public availability of clear, reliable, frequent, timely, and relevant information on past, current, and future fiscal developments is a condicio sine qua non to assess governments' capacity to meet their stated objectives and goals in an efficient and effective manner. But today's quality leaves much to be desired in spite of the considerable progress registered over the last decade (Blondy et al. 2013) both in terms of coverage of entities and types of transactions. Reporting standards have been lagging behind the rising complexity of governments' operations.
- Second, without good information the capacity to analyze the true underlying fiscal policy and its dynamics becomes a challenge. Information is thus essential to analyze the status quo, understand what led to it, and how it may evolve – in other words, the baseline – to devise and implement the appropriate policies that satisfy the stabilization, efficiency, and effectiveness objectives.
- Third, only a top-down perspective of the budget can ensure that the macroeconomic constraints are duly respected so that stabilization and long-term sustainability are re-established where needed and maintained. Without such a perspective, efficiency and effectiveness aspects risk being swept away as seen in most crisis situations.
- Fourth, key to devise on appropriate policy response is the capacity to assess the impact on the medium to long term of today's policy decisions on the populations at large, including their distributional and environmental aspects.
- Fifth, without intruding into the lively, yet at times arid, debate on sequencing of public financial management reforms, financial compliance remains the core of any good budgeting system so that policies can be executed as planned. Realistic and credible budgets need to be executed as approved and planned, yet able to adapt to emerging realities by seeking regulated amendments to both plans and executions. Victory may have been declared too quickly on the traditional expenditure control mechanism as well as on internal and external audit functions.
- Finally, accountability must be exercised at all levels via the constitutionally protected independence of audit and statistical institutions, a vibrant dialogue within the society, and public participation in the budget process.

As discussed in the following section, with a few notable exceptions, most of the countries affected by the 2008 financial and economic crisis had public financial management systems that did not reflect the above characteristics. But in most cases, even if they did, they turned out not to be as robust as expected, thus complicating an already difficult situation.

## Why Budgets Failed to Be "Austere" When the Crisis Hit?

Between 2007 and 2013, OECD countries saw their overall gross public debt to GDP ratio increased from 80% to 118% (OECD 2015).

This deterioration was particularly stark in countries more directly affected by the financial crisis: Ireland's debt ratio increased by 109 percentage points; Greece, Iceland, Portugal, and Spain saw increases between 60% and 70%. While the bulk of this deterioration was due to a generalized falling output as measured by the Gross Domestic Product (GDP) and the need to sustain the economy and in particular financial sector institutions, other factors were at play.

Most importantly, many governments failed to have a clear understanding of their underlying fiscal position. With the benefit of hindsight, this largely reflected revisions in general government deficit and debt prior to the crisis; further revisions due to the inclusion of hidden or implicit obligations to public corporations, PPPs, and other public entities that were previously outside the general government perimeter; and cash-to-accrual accounting adjustments to capture arrears and other net payables that were not captured by budget reporting systems mainly based on cash accounting.

Table 1, which is reproduced from a report prepared by the International Monetary Fund in the aftermath of the financial crisis (IMF 2012), is an attempt at disentangling the largest ten unexpected increases in general government gross debt. As shown in the Table, in these economies the overall debt–to-GDP ratio increased by more than 26 percentage points. More in detail: 26.4% of the GDP.

- Six percentage points of the increase was due to incomplete information about the government's underlying fiscal position. Hidden or implicit obligations to public corporations and PPPs generated outside the general government perimeter came back onto the government finances as the crisis struck in Greece, Germany, Iceland, Portugal, and the USA. Moreover, in a number of countries, not only those more directly hit by the crisis such as Greece and Portugal but also Italy and Spain, governments' cash-based budgeting, accounting, and reporting systems failed to control expenditure commitments, resulting in an accumulation of payment arrears.
- Almost ten percentage points of the increase reflected an underestimation of the likelihood and scale of shocks to the government's fiscal position. The unexpected fall in GDP was the most important factor, followed by the financial support that a number of countries (e.g., Germany, Iceland, the Netherlands, and the UK) had to provide to troubled financial institutions.
- Slightly less than five percentage points was attributable to discretionary policy measures introduced in the wake of the crisis. Their net impact varied across countries depending on whether their overall aim was to stimulate the economy (France, Germany, Netherlands, Portugal, Spain, the UK, and the USA) or consolidate the fiscal position (Greece, Iceland, and Ireland).
- The remaining six percentage points of the increase was due to the interactions of the above as well as other factors.

The above finding found a stark confirmation in the Fiscal Transparency Evaluation carried out by the IMF for Portugal in 2014 (IMF 2014a). In addition to a deterioration of the underlying deficits, debt increased rapidly as a result of the inclusion of liabilities that were previously excluded from the general government under the European System of National and Regional Accounts – 1995 (ESA 95) framework, as illustrated by Fig. 1. Whereas half of the recorded increased in the general government debt from the initially reported 76% of GDP in 2009 to an estimated 130% of GDP in 2014 was the result of nominal deficits and unfavorable debt dynamics, the rest was due to reclassifications of entities that were previously outside of the general government – mainly state-owned rail and transportation companies; operations related to PPPs whereby most of the financing and associated risks were initially borne by the private sector; and interventions to sustain financial institutions. Moreover, at the time of the publication of the IMF report, there was a further 12% of GDP worth of public corporation debt that remained outside the general government perimeter. Finally, expenditure arrears,

[a]Changes to the GG perimeter and financial sector intervention include the estimated impact of liabilities transferred to newly created government sector entities, taking into account operations from the central and subnational governments. As public debt is a gross concept, this neglects the simultaneous increase in government assets. Taking this into account, net debt effect amounted to 1.4 percent of GDP, which was recorded as a deficit. The EU Commission has assessed the aid element of these transfers at about 0.8 percent of GDP

largely from outside the central government budget, add a further one percentage point to debt, down from 2% in 2010, but are not included in the Maastricht debt definition.

Finally, even lacking a medium to long-term orientation, budget forecast were not very reliable even before the crisis developed as shown by Fig. 2. Fiscal as well as macroeconomic forecasts were either excessively conservative, as was the case in Iceland, or optimistic, as was the experience in Greece and Portugal.

In light of the above-recalled key characteristics of a good public financial management system, it is therefore not surprising that although not being the root cause of the crisis, budget systems acted as an amplifier. They failed in all countries, even in those like the UK with quite sophisticated systems, on at least one of the characteristics identified in the preceding section.

The common shortfalls were failure to identify the true underlying fiscal position, reflecting insufficient coverage of entities and transactions compounded by inadequate, at least in most cases, accounting and reporting frameworks. These were followed by an insufficient attention to medium-to-long-term impact of policy decisions, as medium-term budgetary framework remained more of paper exercise without being fully integrated in the budgeting processes, thus failing to impart a true top-down view to the budget. Finally, financial compliance, while formally in place, started to leak as the pressure built up. More in detail:

- Inadequate coverage of entities and transactions. Although fiscal policies were increasingly set with regard to the general government, particularly in the European context, budget documents – not necessarily the appropriation structure – continued to be focused on the narrowly defined central administration. But many problems emerged at subnational levels and with nonfinancial and financial enterprises owned or controlled by the government and its subnational layers. Lack of coordination between central and subnational governments and between government and entities owned and controlled outside budgetary appropriation had generated a degree of fragmentation that cut across all the canonical budget phases – formulation and preparation, execution, and validation – as various levels of governments followed different formulation processes, were subject to different accounting bases and reporting requirements, and were set according to many different governance arrangements often with the purpose of obfuscating to main shareholder – the sovereign government – their modus operandi and objectives.
- Outdated accounting and reporting frameworks. In spite of the progress seen in the last 15–20 years with the emergence of the revised System of National Accounts –2008 (SNA-2008) and the European System of National and Regional Accounts – 2010 (ESA-2010) frameworks, the Government Financial Statistics Manual (GFSM) and the International Public Sector Accounting Standards (IPSAS), and of the fact that macro fiscal objectives were increasingly set in national accounts terms at the general government level, as discussed above, countries continued to formulate, account for, and report their budget and fiscal plans on a cash basis. This failed to detect underlying phenomena like the accumulation of overdue liabilities but also failed to uncover large – and often implicit – liabilities related to public enterprises, social security systems, and large investment projects funded in partnership with the private sector (Blondy et al. 2013).
- Lack of a baseline scenario and of a true top-down perspective. As noted, countries did not possess good information on their underlying fiscal position and dynamics nor had a strict top-down approach to budgeting. In spite of the proliferation of numerical fiscal rules, the lack of these two instruments made most of these rules nonbinding indicative objectives that were easily bypassed. In Europe, many countries, including large economies such as Germany and France, failed to meet the 3% deficit limit of the Maastricht Treaty numerous times. Figure 3 shows the comparison between planned fiscal balances as presented in the

**Budgeting and Austerity, Fig. 3** Fiscal balances – planned in stability programs versus actual. (Sources: European Commission, Stability and Convergence Programmes (http://ec.europa.eu/economy_finance/economic_governance/sgp/convergence/index_en.htm) Actual data AMECO Database, May 2016 (http://ec.europa.eu/economy_finance/db_indicators/ameco/index_en.htm))

respective in Stability Programs and the outturn for Greece, Portugal, Ireland, and Spain. (The differences between planned and actual balances also reflect changes in the general government perimeter that has been changing over time.) The point is illustrated by the cases of Greece and Portugal by showing the objectives for the fiscal balance stated in annual updates of the Stability Program and the actual values. As the figure shows, the actual balances fell systematically short to the planned objectives, which ended up being repeatedly postponed. This state of affairs was compounded by an optimistic bias in the underlying macro forecasts (e.g., GDP growth) and key fiscal drivers. In the case of Spain and Ireland, albeit those countries had a number of years were fiscal balance outturn were better than planned, they failed to take into consideration the full costs of rescuing their financial systems.

- Short-termism. Although plans were increasingly formulated with medium-term objectives, but with the above discussed limitations, budgets remained exclusively focused on the 1-year ahead period. Medium-term objectives were not binding and largely ignored in re-setting budgets and targets in the following years.
- Poor expenditure control mechanisms. Even a poorly conceived plan has to be delivered as approved. This turned out to be a challenge as traditional expenditure controls, budget release procedures, and cash/debt management operations came under pressure and reveled another layers of fragmentation. (It may be worth mentioning that budgets experienced symmetrical difficulties in the early phase of the 2008 crisis when countries such as the USA decided to expand their fiscal stance. Excessively rigid budget procedures impeded the USA to spend quickly many of the initiatives identified under the Troubled Asset Relief Program (TARP) and the Recovery Act, as described in Geithner (2014).) Compounded by increasingly inadequate accounting and reporting frameworks, budget execution mechanisms led to the emergence of expenditure arrears, often undertaken until they reached egregious dimensions such as in Greece and Portugal but also in Italy. This phenomenon was not limited to countries affected more directly by the crisis but was a much wider phenomenon (Flynn and Pessoa 2014). As countries under severe liquidity constraints struggled with placing their debt instruments, large amount of liquidity were left idle at large opportunity costs within the banking system by subnational levels of government, social security institutions, and various extra budgetary agencies and funds.

On top of the above, countries did not have at their disposal tools to reprioritize spending in spite of the considerable efforts and large amount of information generated in the decade preceding the crisis (Curristine and Flynn 2013). Most budget systems failed to reflect performance-based information in their decision-making process (Robinson 2015). Routine review of spending programs and activities had very rarely become an integral part of the annual budget process, with the notable exceptions of Australia and the UK. Ad hoc mechanisms and processes prevailed thus failing to create much needed fiscal space or to reduce debt ratios and reducing even further the policy options available to not only the countries more severely affected by the financial crisis but also to the international financial institutions that provided financial support and help design consolidation measures, as discussed in the following section.

## Some Policy Considerations

As discussed in the above sections, many countries entered their "austerity" phase with ill-equipped budget systems. As a result, countries that were eventually more directly hit by the crisis had run pro-cyclical policies in the preceding years. Five of the OECD's seven largest economies – the exceptions being Canada and Germany – had been running very high deficits before the crisis in 2007, as reported by the OECD itself (2015). One explanation is that political economy arguments and mispricing of risk by

a drastic convergence in interest rates on sovereign debt had provided the incentives for pursuing a pro-cyclical fiscal stance. But these policies were also favored by the fact that because of ill-equipped budgetary systems – as argued on the preceding section – countries misread their true underlying fiscal positions. Short-termism and over optimism compounded this problem.

The public reporting systems failed to consider past and future responsibilities assumed by governments. The incomplete coverage of the reporting systems led to the fragmentation of the process as the assumption of commitments was shifted onto entities, such as state-owned enterprises, outside the general government perimeter. With the crisis deepened, such entities could not serve their commitments due to the fall in their revenue and had to revert to budget support. Moreover, because of an under appreciation of risks a large portion of the implicit liabilities such as guarantees issued in favor of to the private sector and other entities were called and added to the public debt.

This state of affairs had consequences on the way countries analyzed and perceived their fiscal situation and on the policies they devised to address such situation. A full discussion of the policy consequences of this course of action is well beyond the scope of this entry, but two aspects may require some discussion as they are more directly linked with budgeting. The first one is the (re)discovery of the macro stabilization functions of fiscal policy as a prerequisite to allocative efficiency and income redistribution. The second one is the definition of fiscal space and the use of public debt – properly defined – as ultimate buffer.

Financial markets were also surprised by the real indebtedness and by the difficulties of some governments. The situation raised doubts to the capacity of governments to serve their financial commitments, leading markets to react in a sharp and scathing way. In consequence, countries rediscovered dramatically the role of market discipline via widening interest rate *premia* on their sovereign instruments. Starting with Greece, and then Ireland and Portugal but also Spain and Italy, markets priced their default probability as spread vis-à-vis German debt instruments. Interestingly enough, such spreads all of a sudden also seemed to reflect the opacity of past and present fiscal information, as illustrated in Figs. 4 and 5, which although well known until the crisis hit, had not had any particular effect on the spreads. Countries

**Budgeting and Austerity, Fig. 4** Spreads of 10-years Treasury bonds vis-à-vis German. (Source: Bloomberg)

**Budgeting and Austerity, Fig. 5** Average Annual Impact of "Fiscal Gimmicks and One-off Measures" in Europe (1993–2003; Percent of GDP), and relationship to CDS Spreads in January 2011. (Source: Koen and van den Noord (2005) and Bloomberg)

thus saw their cost of borrowing increase sharply as revenue collection collapsed, de facto preventing them from borrowing on international markets. The most glaring cases were Greece, Ireland, and Portugal that has to rely on financial support – and the associated conditionality – of the European Commission, the European central bank, and the International Monetary Fund.

Reducing the deficit by adopting "austerity" measures became thus the mantra. The general consensus and market perception were that without regaining control of public finances, the access to financial markets would not be reestablished. But because of the noted weaknesses in their budgetary systems, countries did not have that many options, even considering the

time dimension. They had thus to rely on expenditure consolidation measures. Further, this approach was also deemed more appropriate to address the deficit bias that had generated a pro-cyclical stance prior to the crisis by attacking the very source of the problem. Moreover, the time dimension was crucial and revenue measures were largely used as a stop-gap device to bring public finances under control while allowing more structural measures on the expenditure side to be designed and approved.

Poor budgeting led these countries to follow pro-cyclical policies, both in times of plenty and in times of crisis. In the first case, poor budgetary systems did not revealed how prodigal the policy was. In the second case, a pro-cyclical policy had to be followed to regain control of the fiscal variables. Accordingly, poor budgeting exacerbates the cyclical effects and the impact of the crisis.

Regaining control over public finances reverted the emphasis that had been attached by many OECD countries to reform their budgetary systems in the decade prior to the crisis with a view to enhance the service delivery aspects. While still important, overarching macroeconomic stabilization objectives had taken a back seat, although the period also saw the development of top-down budgeting, fiscal responsibility legislation and fiscal rules, and medium-term budgetary frameworks. But the emphasis on performance in service delivery or value-for-money in the need fell short of expectations; countries found themselves without appropriate prioritization tools when the time came to reduce spending with the result that blunt across-the-board expenditure cuts were one of the few viable options in the immediate needs (Raudla and Savi 2015). As budgeting in the end revolves around a relatively small amount – typically 5–10% at most – reducing spending turned out to be more complex and time consuming than initially thought. It also faced constitutional challenges, as was the case in Portugal where the government tried to implement across-the-board cuts on public wages and pensions paid by the public sector, which were considered unconstitutional by the Constitutional Court. (As noted, similar considerations applied in the cases, such as the USA and the UK, where the initial reactions to the crisis was to expand the fiscal policy stance by increasing spending, as described by the former US Secretary to the Treasury (Geithner 2014).)

With the recognition that macro stabilization was a prerequisite to fiscal policies' allocative and effectiveness functions, very few countries could rely on prioritization mechanisms based on performance information. The first reason is that the use of performance information, if available and usable, to decide where and how to cut expenditure requires a political compromise that in turn needs lengthy discussions and negotiations. As most countries had relied on incrementalism, this triggered soul searching debate on the very role of the state within an economy and relative responsibilities across layers of government. In most situations, there was simply no time for such debate. A second reason is that, in a crisis situation, the needed spending cut is sizable and across the board cuts are seemed more feasible and perceived as fairer. An exception to this is the case of the UK, where the Chancellor of the Exchequer, in a speech in June 2010, highlighted the need to cut expenditure by £ 32 billion per year by 2014–2015 relying on performance information.

Regaining control on public finances by acknowledging the true costs of carrying out ongoing policies and reflecting the implications of today's policy decision on future generations has helped consolidation measures while regaining access to borrowing. The redefinition of fiscal space became thus crucial so that along with deficit reduction there could be use of borrowing as a natural buffer against unfavorable future developments. To avoid past mistakes, however, budgetary systems will have be to be upgraded so as to become austere.

## How Can Budgeting Become Austere Again

After re-establishing the access to financial markets, countries most affected by the financial crisis have yet to put their public finances on a sustainable long-term path. This requires sound and affordable policies; a better institutional

governance for the public sector; and different organization and management of government sector.

First, countries need to design fiscal policies in line with their needs and compatible with the resources available in a long-term perspective. This point is crucial. No matter how strong the budgetary frameworks, countries are bound to face problems if a sufficiently long view of the implications of their policy does not become standard practice.

The second element is an institutional governance of the public sector. An adequate governance implies the reinforcement of the top-down structure and lining up the incentives of the budgetary managers with the objectives defined at the center by the government. This implies accountability at all levels and across all public entities and requires disclosing information on their activities in a transparent manner and to accept responsibility for the results achieved. Hence, accountability cannot exist without a proper and transparent accounting and financial information. Providing transparent information should not, however, be confused with disclosing large amounts of data. To be transparent, the information needs to be concise, appropriate, truthful, and useful and be released in a way that can be properly understood and interpreted. This may require differentiated documents so that both the public at large, by way of citizens' guides, and the initiated professionals that rely on detailed and highly technical financial statements drawn up on the basis of internationally accepted accounting standards can be satisfied. This means that the information presentation should be adapted to the public.

The third element links the definition of policies with the governance process, in essence the public financial management tools and innovations discussed earlier. Without such tools there remain the risk of a fragmented and opaque public sector, where risk are not disclosed – let alone manage – and accountability and responsibility a mere declaration of intent.

Most, if not all, of the characteristics of good budgeting summarized in section "Why Budgets Failed to be "Austere" When the Crisis Hit?" had been enshrined in a set of principles, code, and diagnostic tools developed by international financial institutions in the late 1990s. These include the IMF first code of fiscal transparency, issued in 1998 as part of a set of 11 similar codes that covered the entire spectrum of economic activities; and the 2002 OECD best practices of fiscal transparency (OECD 2012). They were also reflected in a number of public financial management diagnostic tools, the most successful of which was and remains the Public Expenditure Financial Accountability Framework (PEFA), a partnership formed in 2001 between donor agencies and international financial institutions, aimed at assessing and scoring countries' performance in this respect. As history has a tendency to repeat itself, those instruments were developed in response to the Asian crisis, although much of their thinking had been developed in tackling the transition of planned economies to a more market friendly regime.

After initial success and some progress, many of these instruments showed sign of maturity and eventually ceased to play an active role (IMF 2012). In part this reflected the voluntary nature of these exercises, in addition to some degree of reform fatigue. It is in fact not surprising that the instrument that seems to have fared better is the PEFA, largely because in addition to its merit, it has now become a mandatory trigger for EC and some bilateral donors to provide budget support to low income countries.

As in the wake of the Asian crisis, there has been a renewed effort on the parts of international institutions to redefine the way budgeting should support fiscal policy-making. In particular, there has been a special emphasis on fiscal risks. These are defined by IMF (2012) as developments and events that prevent countries from achieving their set objectives. Two such initiatives deserve credit: the IMF's new Fiscal Transparency Code (IMF 2014b), and the OECD's Principles of Budgetary Governance (OECD 2014a).

In the European Union, new standards and rules have been introduced to promote transparency and fiscal responsibility. The introduction of the ESA in its 1995 version and more recently with its 2010 upgrade version set a common standard to assess public finances, although these

systems were primarily developed as national accounts systems. The adoption of ESA increased the comparability between the fiscal positions of different member-states enhancing transparency of public accounts

As reaction to the sovereign debt crisis, the European Union decided to strength its fiscal surveillance mechanisms and define more strictly fiscal stability. The Treaty on Stability, Coordination, and Governance and the so-called six-pack introduced in 2012 and 2013 reinforce the rules already defined in the Stability and Growth Pact and define sanctions to noncomplying members states. These rules apply to both the fiscal balance and the debt.

In terms of fiscal balance, member-states should reach a fiscal balance close to balance or in surplus. In the path to reach a close to balance or in surplus position, the country should reduce its fiscal structural deficit by 0.5% of GDP each year. The Treaty also includes a rule for countries with a public debt ratio to GDP higher than the threshold of 60% defined in the European Union Treaty. In this case, a country must reduce its debt ratio by 1/20 of the difference between the actual ratio and the 60% threshold, per year, on an average of a 3-year period.

The European rules are directed to attaining a result and constrain the definition of policies by member-states. These rules can be considered policy rules. However, in order to achieve a long and lasting result in consolidating public finances it is needed to combine these policy rules with an improved and transparent governance and with a budgetary process and machinery that supports and applies these fiscal rules.

To complement this new set of rules, there has been a movement towards the introduction of independent fiscal institutions. Although, the functions and competences of these institutions differ across member states, the assessment of the compliance with the European rules falls under their statutory. Other functions they perform include assessment of debt sustainability and of the medium-term fiscal plans.

The above initiatives have already produced some results, as illustrated by the OECD's Budgetary Practices and Procedures database (OECD 2014b) and in the first wave of Fiscal Transparency Evaluations carried out by the IMF since 2013. More countries have introduced a top-down approach to budgeting, various forms of medium-term budgetary frameworks, and overall better reporting of fiscal developments, although the international debate on public sector accounting is proceeding at a very slow pace. There has also been a proliferation of fiscal rules and councils, mainly concentrated in Europe, as a result of the EC fiscal compact requirements. This said, fiscal risk management remains in its infancy and many of the reforms introduced aimed more at gaining some international credibility and legitimacy, rather than at addressing genuine problems. As such, reforms risk being driven by so-called international best practices and thus repeating past mistakes. This is a risk that should be avoided.

## Concluding Remarks

This entry argues that austerity, understood as prudence, responsibility, transparency, and discipline, is at the center of any good budgetary process. Notwithstanding the improvement in the instruments of public financial management in last two decades, the 2008 financial crisis showed that in many countries the upgrading was not sufficient to prevent serious fiscal problems.

In fact, during the crisis, some governments were not prudent and promote fiscal expansions to revive the economy without having the fiscal space to follow such policy, putting their public finances at risk. Other governments assumed implicit or explicit liabilities without assessing the responsibilities and risks associated that decision As a result, many governments were repeatedly surprised by the true underlying situations of their public finances.

To regain the control and secure the progress of their public finances, countries have to continue to follow responsible policies, strengthening the management of their scarce public resources. A full understanding of countries' underlying fiscal positions cannot be delayed any further. In this regard, a further effort to develop and adopt public

sector accounting and reporting standards such as the IMF's GFSM, the IPSAS, and the still evolving European Accounting Standards or EPSAs along with a convergence across statistical and accounting standards would pave the way towards genuine accountability. As history has shown, accountability can be an elusive objective (Soll 2014). But there is a real opportunity this time for not letting a crisis go wasted so as to ensure that governments can be held accountable once and for all and be austere, as the etymology of the word requires.

## Synonyms

Financial planning; Political and administrative decisions; Resource allocation and financing

## Definition

Budgeting is the essential part of financial management in which sometimes has nonfinancial measures and targets.

A decision-making process within the public sector might be a political process in harmonizing varied/conflicting interests among constituents.

Budget reform is an institutional effort for improving in planning, control, and coordination.

## Introduction

A budget is a monetary function of a plan. In other words, it is "a definite plan or proposal for financing the business of a future period both with respect to revenues and expenditures" (Willoughby et al. 1917). All activities for strategic objectives in the plan need resources allocated for implementing them. In the public sector, especially for the government sector, the budget is prepared and submitted by the executive to the legislature for its approval. By contrast to the private sector, resources for all activities and programs in the public sector shall be determined in the budget as the upper limit. Of course the budget drafts are discussed and finalized within the government through an examination by the Budget Office or the Ministry of Finance. In this regard, budgeting is a most important and influential process in public policy and management. Also it is necessarily related to the contents and focuses on the plan. Since the 1980s, the pressures on enhancing efficiency and improving quality of services in the public sector have globally strengthened in parallel with public management reform called the "New Public Management" (NPM), which is now developed into new concepts like the New Public Governance (Osborne 2010) or the Neo-Weberian State (NWS) (Lynn 2008). In accordance with this micro perspective seeking efficiency, the global economic crisis in 2008 made the government to harmonize with macroeconomic policy. Budgetary control has moved from input control to increasingly focus on results orientation and adopted business management tools into the public sector, in addition to introducing a market mechanism. Public sector reform proposes that more flexibility in budget execution shall be given to managers in exchange of strengthening accountability for the results. It means that the roles of budgeting have expanded an annual financial plan into a more comprehensive plan in financial and performance, in addition to a longer term. However, as Wildavsky (1978) indicated about 40 years ago, these progressive reform ideas, which are proposed as a public financial management reform, have not caused so far the intended outcomes; rather, the current situation is considered as "the traditional budget lasts."

This entry offers a fundamental knowledge about budget decision-making. In order to understand the difference between ideas and practices in decision-makings, we first briefly review the nature and purposes of budgeting in the public sector. In the third section, from the perspective of political decision-making on budgets, theoretical and analytical models on budgeting are presented. The fourth section discusses about principal constituents in the decision-making, identified as politicians, bureaucrats, citizens, and interested parties. Also, it shows that the budget process is a series of decision-making and control procedures within public finance. In the fifth section, several approaches on budget decision-making are presented and compared in strengths and limitations. Finally, some conclusion is summarized.

## Nature and Purposes of Budgeting

Budgeting is, as described earlier, a financial plan to achieve the strategic goals, whether in the public or private sector. Budgeting in the public sector, however, has a specific nature from the perspective of democratic control to the government. Public goods and services, like roads and police services, are not traded in a market by contrast to the private sector. As Jones and Pendlebury (1992, p. 3) mentioned, they have the feature that "the enjoyment of (their) benefits cannot be withheld for non-payment."

The funding for providing public services comes usually through taxation and fees, which are enforced for citizens. Paying taxes is considered an obligation for citizens whose benefits are not necessarily matched with costs or tax burden. For example, citizens earning higher salaries pay usually more taxes than other making lower income, in exchange of delivery of public services, like police patrol, which is a universal service and free in using for every citizen. In other words, benefits and costs in the public sector are not matched by individual person or trade, in contrast to private goods in the market. If a person buys a chocolate in a store, he or she can fully enjoy eating it. This is caused by the character of public goods/services called "nonrival" or "non-exclusion" (Samuelson 1954); the former means that the consumption by one person does not prevent the consumption by others; the latter is that while in theory exclusion in consumption is possible, in practice exclusion is not enforceable or impossible. Public goods and services exist when market mechanism does not work well, i.e., in market failure.

However, there are limitations on tax revenues in contrast to growing demands for public services, although the roles of public finance are to improving efficiency in resource allocation, redistribution of income, and economic stability (Musgrave and Musgrave 1989). Therefore, to what extent people bear the taxes or costs, who pays them, and who are beneficiaries or target population for the services are crucial issues in the public sector. In welfare state, government provides varied services whose benefits are targeted for some people such as handicapped persons, not everyone. This means a lot of requests for public expenditures have to be examined to balance with the limited funds.

People favor to consume more public goods and services with less money. In order to make priority among many requests and match expenses with revenues, resource finance and allocation for democracy adopts a collective decision-making system, where citizens directly determine the budget or the representatives discuss it in the legislature (Gray et al. 1992). It is contrastive that exchange transaction in the private sector is led by an individual decision-making between providers and consumers. In the representative democracy, the parliament or the legislative body is the political place to examine, discuss on, and approve the initial budget proposed by the executive branch. The parliament or legislature is in the public sector context, the alternative mechanism on how to fund and allocate the resources to reach the goals on public welfare, while market play the corresponding role in the private sector.

The nature of budget has three main functions (Schick 1966). The first is *planning*. Budget is a financial plan putting mission and strategy into operation. It ensures the resources to implement the plan. Unless necessary resources are allocated to the planned operations or activities, the successful results would not be caused. Also, if allocated resources are much larger to implement the plan, budgets will result in waste or inefficient money.

Forecasting and appraisal of budget proposal is consequently critical in appropriate planning.

The second is *control*. Budget is the standard or criterion in its execution and audit or evaluation. The budget approved by the legislative body is the authorized resource allocation and funding plan, which the executive has to comply with. Non-authorized budget (including taxation) is not allowed to be implemented, owing to democratic control. Budget is a critical democratic control instrument by the people against the government, through which the legislative branch delegates its execution into the executive branch, although budget control is of course limited to the unit as

authorized item. Therefore, management decisions on budget execution are based on the budget. The government and public entities are accountable for the budget and value for money in economy, efficiency, and effectiveness to the people through the legislative body.

The third is *coordination* or *communication*. Since the budget is a financial plan for strategic goals, which people shall bear the costs, there is a need to reach consensus among constituencies or tax payers. Budgeting is an adjusting and dialogue process through which budgets proposals and requests are examined, prioritized, and chosen to meet the budget revenues (Grizzle 1997). Accordingly, budget for the government has to make clear why the programs or activities are approved and why others are not approved or do not receive attention or higher priority. For public sector entities, budgeting is a tool for their employees to understand the strategic goals and share the problems to cope in financial terms.

## Budgeting and Decision-Making Theory

Budgeting implies financial decision-making in resource allocation and funding. Decision-making theory shows that decision-making is a process of transforming information into decision (Simon 1977; Kuhn and Beam 1982). From this perspective, budget reforms or innovations are to explore how rational choice for accomplishing goals could be chosen in budget decision-making, based on information. In rational theory, it is assumed that decision maker sets the goals, considers all alternatives and environment factors, assesses them, and chooses the most appropriate strategy. However, as Simon (1957) indicates, practical decision-making is based on "bounded rationality." Even if politicians or bureaucrats seek to maximize the public welfare from altruism without selfish attitude, it is quite difficult to calculate or compare the alternatives in terms of public interest due to nonexistence of market price, which in the public goods and services its economic value is reflected.

The development of the economic and rational theory caused some other advanced theories. Principal-agent theory is one of them and has been extensively adopted in the fields of political science and public administration (Lane 2005). It has advantages in analyzing the interactions and relations in the budgeting process: in representative democracy, the public or citizens are the principal and agents are politicians and bureaucrats; in addition, bureaucrats are the agent of politicians. This theory can be taken into the organization structure and institution in budget decision-making. The legislature is the principal of the executive branch, who discusses and approves the budget from the executive. The executive is also the principal of bureaucrats, who execute the budget approved. Citizens are the highest principal and vote the representatives and monitor the behavior of politicians.

Since budgeting is a political decision-making process in government sector, we can use a conceptual framework for reaching the decision, developed by Weiss (1995). At the organizational level, policy decisions are the result of the interaction among four elements – interests, ideology, information, institutional rules, and culture, i.e., "4I's." The framework is considered an integration of decision-making theory on *information*, political theory on *interests* and *ideology*, and institutional theory on *institution* and culture. Many empirical studies and experiments however show that practices differ from the forecasts or prescriptions by rational theory. Recently, behavioral science and social psychology shed light on why people sometimes make a decision based on their intuition rather than information, being useful in decision-making even though it is from policy analysis. Haidt (2001) showed that moral judgement was caused by intuition rather than reasoning based on rational thinking or information. The former corresponds to System 2 and the latter System 1 in accordance with the concept by Kahneman (2011). An experimental study also found that politicians were not interested in using policy relevant information until political intuitions conflicted with the information (Demaj and Schedler 2014).

In response to the above theories, we present three primary theoretical models in budget decision-making. The first and second models

are based on rational theory. The third is historically based on bounded rationality and behavioral model (Cyert and March 1963). Firstly, Niskanen (1971) indicated the budget maximizing model by bureaucrats, based on public choice theory, in which each player in political arena seeks to maximize its utility. The model assumes that the bureau receives resources from the government (sponsor) and provides services. Given the budget constraint, which the total costs are covered by the sponsor owing to information asymmetry, the output level of the services are larger than the social efficient level. It shows that bureaucratic behavior causes inefficient results in budgeting. The model however does not analyze the budget process within the bureau, namely the interactions between budget proposals or spending departments and budget examiners. Dunleavy (1991) developed the second model keeping the principle of utility maximization by the bureau. Exploring the behavior of bureaucrats and interactions between politicians, he developed the bureau-shaping model that bureaucrats are interested in the nature of the work. Therefore, it is assumed that senior bureaucrats or the group of high-ranked officials place a greater value on policy-related works over operations or providing services. This type of bureaucrats maximizes their utility through engaging in policy-related work rather than seeking the size of the organization or budget. The model explains why downsizing through privatization and "agencification" in the public sector has been promoted by senior bureaucrats in cooperation with government.

The third is the aspiration model based on a behavioral theory. Originally the model was developed considering the enterprise behavior. As a result, until recently no scholar adopted the model into the public sector. However, aspiration model explores how organizational goals are set in the decision-making process, in other words, how budgets are determined. In the original model, it is presumed that aspiration levels depend on the prior aspirations, prior performance, and the experience of comparable organizations. Nielson (2014) adapted the aspiration model in public schools and found that the prioritization of goals was related to the reported underperformance. Thus, this model could explain how budget decisions are made in using performance information and expectations: budget is considered a joint product of future, historical and social aspirations, not a result of the rational policy analysis.

## Budgeting Process and Decision Makers

The budget process is a cycle of management and decision-makings usually called "budget cycle." The process is generally composed of budget request, budget review, budget submission, approving budget, budget execution, accounting, auditing, and feedback to the next budgeting. There are multiple cycles in any organization: organizational level, department level, and section or division level, which is the budget unit. In case of government, the cycles consist of state level, ministerial level, bureau/department level and division level, which is ordinarily the budget unit. In the public sector, owing to the democratic control, budgeting process and procedures are regulated and institutionalized by the constitution and by law. It is contrastive that budgeting is an internal management process in the private sector: in case of corporations, budget decision is made by the board of directors; there is no need to be approved in the general meeting of shareholders (Jonsson 1984).

Primary stakeholders in budget decision-making for the government are the executive and the legislative branches, in addition to citizens and interested parties. The character of public goods and services provided by the government needs political decision-making on resource finance and allocation in amount, quantity, and quality. Budgeting as a political process (Wildavsky 1964) ranges not only the stage from budget requests to budget approval but also the stage of execution, accounting, and auditing. The former stage is a struggle for acquisition of resources and the latter is related to how the people and its representative legislature (as the principal) monitor and control the executive branch (as the agent) in its execution, in order to be complied with the budget and regulations. In other words, the

decision on who bears the costs is to determine the resource financing policy and likewise the decision on who are beneficiaries or what is the objectives of public services is to set up the policy of resource allocation.

Especially the nature of nonexchange transaction between taxation and public services leads to political resolution in budget decision. In a representative democracy, the primary decision makers are politicians in the legislature because citizens delegate the mandates in budget decision-making to the legislature. However, in practice bureaucrats or departments in the executive branch prepare a budget draft and the interested parties could approach politicians through the department in an iron triangle. Therefore, the divide between benefits and costs shall be coordinated with a collective decision-making place where stakeholders other than politicians are also involved.

Wilson (1980) indicates public services might be classified into four types in terms of the distribution of costs and benefits (Table 1). The number and strength of people involving in political confrontation differ by the type. For example, when the costs and benefits of a public policy are concentrated, the number of stakeholders involved is limited; however, the strength is strong: interest party politics will appear. Whether or not a policy will be adopted or approved in the legislative branch depends on the political relations between beneficiaries and cost bearers among stakeholders.

## Budget Models and Reforms

Budget reforms are considered a series of changes transforming the traditional budget system into a more rational and reasonable model. The traditional budget is featured as input oriented, line-item based, one-year term, and centralized system. Incremental budget (Lindblom 1965) is a revised model of the traditional budget system. The budget increases or decreases in X% in expenditures for the coming fiscal year over the budget for current fiscal year. The model presumes that the current budget is generally efficient and the relationship between budget and policy outcomes is stable.

After the Second World War, policy analysts in the United States, originated from operation research in military affairs, developed a new budget system called the planning, programming, budgeting system (PPBS). It is an integrated system of strategic planning, budgeting, and assessment. In other words, by contrast to the traditional system, it is result oriented, output based, long term horizon, although centralized or top down (Schick 1966).

In PPBS, in order to accomplish the strategic goals, all possible alternatives are examined in terms of efficiency by calculating the costs and benefits in accordance with rational decision-making. Then the best alternative is chosen. The system was introduced in budgeting for fiscal year of 1968 to the federal government. However, due to difficulties in calculating benefits of public policy and the nature of politics in budgeting, PPBS was discontinued in 1971.

Efforts for rationalizing budgeting system have continued in the United States. In 1973, Nixon administration introduced the management by objectives (MBO) into the government. MBO was a management tool for corporations founded by Drucker (1954). It focuses on how the objectives are achieved in most efficient way. The core idea lies in the linkage between objectives and activities or programs. MBO did not use cost-benefit analysis, taking into consideration of feasibility. However, it also faced measurement

**Budgeting and Decision-Making, Table 1** Distribution of benefits and costs

| | | Costs of policy | |
|---|---|---|---|
| | | Concentrated | Dispersed |
| **Benefits of policy** | Concentrated | *Interest group politics* | *Client politics* |
| | Dispersed | *Entrepreneurial politics* | *Majoritarian politics* |

Source: Wilson (1980)

problems, by contrast to the profit sector: what is the objective of a public policy, how to measure it, and to what extent the policy is associated with the objective. In 1979, Carter administration adopted the zero-based budgeting (ZBB) into budgeting in the federal government. ZBB was developed by Pyhrr (1970). ZBB assumes that all activities and programs shall be assessed and justified in terms of effectiveness and priorities provided being zero base of current expenditure. Like in case of PPBS, ZBB also showed infeasibility in its implementation, while MBO and ZBB adopt a bottom-up and decentralized approach.

Since the 1980s, a new movement, NPM, has been actively adopted in the UK, New Zealand, and Australia, owing to economic pressure and fiscal stress. In this decade, public sector reform in the United States was not a major concern in politics; by contrast to the previous two decades, higher priority was paced on foreign policy. In the Commonwealth of Nations, output budgeting in financial management was introduced to strengthening accountability for results in exchange of greater autonomy in resource management: managers are accountable for outputs, not inputs, and have discretional power how to allocate the money into operations given the approved budget by output. Although the movement was not originated from the United States, Clinton administration in 1993 was interested in the concept, which was admired in Osborne and Gaebler (1992)'s *Reinventing Government*. The National Performance Review led by Vice-President Gore to introduce the ideas into the federal government. Especially, it is noteworthy that performance-based budgeting linking performance to budgeting was enacted in the Government Performance and Results Act of 1993. Previous reforms were implemented by the executive orders not by legislation, despite a political process of budgeting between the executive and legislative branches.

These budget reforms and models are basically closed systems within the government and based on representative democracy, while NPM has partly a participation model by citizens as customers through satisfaction survey and a market mechanism. A budget system which citizens or people participate in budgeting or budget decision-making was advocated and introduced in some nations (Röcke 2014). The participatory budget is an open budget system through a direct democracy. The budget system is basically split to partially admit for a type of public involvement in budget decision-making, allocating some resources as a community budget. The movement has potential for realizing a more democratic society, while it is so far limited and has little influence on budgeting.

One may say that the budget in practice nowadays is a mixed of the above models, regardless whether in developed and in developing nations.

## Conclusion

For a long time, budgeting in the public sector has been reforming to improve the decision-makings more rational to reach the strategic goals. A new system and idea appears, is implemented and fails, and then other innovative system replaces the current system. It is a budget reforming cycle. The cycle is generally caused by the specific nature of difficulty in measurement of performance and political process in government budgeting. Providing information, including performance and accrual-based financial information, to politicians does not always improve their decision-making. Some research (e.g., Pollitt 2006) indicates politicians do not use such information in budget decision-making. The budget in the public sector is partially a result of collective decision-making, seeking majority support reflected in the political belief, which is often prior to the rational thinking. Also to what extent the several innovative budgetary models are adopted in the government and in the public sector depends on the public administrative system, which is basically guided by the *Rechtsstaat* model in the Continental Europe, "respecting for the authority of the law," or public interest model in Anglo-Saxon nations (Pollitt and Bouckaert 2011).

In this entry, it was not our intention to support that budget reform or rationalization in budgeting does have no meaning in improving public sector

performance and social welfare. Still, we have offered some indications that the budget reform has been an experimental and innovative process towards a better decision-making and better budgeting in democratic governments.

Consequently, further investigation is needed on how politicians and bureaucrats interact and make decisions in budgeting and on whether rational methods could affect decisions and behavior in a political setting. Especially in terms of democracy, the perspective from discursive or deliberative politics in budget decision-making shall be explored other than rationality originated from economics and behavioral science.

### Synonyms

Budgeting in the public sector

### Definition

Budgeting can be defined as the statement which sets estimations for revenue and expenditure for a set period of financial year.

Public finance is the study of finance of public institutions as well as the broad objectives and rationale of the government activities.

### Introduction

The government has economic policies, which are basically reflected in the budget. Through the budget, the government of a country mobilizes and allocates resources, accelerates capital formation, and creates greater employment opportunity and equal distribution of resources. In addition, budget is an annual statement of estimated revenues and expenses. The term "budget" is derived from a French word, *bougette* meaning a pouch, bag, or wallet. In 1873, the term for the first time was used in its present form, in a satire directed against Robert Walpole's annual financial plan. Since then, the budget is used for an annual financial plan, containing income and expenditure of the government (Bhattacharya 2007). However, the entry is to briefly discuss the different aspects and classification of budget and to explore the nexus between budgeting and finance.

### Aspects of Budgeting

There are mainly three aspects to the understanding of the budget, such as resource allocation, the satisfaction of social and political demands, and the securing of political and social support (Cheung 2011). However, the primary role of the budget is to ensure the fulfillment of the financial, economic, and political aspects of the outlays. The financial task refers to spending the amounts for the purpose specified maximizing savings and avoiding unnecessary public expenditure within a financial year. The economic aspect, on the other, is a well-designed fiscal document that shows the revenues and expenditures and also consists of ensuring that the physical targets of programs have been achieved. Economically, it provides fiscal policy instruments to economic development and productive capacity of its economy, thereby affecting the well-being of the whole nation. As a planning document, it coordinates the allocation and the mobilization of public funds within the framework of government expenditure plan indicating what programs and activities will be delivered, at what levels, and with what intended results. From a legal perspective, it confers the rights and responsibilities, powers, and administrative parameters for the regulation of public expenditure (Cheung 2011). On the other side, from a political perspective, various kinds of budget actors within and between branches of government are involved in the budget making process (Lee 2016). However, there are political, economic and social priorities in the process through which the manifestoes of the ruling political parties are fulfilled (Cheung 2011).

## Differences Between Budgeting and Finance (with Reference to Public and Private Sector)

In the private sector, the budget is considered as a planning tool for financial management and control, through which the entity determines the business strategies and its future plans. On the other hand, the budget in the public sector is quite different in terms of purposes, processes, and procedures. In the public sector, the budget is a financial statement in a given period of time that is used for implementation of public policy and programs, for controlling and monitoring the activities of spending public agency, and for checking the legal compliance of political decisions made for public expenditure (Brusca and Labrador 2016). On the other hand, private sector sees revenues and expenses to estimate how much profit an organization or company will make in the ensuing days; for doing so, private sector is to reduce expenses and increase revenue to maximize profit.

In most countries, the budget sets the limit of expenditure that public agency can spend on each budgeted item. Public expenditure gets approval after a debate in the parliament, which needs the majority of votes. Thus, the budget is regarded as a point of contract between citizens and government, highlighting how public revenues are collected and disbursed for ensuring the welfare of its citizens. However, statutory frameworks highlight the balanced budget for public agency, where the estimated revenue fulfills and maintains the expenditure (Brusca and Labrador 2016).

## Public Finance and Its Classification

Finance is the fuel for the engine of public administration, as it is the first requisite for the execution of any policy or plan of the government. Public finance reflects its economic structure how it administers its financial system, such as citizens' well-being, and access to different sources of income, including taxation, public debt, or foreign assistance. It is pointed out that public finance of any country is certainly country-specific, which highlights the consequences of complex and dynamic social and political interactions, and also reflects the history of the state and its administrative capacity (Das-Gupta and Bird 2012).

Public finance is the branch of public economics that analyzes the taxation and expenditure of the government. However, public finance is evaluated from both perspectives – positive and normative. Positive analysis refers to cause and effect relationship, for instance, if the government decides to reduce tax rate on engine oil, what will be the consequences on engine oil consumption? On the other hand, normative analysis relates to ethical issues, for instance, is it good to impose high taxes on necessary commodities? (Rosen 2004).

Modern public finance stresses the microeconomic functions of government, for instance, how the government functions in an economy and the justification why the government should determine the allocation of resources and the distribution of income. On the other hand, the macroeconomic functions of the government, through taxing, spending, and monetary policies, may impact on the level of employment, growth, and price level (Rosen 2004). However, public finance is classified into main categories, such as revenue receipts or public revenue and capital receipts. Public revenue consists of all kinds of revenue receipts, collected at the given period of financial year; however, by nature it is recurring which consists of tax revenue, nontax revenue, and grants-in-aid (Karnam 2018). Fig. 1 shows the nature of public finance. It is highlighted that tax system must be capable of producing a sufficient amount of public revenue so that public expenditure can be planned and allocated for effective delivery of public services (Glenday and Hemming 2013).

## Nexus Between Government Budgeting and Finance

Public finance makes the relationship between revenue and expenditure, as the execution of any policy and programs depend on scarce money. Need connects to finance, and leads policy

**Budgeting and Finance, Fig. 1** Source of public finance

planners to seek advice and expertise from finance officials, that establishes finance officials to make critical financial analysis and its interpretation (Miller 2012). It is evident that every modern budget system contains planning, management, and control mechanisms, though they are not given equal attention in the budget cycle. In the past, the budget was mainly focused on control-oriented approach, giving much importance to the role of accountant in the budget preparation system. The current paradigm of the budgeting is a transition from accountant to economist, as budgeting takes on more of planning function (Patwary 1983). On the economical perspective, budgeting focuses on making a balance of the marginal losses of welfare to the community from tax payment against the marginal gains from public expenditure. On the stabilization function, it is highlighted that balancing of revenue and expenditures should ensure increased expenditure without impairing rather helping to materialize the national goals. However, control of public expenditure can provide either restraints or stimulus in the economy. On the distributional perspective, budget emphasizes the assessment of public expenditure incidence between public and private sectors, income groups, regions, and program-wise and sector-wise distribution. This calls for trade-off condition between allocation and stabilization and between stabilization and distribution. On the growth perspective, it is viewed that additional expenditure in priority areas or by appropriate strategy of infrastructural development may encourage further investment (Patwary 1983).

## Modern Approaches in Public Budgeting

There have been tremendous developments in budget theories and practices in the recent years as below (Hussain 2007).

*Aggregative and Development*. Information moving into the Finance Ministry is called aggregate approach, and its moving out to spending agencies is called devolution approach. The aggregate approach is pronounced in the revenue budget, while the devolution approach in the development budget.

*Incremental, Comprehensive/Zero-Based*. Incremental budgeting refers to a situation where budget estimates are drawn up on the basis of preceding year's expenditure. This is sequential and fragmented.

*Performance Budgeting and Planning, Programming, and Budgeting System (PPBS)*. The approaches were developed in the USA with the intention to improve the mode of formulation and scrutiny of budget proposals in effective programming instead of confining it to executive accountability. Performance budget gives emphasis on functions, activities, and projects. The PPBS, on the other, is advancement on performance budget in terms of concepts and mechanism (Hussain 2007). However, there have been several stages of budgetary reforms that can be illustrated by Table 1.

## Budgetary Practices in the World

Budget making is always a political process. There are varieties of budgetary practices across the world that is discussed as below (Hussain 2007).

*British System*. The British type of budgetary model is still an accepted model in many of its former colonies in Asia, Africa, and Caribbean islands. Each year the Chancellor of the Exchequer presents the annual statement to the House of Commons, which highlight the current status of the economy and future challenges and any changes in terms of revenue. However, the House of Commons has the procedural right to make debates and discussion over the budget and also scrutinize the subsequent Finance Bill, through which the budget is approved. Under the system, there is a consolidated fund which presents how much public revenues flow and public expenditure incurred. Spending public institutions are subject to different degrees of monitoring during the budget execution. It is important to note under the system the central bank act as the custodian of public money, while the Comptroller and Auditor General (C&AG) acts as both the accountant and auditor of public money.

*French System*. It is practiced in France and her former colonies. Determining taxation and spending levels of agencies get approval by the national assembly and the senate in France. This system basically adopts two approaches: financial control and central treasury management. To execute the two approaches, the system has three operational units: comptroller is responsible to monitor the financial transaction of public agencies; accountants are assigned to collect and disburse public money; and inspector of finance is responsible to supervise for both account maintenance and audit.

*Other European System*. In Europe there are many practices in varying degrees in their respective former colonies. For example, in the Italian context, the ministry of economy and finance is responsible to formulate the budget; however, there is a parliamentary budget officer who must endorse the economic assumptions applied in the budget. Furthermore, annual budget formulation cycle is divided into three parts, such as stage 1 (macro-fiscal policy setting), stage 2 (baseline update), and stage 3 (resource allocation).

**Budgeting and Finance, Table 1** Evolution of budgetary reforms

| Budgetary reform | Main reform issues | Reform orientation |
|---|---|---|
| Performance budgeting (war time–1960s in the USA) | Focuses on management of inputs and outputs; incremental in policymaking style | Efficiency-oriented |
| Planning, programming, and budgeting system (PPBS) (1960s and 1970s) | Focuses on rational planning, entailing inputs, outputs, effects and alternatives; systemic in policymaking style | Policy-oriented |
| Zero-based budgeting (ZBB) (1976–1980 in the USA) | Short-lived experiment focusing on policy prioritization | Decision-making oriented |
| Cutback management (1980s) | Efficiency reviews, cost-cutting exercises, cash limits, privatization, and contracting out | Efficiency-oriented |
| Budgeting for results (1990s–current) | Performance indicators, output targets, and evaluation | Decision-making oriented (control over total spending and efficiency in resource management) |

Source: Adopted from Cheung (2011)

*US System*. The US practice is largely five stages involved in the federal budget-making process. Firstly, the US president sends a request for budget to the congress each February for the next financial year. Secondly, after receiving a budget request, both the House and Senate committees of the budget approve the budget resolution. Thirdly, both committees determine the levels of expenses of public agencies. Fourthly, the full House and Senate make debates and discussion and finally vote on appropriations bill, and finally the US president must sign each appropriation bill, and then it becomes a law.

*Japanese System*. Under this system, *budget-making process in Japan* is initiated by its Ministry of Finance; it is preceded by receiving the estimates from line ministries and some guidelines from the Cabinet as well. Four categories of budget are found in Japan, such as general account budget, special account budgets, budgets for public agencies, and the Financial Investment and Loan Plan (FILP). However, each type of budget needs approval by the Diet which must be submitted by the Cabinet for deliberation. This system is also found in some other Southeast Asian countries with some changes (Hussain 2007).

## Actors and Interactions in Government Budget

Budgeting is a complex financial task, involving political and administrative elements. Government budgeting not only deals with public revenue and expenses but also administrative and legislative responsibilities and supporting services like audit and account functions. However, there are many issues involved with respect to budget such as centralization or decentralization of processes, unification or fragmentation of the budget, the process of revenue collection and expenditure, and the nexus between national and regional or local governments (Naomi 2011). It is stressed that the budgetary cycle involves a lengthy procedure and different actors and interactions for the preparation of the budget, which is approved in the parliament, and its implementation depends on public agencies, and its monitoring and control are achieved through public account and audit department.

### Executive

It is a common practice that political executive gives a final nod about the overall financial policy, on the basis of which estimates are prepared. Upon receiving the guideline, the concerned public agencies (e.g., Finance Ministry), with the support of various administrative agencies, prepare their estimates. After many meetings and discussions between nodal ministry and other public agencies, annual plan of expenditure is consolidated into a single document, which must be placed to the political executive for decision before placing it to the legislature (Bhattacharya 2007).

### Legislature

The legislature has a dominant role in case of approval of annual financial statement, i.e., budget, and also provides budgetary oversight. Annual plan of budget is discussed and debated in the parliament, and then the proposal is voted and adopted by the legislature, as elected representatives in the parliament are the custodian of any financial strategies and policies. However, under the authoritarian regime, the usual role of the parliament is ignored in the decision-making of the budget, and in that case, budget is approved and authorized by despotic political executive upon the practical advice and expertise from administrative officials. It is stressed that if there is no proper accountability mechanisms over the activities of government, there will certainly be challenges that sound budget policies and practices will not be performed (Posner and Park 2007). However, there are beneficial effects of the discussions among the members of the parliament on the sound budgetary practices (Lienert 2013). After the budget has been prepared at the nodal ministry (ministry of finance), it is placed to the legislature for debates and discussion in order to get approval of the budget. Discussion takes place in the parliament in two parts, public expenditure and taxation, which allows concerned agencies to impose and collect taxes. After these two bills are passed by the legislature, the executive seeks to implement the budget.

### Execution of the Budget

Once the parliament approved the budget, spending public agencies are authorized to spend expenditure within the budgetary allocation through different mechanisms, for instance, issuing notice or circular. This authorization for undertaking expenditure may be permitted for the whole financial year or for shorter periods, for instance, quarterly (Tommasi 2013). Budget execution requires administrative process, which depicts the responsibilities and function between central ministry of finance and the spending public agencies.

### Accounting and Auditing

Government accounting and auditing system is very important for the successful execution of the budget. The function of keeping accounts and auditing maintains to fulfill sound practices of financial transaction made by the public spending agencies.

## Citizen's Participation in Budgeting and Finance

In a fully functioning democracy, taxpayers have the rights to know at all stages of budget cycle how public revenues are being collected and how public funds are allocated and utilized to spending agencies and programs. It is stressed that input from informed citizens about the economic and fiscal policies can make an impact on effective functioning of public money for the public good (Karnam 2018). However, citizen's participation in fiscal policy is not a new topic that has actually drawn attention for many decades (Franklin and Ebdon 2006). But there is a huge concern how to democratize the process of budget, as democratization in the budget process may focus on direct public input as the improvement plan for the development of the budget. As justification, it is argued that elected representatives, political executive, administrative officials, or legislature cannot adequately deliver the reflections of the ordinary citizens; thus citizens need an alternative channel for sharing their opinion or suggestions before adopting fiscal decisions. In many countries across the world, there are many local pressure groups involved into the cycle of budget preparation and execution (Miller 2012). Hence, the information about budget should be freely available to all in a systematic and timely manner, as required (Mikesell and Mullins 2011).

## Conclusion

Summing up, budget is a policy document that generally shows the annual financial plan. Government budget plays a very significant role in the economic life of a country. In this sense, a budget can help people understand the economic performance of a government. It can also be a good parameter for understanding the dynamic relationship between governments and markets. The government budgeting is one of the key instruments by which the use of public resources are planned and delivered to its citizens. Thus, it can be argued that the budget is a tool of public finance for the articulation of government financial policy and programs, which present the needs of the citizens that have been consolidated into annual financial plan that is popularly known as the "budget."

Balance of revenue and expenditure; Financial management in public sector; Financial plan; Revenue and expenditure plan

## Definition

Budget is the tool through which governments decide how much to spend on what, limiting expenditures to the revenues available, and preventing overspending.

## Introduction

Budget is the tool through which governments decide how much to spend on what, limiting expenditures to the revenues available, and preventing overspending (Anessi-Pessina et al. 2016). The budget aims to turn plans and aspirations into reality. The budget thus constitutes revenue on the one hand and expenditure on theother. Budget revenues and expenditures can be divided according to more criteria and according to the customs in the given state. For example, this revolves around types of income and expenditures, i.e., tax and non-tax revenue, current expenditures (e.g., energy, services, employee salaries, etc.,) and capital expenditures (e.g., construction of motorways, purchase of police equipment, etc.). They can also be broken down by sectors where revenue is generated or where expenditures are used (for example, in health, social services, transport, culture, security, etc.) An important breakdown also exists according to whether or not the money has to be spent – it can be a compulsory (mandatory – resulting, for example, from the law) or a non-compulsory expenditure. In terms of budgeting, the budget can be balanced (expenditure equals revenue), surplus (expenditure is lower than revenue), or deficit (expenditure is higher than revenue; the state usually has to borrow in the case of a deficit – increasing its debt). The public sector should strive for balanced budgets, which is a problem for most countries.

The budget plays a key role in any public sector organization. The budget is an eclectic tool which, in addition to its basic allocation function, can be viewed from a political, managerial, and economic perspective each focusing on a particular facet or function of public budgeting (Anessi-Pessina et al. 2016).

The budget can be viewed from different perspectives, as shown in the following table (Table 1).

## Political Perspective

From a political point of view, the budget expresses the objectives of the given public policy as well as political preferences. The state budget is therefore a central policy document of government, which guarantees the prioritization of objectives and their achievement in the long (e.g., 3 year) and short (e.g., annual) term. The budget is a contract between citizens and states which shows how resources are raised and allocated for the delivery of public services (OECD 2015). Quality budgeting is a key tool for achieving good governance objectives such as transparency, integrity, openness, participation, accountability, as well as functioning as a strategic approach to planning and achieving national objective (OECD 2015). Budgeting is thus an essential keystone in the architecture of trust between states and their citizens (OECD 2015). The basic prerequisite for fulfilling these functions is the creation of tools for evaluating the results of public policies, including proposals and evaluations of alternatives. It should be noted that in this process there is a constant conflict arising from conflicting interests. We can think of budget decisions as a political arena where different stakeholder groups meet. Politicians, officials, managers, lobbyists, interest groups, and others are trying to meet their particular goals and try to amount to the resources devoted to such goals. External stakeholder groups try to influence the decision on resource allocation, so that in the end, the public interest does not have to be realized, but the narrow interests of these stakeholders do.

**Budgeting and Public Finance, Table 1** Perspectives of the budget

| Perspective of the budget | The result of this perspective (budget) |
|---|---|
| Political | A tool for prioritizing objectives, a tool for communication, a contract with citizens |
| Economic | Public policy instrument, stabilization of macroeconomic variables |
| Managerial perspective | A tool for controlling and obtaining information, reducing public expenditure |
| Purpose | Capital budget, current budget |
| Organizational and institutional | Central government budget, regional budget, local government budget |
| Approach to budgeting | Traditional (incremental) budget, performance planning system, planning, programming, budgeting system, participative budget, gender budgeting, budgeting for sustainable development goals |

## Economic Perspective

In economic terms, the budget is an instrument of fiscal policy to help achieve macroeconomic objectives. The budget function can therefore be allocation, redistribution, and stabilization. The budget is primarily a tool for affecting income distribution, stimulating economic growth, promoting employment, tackling inflation, and encouraging economic stability (Anessi-Pessina et al. 2016). In the context of the economic crisis and within the existence of supra and international organizations, budgets face other challenges as recent fiscal and economic crises have to put enormous pressures on cutting back spending, balanced budgets, and reducing the amount of public debt accumulated (Anessi-Pessina et al. 2016). Budgets play a key role in economic recovery and growth. The economical view explores how budgets are used to decide, implement, and communicate macroeconomic policies; how to meet increasingly sophisticated and heterogeneous demand for services; and how to reach a consensus on specific resource allocation as decisions becomes more and more complex warping into fragmented and continuous bargaining (Anessi-Pessina et al. 2016).

## Managerial Perspective

The management perspective on the budget addresses how to streamline the budgeting process (for example, in terms of cost of creation and

administration, the time required to prepare and approve it, as well as in terms of transparency or resistance to corruption and fraud) and how to achieve the most effective allocation (i.e., its use for the fulfillment of public policy objectives and society's needs). This trend is associated mainly with reforms in the spirit of New Public Management, the managerial part of which spurred the implementation of managerial methods used in the private sector as well as market-based tools and mechanisms. The outcome of these reforms was the emergence of new budgeting methods and an extension of the types of information that budgets bring to the management control system. In this managerial concept, the budget serves as the key accounting and managerial document at the organizational level goals (Anessi-Pessina et al. 2016). The budget is therefore to be used for managerial activities, which may be aimed at curbing public expenditure through decentralization, allocation of responsibilities and decision-making powers within the organization, determining how public goods and services will be provided, determining criteria for monitoring, measuring, and evaluating quality and efficiency of provided public services, and setting individual and organizational goals (Anessi-Pessina et al. 2016).

## Perspective of Purpose

According to the perspective of purpose, the budget can be divided into capital and current budgets. In the case of the capital budget, these are one-off, nonrecurring public revenues and expenditures of the public budget. Capital income is, for example, financial resources from the sale of investments (property). Capital expenditures are resources spent on financing investments. The capital budget can be balanced, in surplus and deficit. The current budget is the balance of public revenue and expenditure for the financial year. These are (usually) recurring income (mainly taxes) and expenditures used to finance (noninvestment) current noninvestment needs, such as energy expenditures and the salaries of public servants. The principle is that the current budget should be constructed as balanced.

## Institutional Perspective

From an institutional point of view, there are the central government budgets, local government budgets, and the budgets of specific public sector organizations. Within public finance systems, these budgets are linked. It is important to set the relationship between the central government budget and the budgets of local governments regarding the possibility of obtaining self-revenue and deciding on the provision of public goods and services. This problem is addressed by the theory of fiscal federalism, and the process of transferring competencies in providing public goods and services to local governments known as decentralization.

## Approach to Budgeting

The following budgeting methods can be distinguished: Traditional (incremental) budget, performance budgeting system, planning, programming, budgeting system, zero-based budgeting, participative budget, and gender budgeting.

**The traditional (incremental method)** perspective is based on last year's budget, which forms the basis for the budget for the next period. It is a form of budget "in which there is a high-level legislative or executive control over individual objects of expenditure in large organizations (Bagdigen 2001)". The traditional method focuses on checking whether money has been spent on items for which it has been budgeted. The problem with this method is that it ignores the assessment of public expenditure outputs and does not evaluate the proposed expenditure in terms of purpose which can lead to the risk of higher costs. The main advantage of this budgeting system is simplicity, speed, low transaction costs, conflict reduction, better controllability, and risk elimination in the decision-making process. The disadvantage of this method is excessive simplification and the inability to respond to future risks and changes in society. This approach also ignores the creation of new public policies as it focuses only on specific existing public policies (i.e., those already funded by the budget and their financial intensity verified by previous budgets)

(Bagdigen 2001). There may also be duplicity in the budget. The budget thus created provides very little information for managerial decision-making and medium and long-term economic planning.

Another variant of budgeting is called **performance-based budgeting;** the basic prerequisite of this method is the requirement for the measurability of results, outcomes, and impact. Performance budgeting, in its ideal form, is a planning-oriented system and "centralize [s] the planning function and delegate [s] primary managerial and control responsibilities to the supervisory and operating levels accordingly" (Ho 2018). This method has entered the public sector in response to the shortcomings of traditional budgeting methods. It differs from traditional budgeting methods in that budget information is collected by activity rather than by item. The compilation of the budget also includes the collection of information on achievements. The process includes regular evaluation of the fulfillment of objectives and deviations from the set budget. In practice, such a method is more likely to be used as a tool for making public spending more efficient, not as an allocation mechanism, since the use of this method faces a number of theoretical and practical constraints on the public sector. It is very difficult to achieve a link between funding and achievements. In the public sector, it is very difficult to establish performance indicators for a number of activities and collect the necessary data to evaluate the achievement of these indicators. In some public sector activities, this can be directly undesirable (for example, if the police are to collect as many fines as possible in their targets, then this is an improperly set goal – police officers use a repressive approach instead of prevention to achieve that goal). The focus on achieving an incorrectly measurable target then goes against the needs of society. Another problem is the higher incidence of conflicts within organizations that are under pressure. This type of budgeting can also lead to negative behaviors such as gaming and cream skimming. Ultimately, organizations can only focus on achieving goals that are related to funding and ignore other goals.

Another variant of budgeting is the **planning, programming, and budgeting system**. The main purpose of this method is that it links program information to planning in decision-making and the evaluation of public services on output basis. This method applicable arises in the area that public funds have limited resources against increasing public demand (Bagdigen 2001). Unlike the traditional budgeting methods, expenditure is assessed on the basis of achieving the objectives. This method also takes into account the achievement of long-term objectives and takes into account the assessment of alternatives to the proposed programs and policies. The benefits of this method include awareness of the organization's objectives, assigning responsibility for achieving objectives, evaluating alternatives to existing and proposed projects, and reducing the risk of overlapping in public spending. One of the shortcomings of this method is that, although it focuses on achieving objectives, it does not say how to achieve those objectives. Another problem is the need to implement a system for efficient data collection, which makes it possible to make decisions; it is also very difficult to evaluate the long-term effect of spending programs.

**The participatory budgeting** method is based on the involvement of citizens in deciding on the allocation (usually a predetermined part) of public resources. This method is widely used by local governments (e.g., municipalities) (Džinič et al. 2016). This instrument has been seen as one of the most successful tools for engaging citizens in public affairs in recent years. Its success or failure depends on the willingness of the local government to involve citizens in decision-making and on the willingness of citizens to participate in decision-making. There are many variants of participatory budgeting, which vary in how citizens are involved in decision-making, from the broadest option where citizens influence methodology and have decision-making competence, to the option where community funds are created, or the option where citizens only have a consultative function (Džinič et al. 2016). The benefit of this approach is citizens' involvement in decision-making and better satisfaction of local demand

for public goods and services. The disadvantage is problematic aggregation of preferences, transaction costs, incomplete information had by citizens about the benefits and costs of projects.

A very current method for budgeting is **gender responsible budgeting**, whose main goal is to ensure gender-equitable distribution of resources and to contribute to equal opportunities for all. This process means thinking about the impact on people, including women and men. Using this method, it is crucial to monitor how money is spent and whether it is sufficient to meet the practical and strategic needs of women and men, how decisions on raising and spending money affect unpaid care work and subsistence work, and the distribution of these among genders (Oxfam 2018).This method of budgeting aims to compensate for the under-representation of women in the public policy process, which in turn results in, for example, lower wages or lower pensions. Women also often work in the informal economy, where we can, for example, include care for loved ones. These activities are not subsequently reflected in official statistics based on which policy makers then decide on the allocation of public funds.

**Sustainable development goal budgeting (SDG budgeting)** aims to achieve the goals defined in the 2030 Agenda for Sustainable Development. SDG budgeting requires a close link between consolidated public budgets, budgeting, and public policies. The basic prerequisite for achieving these objectives is that public budgets will not be drawn up centrally by the budgetary authority separately from other actors. It is essential that all relevant actors are involved in the budgeting process. Governmental stakeholders, including specialized analytical (policy advising) units, such as "value for money" units, institutes of fiscal policy, fiscal councils, and oversight bodies should be more integral and proactive in fiscal management, including nongovernmental stakeholders, including, notably, civil society organizations and the media (United Nations 2019). Transparency is also very important as it increases accountability. Transparency includes the right of the public to evaluate public decision-making, including the assessment of its predictability, transparency, and rendering the government more efficient and less prone to special interests and corruption while being better focused on public value. Decentralization is a key aspect of SDG budgeting. Under decentralization, one sees the transfer of responsibility for financing the provision of public goods and services to local governments. The expected benefits are better satisfaction of local demand, better allocation efficiency, enhancement of accountability, and more democracy in society. Successful fiscal decentralization depends on factors such as the capacity of subnational governments, the extent to which central and subnational governments agree on the sharing of tasks, and the overall fiscal Framework (United Nations 2019). A prerequisite for SDG budgeting is the efficient mobilization of resources, which goes hand in hand with reducing illicit financial flows. Indeed, illicit financial flows reduce the resources needed to ensure the production of public goods and services, limiting the country's capacity to attract investors and weakening trust between citizens and the State (United Nations 2019). The state should improve revenue administration through modernized, progressive tax systems, improved tax policy, and more efficient tax collection, which should lead to improved fairness, transparency, efficiency, and effectiveness of the tax systems, including broadening the tax base (United Nations 2019.)

## Budgetary Process

In spite of different budgeting methods and different legislative regulations and practices in different countries, several key steps can be seen that are necessary to achieve the efficient allocation and use of resources. The individual steps form the so-called budget process. The budget process is not linear but cyclical and may include multi-year budgeting; this process takes place at various levels of government (local, provincial, state (regional,) and national). The budgetary process usually has the following four phases as shown in Fig. 1.

**Budgeting and Public Finance, Fig. 1** Budgetary process

The first step in the budgetary process is budget formulation. This phase includes identifying the needs and policy priorities, revenue estimation, spending priorities, and how revenue is likely to be divided among priorities and politics.

The second step is to approve the budget itself. This step depends on the specific conditions and the level at which the budget is approved. At the central (state) level, the budget usually takes the form of a legislative standard, or the budget approval process can be precisely defined by law. The budget is approved by an expressed procedure in law by a legislature which includes different levels of government.

The third step is budget execution and expenditure management. The money is distributed to spending agencies based on the approved budget. Agencies initiate spending through payrolls, the procurement of goods and services, and the purchase of capital assets and infrastructure. Information on the payments of expenditure is recorded in the accounts and is the basis for reports on the budget, which are usually compiled on a monthly, quarterly, half-yearly, and annual basis.

The last step is budget oversight and assessment (auditing). Oversight is the act of limiting the discretion of the executive arm of government by monitoring its budget management. An oversight body controls the use of public money and compliance with the legal framework related to the management of public funds (financial audit) and the delivery of socioeconomics rights (performance audits).

# Budgeting for Nonprofit Organizations

David A. Bell
Savannah State University, Savannah, GA, USA

## Synonyms

Financial estimate; Financial forecasting; Financial projections; Fiscal plan

## Definition

Budgeting in the nonprofit sector is normally defined by its use. In general, budgeting is primarily understood as a financial accountability tool as its creation and oversight are a fiduciary responsibility of the board of trustees. Budgeting is also a process to allocate resources and thereby express the priority the nonprofit organization places on related activities. In addition, it is a plan for obtaining resources and employing them in service of the organization's mission. The result, the budget, is a communication device serving these uses and more. Budgeting produces a set of promises involving a specific time period that are monetized and communicated. Nonprofit budgeting has evolved from primarily an accounting task to a device for implementing and advancing the organization's mission and strategic priorities.

## Introduction

Nonprofit budgeting practices vary as greatly as the sector is diverse. From multi-million dollar educational and medical institutions to community organizations measured in thousands of dollars, budgeting utilizes different levels and degrees of complexity and sophistication. Still, there are basic components and steps generally considered regardless to size and complexity. These components and steps are viewed through a budgeting framework (Fig 1):

A *budget* consists of monetized *credible commitments* involving a period of *time* that are *communicated* to various parties. Budgeting occurs in a *context*, much like a cake is baked in an oven. This context is comprised of *structure*, *process*, and *external stakeholders*. This context is encompassed by an *environment*, like a house exists in a climate. One view of the environment involves three factors: *economy*, *market*, and *political*. This framework illustrates the interconnectedness of budgeting with other key functions of nonprofit organizations. Understanding various aspects of the framework, such as environmental factors, is served by other sections (see "Cross-References" section below). The context is affected by this environment similar to how the temperature in a building is affected by the temperature outside. The context's structural aspect involves the organization's internal roles, relationships, and rules (activities required, prohibited, and permitted). The external stakeholders of the context are generally those not included in the structure that affect, or are affected by, the nonprofit organization (e.g., foundations, government agencies, financial institutions). It is essential that budgeting does not occur in isolation and is informed by key processes of the organization.

Budgeting in nonprofit organizations commonly involves a four-step *process*:

- Data gathering
- Preparation and approval
- Implementation
- Monitoring and reporting

**Budgeting for Nonprofit Organizations, Fig. 1** Nonprofit Budgeting Framework

These steps are performed within a *structure* that intentionally identifies and considers *external stakeholders*. Credible commitments, time, and communication are the essence of the budget. That is, the result of budgeting is a set of promises involving a specific time period that are monetized and communicated in various ways to various parties. The organization's structure employs a process to perform budgeting that includes external stakeholders.

## Data Gathering

The budgeting process begins with data gathering. In large measure it is an iterative task observable throughout the budgeting process. It is important to understand this step involves collecting more data than will actually be needed and used. This is due in large measure to the uncertainties of the environment and context. Quality data is vital to creating goods and services used to advance the nonprofit organization's mission. It is also essential for quality decisions in budgeting.

Obtaining quality data has a lot to do with the nonprofit organization's structure and budgeting approach. Depending on the organization's size and complexity, the finance staff will gather the data and may also be the repository of data provided by others. The nonprofit sector's emphasis on organizational effectiveness including both *mission* and *financial* outcome performance necessitates linkages between mission advancement and budget *resources* and *use*.

Regardless of the structure or approach, the following types of data are generally obtained:

- Strategic long-range plan (including environmental data updates for matters such as competition and challenges of resource/income dependency)
- Economic metrics and projections
- Financial statements
  - Prior budgets
  - Budget-actual variance reports
  - Statement of financial position
  - Statement of activities
  - Statement of cash flows
- Income history and projections
- Expense/cash demands-history and projections
- Program and department budget requests

Economic data could include deposit and loan interest rates, labor costs, and international currency exchange rates. Income data should distinguish between regular/reoccurring and one-time

sources. In addition, there should be distinction by type, such as annual and capital campaigns, special requests, in-kind, membership dues, and fee-for-service (e.g., government contract, sales revenue, participation fees). Also, it is important to note that cash from loans is not income, nor is cash from designated/restricted funds. Endowed organizations should include any withdrawals, but not the endowment's earnings (e.g., interest, dividends, capital gains). Expense data should include amounts by various types of expense or line items (e.g., salary, benefits, interest expense, supplies), as well as amounts by various programs/departments (e.g., member training programs, youth after-school program, public awareness program). In addition, capital expenditures should be included, such as equipment (e.g., computers, automobiles, workstations, video projection) and building costs (e.g., construction and major maintenance/remodeling). Developing projections of income and expense is discussed in greater detail in the "Preparation and Approval" section. Data helps substantiate or uncover the connection between resources that are used and achievements in advancing the nonprofit organization mission.

## Preparation and Approval

There are three budget types: *operating*, *cash*, and *capital*. An operating budget reflects detailed income and expense figures for a year, often illustrating several years. A cash budget differs from the operating budget in that it may provide less account detail and provide more time detail. It reflects the cash inflows, outflows, and balances by month for a year. The capital budget reports planned expenditures for property, plant, and equipment. It also includes expenditures such as building renovations. In general, components in the capital budget are not items purchased every year; rather they have a useful life of several years and involve a substantial cost.

Preparation of the operating budget is primarily a function of forecasting. It involves work to project revenues and expenses. When numerous departments are involved, a common format is to be used for submission to the finance office. In more sophisticated organizations, this may involve specialized budgeting software. Others may create a spreadsheet template. It is highly recommended the preparation of operating budget forecasts be computerized.

There are several ways to create forecasts when preparing the operating budget. Although it must be done with care and examination, it is not unusual for revenue projection to be based on the prior year. It is essential to consider historical revenue patterns. However, projection of future revenue must also take into account other environmental and stakeholder considerations. New or expiring grant funding, for example, needs to be considered. In addition, there are a number of quantitative methods (Zietlow et al. 2007, pp. 263–265) that may be useful for developing revenue projections (e.g., time series analysis and regression models). Expense forecasts provided by departments must be reviewed for fixed and variable components (e.g., a certain amount of building space is fixed regardless to how many children are served in an early learning center and serving more children means an increase in meal costs). An appropriate portion of the organization's overhead should be allocated to programs (e.g., fixed cost such as property/liability insurance). There are a number of methods used to compute the allocation, such as time worked allocations and amount of full-time equivalent employees dedicated to the program.

More important than the forecast computation formulas are the method and rational that resulted in the computation. For instance, the use of quality environmental data may be important to support the rational backing for a projection. Revenue projection for a member training program requires consideration of changes in local competition (i.e., other providers of training), members' sources of training funds, as well as training space capacity. Woods Bowman (2011) provides four operating budget templates reflecting organizations of different levels of complexity to illustrate budget preparation (pp. 56–62). Critical to the credibility of income and expense forecasts is addressing the matter of preparing a balanced operating budget.

A balanced operating budget is when the projected revenues and expense are equal. Producing a surplus is generally understood as an aim. This is often expressed as an increase in unrestricted net assets: assets not obligated to satisfy a commitment, or an amount owed. Some organizations use a projected contingency expense budget item to make total expenses as much as total revenue. For many, a challenge to creating a balanced budget is what Kay Snowden (2008) calls "magical thinking" (p. 19). It is illustrated by a substantial reduction in revenue for a program without a commensurate reduction in service provision and expense. The service and associated expense is continued with the hope of obtaining yet-to-be-identified replacement revenue. Operating with an occasional deficit need not be a cause for alarm. What must be avoided is a substantial disconnect from data-driven decision making that results in preparing a fictitious operating budget.

One response to the risk of preparing a fictitious operating budget is budgeting for a reserve (i.e., unrestricted net assets). The matter of creating a reserve and its size is a critical philosophical consideration for the board of trustees. The decision to create a reserve includes questions of the amount used for service provision as compared to risk management (e.g., unexpected decrease in revenue or increase in expense).

The cash flow budget is foundational to considering questions of reserve creation. It illustrates the often asymmetrical relationship of cash inflows and outflows. An example is the payment for food to prepare meals in an early learning childcare center and the time of any reimbursement pursuant to the federal Child and Adult Care Food Program. The seasonality of flows is also observable. For instance, the months when three pay periods occur for biweekly payrolls are highlighted. The cash flow budget document reports the resulting projected change in cash balances.

The cash flow budget may use any of a number of formats, such as the organization's statement of cash flows. Various models can be found in the work of Zietlow et al. (2007, pp. 282, 283, 299, 300). These authors argue that liquidity management is among the most important areas in nonprofit management (p. 23). Liquidity has various tiers and is fundamentally understood as the amount of cash available from flows, balances, and investments (p. 31). It is important to the ability to pay expenses in a timely manner. The cash flow budget can be used to identify when cash balances are the highest and lowest, including any cash balance deficits. As a result, the amount of cash needed can be identified and inform decisions on reserve creation.

Capital budgets are often projects that emerge from nonprofit organization programs. These items often involve outflows over a number of years. For example, a building construction project could extend over 1 year. Capital budget expenditures may be underwritten by a number of methods, such as cash flows, cash balances (reserves), or debt. The capital budget details all the projects under consideration. Projects are ranked on desirability. The evaluation process often involves a cost-benefit analysis that informs comparing between alternative programs and projects. Examples of employing computations in the analysis are provided by Zietlow et al. (2007, pp. 329–333).

Budget approval is the consummation of important commitments. Essentially it is a commitment of senior management and the board of trustees to provide the agreed amount of resources and those working to advance the mission to provide the agreed to services (Renz 2010, p. 637). Accordingly, it is normal for key staff to meet after data is assembled to review and refine the budget. Similarly, the board's leadership meets (e.g., budget or executive committee) for a detailed review of the budget prepared by staff and completion of final additions, deletions, and adjustments. The resulting budget is provided to the entire board in advance for them to prepare for presentation and approval at a board meeting, where additional changes may occur. The budget finally approved represents the organization's belief that resources are sufficient to provide the services and the services will produce outcomes that advance the organization's mission.

Capital budget approval involves particularly solemn decisions by the board of trustees. Clara Miller (2010) discusses how the Great Recession

negatively impacted some well-run nonprofit organizations for many years to come. From a capital perspective, two of her "horsemen" considered potentially fatal for an organization involve capital budget decisions. One is too much real estate. She explains that often real estate is valued over other capital investments, such as technology, that may be important and central to mission advancement. Another horseman is too much debt. Debt service becomes a fixed obligation that limits the organization's financial flexibility. Approval of capital budgets must carefully incorporate big picture data.

## Implementation

After budget approval comes execution or implementation. Communicating budget information is one of the first acts of implementation. This includes not only staff but external stakeholders. Membership organizations, for instance, may provide members a summary version of the budget as part of its prior year annual financial report. Foundations providing grants may require a copy of the approved budget. In addition, a financial institution providing a line of credit may require a copy of the budget. Operating in compliance with the budget is a fundamental aspect of implementation. Approval of a budget expense is not the same as approval to make the expenditure. Actual cash inflows must be considered in approving cash outflows. Approval of expenditures involves various control mechanisms designed to balance fiscal accountability and efficient operations. For example, implementation involves levels of authority provided to selected staff allowing expenses to be incurred without prior specific approval. Above that level, certain prior approval steps are involved (e.g., a purchase order – a form requesting authority to order goods/services). Budget implementation involves alignment with the expected mission outcomes and financial parameters.

A board policy with respect to transferring amounts between budget accounts is important to efficiently achieving mission outcomes within established financial parameters (Bowman 2011). This policy serves the overarching compliance responsibility of keeping overall actual income and expenses in alignment. The transfer authority approval includes a limit on the allowable transfer by management. Transfers above that limit are to receive board approval and should be infrequent. Excessive use indicates a deficiency in the budget as a plan to obtain and employ resources in mission advancement.

## Monitoring and Reporting

The final budgeting step involves observing and reporting budget behavior. It is vital to not only ensuring compliance and making needed interim adjustments but also informing future budgets. Reports for budget monitoring include the basic financial reports (statement of activities, statement of functional expenses, statement of financial position, statement of cash flow); however, the most useful reports provide information needed internally by management. For instance, budget variance reports provide detail on when actual amounts exceed or are below expectations. Sample monitoring forms and reports are provided in Edward McMillan's (2003) nonprofit budgeting handbook (pp. 29–35).

Although internal reports are essential management tools, the backbone of monitoring and reporting is the accounting system. This may be an area of concern, especially for nonprofits not regularly obtaining an independent audit, with an opinion letter. Serious problems can emerge from well-meaning, diligent staff that do not possess the knowledge to account for transactions in a manner that results in financial statements prepared according to generally accepted accounting principles (GAAP). When only the finance person understands the reports, there is a problem. Do not fall victim to this form of magical thinking. The accounting system should conform to GAAP standards, even in simple application organizations (McMillian 2003, p. 43; Zietlow et al. 2007, p. 171). In addition, the management and board should possess a basic understanding of the reports (both GAAP and management reports).

The management and the board make needed adjustments once informed by these reports. Adjustments may be policy in nature and any income/expenditure components. Nonfinancial information is important to budget monitoring and reporting. An unanticipated change in a key environmental component, for example, can impact sensitive income and expense items. Disciplined decision making is important for responding to budget variances and environmental changes. The driver of organizational activity is mission advancement. As such, the response to budget challenges cannot always be to reduce spending. The budget serves mission advancement. Decision makers govern and manage the nonprofit organization informed by realities emerging from monitoring and reporting activities.

## Conclusion

Nonprofit organization budgeting occurs in a context. The context is affected by an environment similar to how the temperature in a building is affected by the temperature outside. The essence of the budget is credible commitments, time, and communication. In other words, the result of budgeting is a set of promises involving a specific time period that are monetized and communicated. Historically, nonprofit budgeting was seen primarily as an accounting task; however, it has emerged as vital to implementing and advancing the mission and strategic priorities.

Budgeting must not occur in isolation and is to be informed by key processes of the organization. Budgeting is a process generally involving four steps:

- Data gathering
- Preparation and approval
- Implementation
- Monitoring and reporting

This budgeting process occurs within a structure that intentionally identifies and considers external stakeholders. It also reflects the increased emphasis in nonprofit organizations on effectiveness that includes both *mission* and *financial* outcome performance.

## Synonyms

Allocations of resources; Revenues and expenditure estimations; Strategic planning

## Definition

Budgeting can be defined as the process of preparing a budget, which sets estimations for revenues and expenses for future periods. It is a mechanism for allocating resources to goals and objectives of an entity and is related to the strategic plan. The budget is the financial statement prepared in order to forecast the expenditures and revenues for the budgetary period and to be used by managers and policy makers in decision-making and accountability processes. The budget can refer to 1 year (annual budget) or more than 1 year (multiyear budget). In any case, the process of preparing the budget takes place during the months before the year it refers to so that it can be used by the beginning of the fiscal year.

Governmental budgets have their origin in the parliamentary systems (seventeenth century in UK and eighteenth century in France) in which the legislative power controls the executive power. The separation of powers had relevant implications for budgeting and decision making in the governments. Budgets were designed as a tool for controlling the expenditure of the executive power and become more relevant when the participation of the public sector in the economy increased. Nowadays, the budget is an instrument for implementing the economic policy of the government: it includes policies for the redistribution of wealth, the provision of social services, and macroeconomic and intergenerational issues.

The budgeting process is a cornerstone for management both in the public and in the private sector, as it has a function for planning, coordinating, and controlling the use of resources. It must be related with the strategic plan of an organization, where the main objectives and aims have been defined. However, there are important differences in budgeting for the private and public sector; the purposes, functions, and methods are very different. In the public sector, the budget is a tool for accountability and transparency while in the private sector budgets are not public usually.

In the public sector, to define the objectives of the entity in a quantifiable way is more difficult than in a private company, and the budgeting process can be even more complex; the budget will reflect the political objectives and requires a process of negotiation. In the public sector, there is no quantitative objective similar to that of the maximization of the profit in the private sector. To provide the services efficiently would be the most similar objective. Sometimes, the objectives may be mainly qualitative, and it is difficult to quantify them and to evaluate how they are actually achieved. The measurement of outcomes is difficult. Furthermore, there is often no direct relationship between the inputs used and the outputs achieved. Because of this, the budgeting process in the public sector traditionally has been mainly focused on inputs, but in last decades some new approaches have emerged that focus on the outputs and outcomes. In any case, the resources used are mainly measured in monetary terms and cash necessities are usually considered as the basis for the budgetary process.

The budgetary process has usually been focused on the short term, with the emphasis on financial measures. The importance of the short term and of legal control led to budgets prepared with cash accounting, where items are recognized when they are paid or received, instead of when the resources are used. However, in recent decades governments have become aware of the importance of the long-term focus and that short-term planning is not enough; most countries now use annual budgets included within multiannual frameworks.

## Introduction

The budget is the main document for government management and control in which the expenditures and revenues that the entity forecast for the next year must be estimated. It represents the framework for improving the management of public administrations, preserving financial sustainability, and ensuring efficient delivery of public services.

In the budgeting process, the government has to assign the resources to its objectives and this means that it is necessary to prioritize these objectives. There are important differences between the budget process in business and in public

administrations. In the latter, the budget is a management tool but also plays an important role in the accountability field.

In this chapter, we first analyze the relevance and particularities of the budget for public administrations. The budget is considered a key document for implementing public policies and it is the document used for political debate, so the budgetary process shows important differences with respect to the business sector.

After describing these differences, we will focus on the types and methods of budgeting. In section three we analyze the steps of the budgetary process and in section four the budgetary bases, showing the differences between the accrual and cash bases of budgeting. We will then refer to the budgeting process for revenues and expenditures in order to see the main steps in each of them. We finish the chapter with the main conclusions.

## Budgeting for the Public Sector and Differences with the Business Sector

In the private sector, the budget is an essential tool for financial management and control, containing the strategies and plans of the entity. However, the role of the budget in the public sector is very different and processes and procedures are adapted to the environment in which these entities operate. There are important differences in the purpose and also in the process and methods used.

In the public sector, the budget is a document for financial management but it is also used for policy implementation and for controlling and monitoring the achievements and the legal compliance of political decisions approved. It provides the basis for authorizing expenditure and for the collection of fees and charges. In most countries, the budget has a limitative character for the expenditures, which means that it sets the maximum that the government can spend on each budgeted item. It is approved through a political process and after a parliamentary debate, which usually requires the majority of votes. So, the budget can be considered as a contract between citizens and state, showing how resources are raised and allocated for the delivery of public services. Statutory frameworks ensure that public sector organizations set balanced budgets where the estimated revenues cover the expenditures.

In public sector, the main resources come from taxation and fees so that it is important to control on what the government has spent these resources. Budgeting is a cornerstone of the trust between states and their citizens and key to transparency and accountability. At the end of the year, the budgetary reporting shows the expenditures and revenues of the year along with the differences between them and the approved budget. Thus, the budget provides the basis for budgetary control.

The main objectives of public sector budgeting are:

- To assist strategic planning and defining the objectives for the budgetary period
- To help in planning expenditures and what resources (for example taxes) are necessary to carry them out
- To implement and control policies
- To provide the basis for authorizing expenditure
- To provide the basis for budgetary control
- To provide the basis for accountability
- To measure and monitor performance

## The Budgetary Cycle

The budgeting process is constituted by a group of activities that are gathered into a cycle. The budget cycle is the whole process that takes place during the budget period.

Usually, the budget cycle has four steps:

- Budget preparation and formulation
- Budget approbation
- Budget execution
- Monitoring and control of the budget

The budget refers to a fiscal year but the budgetary cycle extends beyond the fiscal year and several budget cycles can occur simultaneously (e.g., formulation of one, implementation of a second, and control of a third).

**Budgeting in the Public Sector, Table 1** The budget cycle

| Year t – 1 | | | Year t | Year t + 1 |
|---|---|---|---|---|
| Preparation and formulation | | Approbation | Execution | Control |
| Finance department: Preparation of an initial draft of the budget | Executive power of government: Formulation of the draft of the budget | Legislative power of government: Approbation of the Annual Budget Law | Executive power of government: Execution of the budget<br>Internal control office: Internal control | Internal control office: Internal control<br>Supreme Audit Institution: External control |

Table 1 synthesizes the phases of the budget cycle:

## Budget Preparation and Formulation

The preparation of the budget starts some months before the budgetary year and needs to be based on the long-term plan prepared by the government. It is the more complex phase and requires many preparatory activities. At the moment, budget preparation must comply with budgetary stability and the limits for the expenditure that laws state in some countries, especially within the framework of the European Union.

This step requires planning and an analysis of resources and expenditure needs. In this phase, it is necessary to estimate resources and allocate them to expenditure policies, which requires to define the policies of government. Because of this, the budget formulation has many political implications. Depending on the type of budget used, it is also necessary to define the objectives, outputs, and outcomes of the planned activities, as well as the performance indicators that will be used for the evaluation of the budget. Furthermore, the formulation of the budget requires negotiation as sometimes there is a conflict between the different departments of the governments.

Before the final budget, managers usually prepare a draft of the budget, with the objective of introducing a debate about the amounts and the outcomes of the activity. Two approaches can be used by managers to prepare the budget: top-down and bottom-up, although both of them can be combined in the budget preparation (Ljungman 2009).

In a top-down budget, a total expenditure level is decided at a first stage and then the expenditure is allocated between the policies and agencies. In a bottom-up budget, the process starts with the proposals of expenditure from the agencies and through a process of negotiation the decisions about allocations are made; the total expenditure is determined at a second stage as sum of the expenditures allocated to spending units. Managers have a key role in negotiating the expenditures in both cases.

The responsibility for preparation of the budget differs among countries, but initial formulation of the budget corresponds in most of the countries to the executive power of government.

## Budget Approbation

After the budget has been prepared by the executive power, its discussion and approbation corresponds to the legislative power. In this phase, the budget is available to the public and the political debate has a great impact in the media. Parliament can pass the budget, introduce some amendments, or not approve it, with its consequent return to the government. The budget must be approved during the year prior to the budgetary period. For example, in Spain, the budget must be approved by Parliament before the first of January; if it is not approved, previous year's budget is extended.

In some countries, the budget is approved in two phases. In the first of this, the global figures, the macroeconomic environment, and the medium-term provisions are approved. In the second phase, the government elaborates the budget within the limits approved and it is discussed in the Parliament. In other countries, the global figures are approved and the discussion carried out in a single parliamentary process.

### Budget Execution

The budget execution takes place during the fiscal year. The budget legislation regulates a number of phases or steps for the execution and control of expenditures in order to be sure that it is carried out within the initial budget approved, with some differences between countries.

Although the phases can vary, some of the most common are:

*The appropriation phase*: authorizes expenditures and fixes a maximum. Appropriations represent the legal authorization to spend, and expenditures are further subdivided through an allocation process that fixes maximum amounts by the nature, program, or function of the expenditure.

*The commitment phase*: purchase orders or contracts are prepared in accordance with the appropriations, but goods or services have not yet been received.

*Registration of the obligation phase*: the goods and services provided are received, so a liability and an asset or expenditure appear. Therefore, this budgetary phase is recorded in the financial accounting system and in the budget.

*Payment order phase*: once the goods and services provided have been received and the obligation has been recognized, a payment order is issued as a phase previous to the physical payments.

The information about the execution of the budget and its comparison with the amounts forecasted are registered in the budget execution statement. This information about budget execution is useful for accountability purposes and must be published in order to increase the transparency of government actions and activities. In fact, with the New Public Management reforms, budget transparency has become a cornerstone for good governance and for achieving accountable and responsible governments. The budget must include performance measures that can inform about the effectiveness and efficiency of public expenditures. This has encouraged governments to adopt performance budgeting, as we show in a later section.

### Monitoring and Control of the Budget

After the budgetary execution, the final phase is the monitoring and control of the use of resources in order to guarantee the process as a whole. The budget execution statement is the basis for the control and must be available for politicians, citizens, and audit institutions. The statement of budget execution is presented in the annual report, which also contains the financial statements that must also be approved by the legislative power.

There is usually a double process of control: internal control and external control. The internal control corresponds to a body of the government and is a priori. The external audit corresponds to external auditors, with important differences among countries. In most European countries, the external control is the responsibility of the Supreme Audit Institutions, an independent body that must control the legality of the process and the achievement of the objectives and the performance. The result of this control is included in the audit report.

## Budgeting Principles: Budgetary Stability and Financial Sustainability

There are differences among countries in the budgeting practices, which are influenced by institutional, economic, and cultural factors. In spite of it, the OECD (2014, 2015) states that the common elements of adequate budgeting practice in countries should be a set of principles that can guide the budgetary processes.

According to the OECD (2015), there are ten principles which provide a concise overview of good practices and aim to give practical guidance for the design, implementation, and improvement of budget systems:

1. Manage budgets within clear, credible, and predictable limits for fiscal policy
2. Closely align budgets with the medium-term strategic priorities of government
3. Design the capital budgeting framework in order to meet national development needs in a cost-effective and coherent manner

4. Ensure that budget documents and data are open, transparent, and accessible
5. Provide for an inclusive, participative, and realistic debate on budgetary choices
6. Present a comprehensive, accurate, and reliable account of the public finances
7. Actively plan, manage, and monitor budget execution
8. Ensure that performance, evaluation, and value for money are integral to the budget process
9. Identify, assess, and manage prudently longer-term sustainability and other fiscal risks
10. Promote the integrity and quality of budgetary forecasts, fiscal plans, and budgetary implementation through rigorous quality assurance including independent audit

In the present environment of financial crisis and austerity, there is another budgetary principle that can be highlighted: the budgetary stability and financial sustainability. This means that budget must be balanced both in its approbation and in its execution. This principle has a special relevance in the framework of the Stability and Growth Pact (SGP) of the European Union member countries, which aims to control debt and deficit. The stability programs include the medium-term budgetary objectives for each Member State that define the limit for the structural deficit.

European Union Member States have included the requirement to adapt their budget to stability and sustainability principles in their legislation. For example, in Spain, an organic law on budget stability and financial sustainability was passed in 2012. It requires that governments approve budgets that respect the stability principle: a balanced or surplus budget in terms of the European System of Accounts. The financial sustainability principle requires a limit for public debt (inferior to 60% of Gross Domestic Product, GDP) in order to control debt. Furthermore, Public Administrations' expenditure may not be higher than the GDP growth rate. In Italy, the 2015 budgetary stability law also tries to control debt and deficit.

## Types and Methods for Budgeting

Budgets can cover a variety of activities and purposes and can be prepared following different methods. We include some possible classifications in the following paragraphs.

### Expenditure and Revenue Budgets

First, budgets can be produced for either expenditures or revenue. In both cases, we can differentiate between operative and capital budgets. Operating budgets describe the expenditures and revenues for the functioning of an organization in a given period. Capital budgeting is the process of planning for investments with extended life spans and financial resources with long-term implications.

### Annual and Multiannual Budgets

Budgets can refer either to just 1 year or to longer periods. Multiyear or biannual budgeting includes 2 or more year projections of revenues and expenditures. During this period, adjustments are made according with new information, such as decreases in revenues or unexpected expenditures. This type of budget is considered a very useful tool for planning.

Traditionally, budgets have been prepared for 1 year but in many countries multiyear budgets are now recommended and implemented. For example, in the European Council of the European Union a multiannual financial framework is used. And according to the Council Directive 2011/85/EU of 8 November 2011, on requirements for the budgetary frameworks of the Member States, each Member State shall have in place numerical fiscal rules which are specific to it and which effectively promote compliance with its obligations under the Treaty on the Functioning of the European Union in the area of budgetary policy over a multiannual horizon for the government. The directive encourages the adoption of a multiannual fiscal planning horizon, including adherence to the Member State's medium-term budgetary objective. It states that Member States must define medium-term budgetary frameworks

as a specific set of national budgetary procedures that extend the horizon for fiscal policy-making beyond the annual budgetary calendar, including the setting of policy priorities and of medium-term budgetary objectives. In the USA, the Federal Government proposed a legislation to change the budget process from an annual to a biannual cycle. The Government Accounting Office (2001) highlighted that multiyear authorizations help both Congress and the executive branch by providing a longer-term perspective for program operation and appropriations determination. However, it warns that a shift to a biennial appropriations cycle could result in reduced congressional control and oversight and make budget forecasting more difficult.

The use of a multiannual orientation has some advantages for management and planning that can improve the performance of public expenditure. In this respect, the OECD (2015) recommends closely aligning budgets with the medium-term strategic priorities of government by developing a stronger medium-term dimension in the budgeting process, beyond the traditional annual cycle.

The methods used to prepare the budget can be diverse, with varying degrees of success for each type, as there has been some evolution and fashions that made some of them more used than others in some countries or periods. Traditionally, the design of budgeting systems has focused on parliamentary control rather than on the efficiency and effectiveness of public expenditure. However, in the twentieth century, various budgeting techniques were adopted to adapt the budget to the management needs of public administrations. In the following paragraphs we briefly review the different methods used.

### Incremental Budgeting

The traditional method for budgeting in the public sector is incremental budgeting, whereby the budget is prepared considering the budget of the current period as the base, with incremental amounts then being added for the next budget period. So, the budget of a department for a year is based on the budget of the last year, which can include some incremental amounts and adjustments for inflation and planned increases in revenues and expenditures. Some authors prefer to use a line-item concept to refer to this orientation to prepare the budget.

Some of the advantages of this method are that: (a) it is easy to prepare and does not require a lot of resources, (b) it can fit well in the public sector where complex organizations operate, and (c) it is easy to understand.

However, incremental budgeting has many disadvantages, such as: (a) it assumes that current activities are still needed without analyzing them in detail; (b) budget responsible do not need to justify the use of current expenditures and do not have incentives to improve the efficient use of resources; (c) it can incentive responsible to spend the money in a noneconomic way, just to maintain the amount for next years, because probably if they do not spend this year, will be reduce the assignations for the next year; (d) there are not measures to evaluate the performance achieved with the budget and if economy, efficiency and effectiveness principles have been followed; (e) managers do not have incentive to improve the quality of services as nobody measures the outcomes of the process.

This method has been used traditionally in many public organizations (including central governments, national health services, local governments, educational organizations) and in many countries, including the USA until the 1970s where annual increases averaging 5–10% were seen as confirming instrumentalism (Khan and Hildreth 2002). However, around 1970, this method was considered as inadequate and some other orientations have emerged since then. New concepts and approaches have been developed in practice. Some authors argue that the reasons for changes in budget theory were the environmental, institutional changes and legislative reforms, among others (Khan and Hildreth 2002).

### Zero-Based Budgeting

In contrast to incremental budgeting, this method of budgeting starts every year as it if were the first year of the organization. Each department must justify how much money it spends on each activity or program. Each year starts from scratch and

decisions and past budgets do not serve as a basis to calculate the level of current expenditure. However, analyzing all items of expenditure from scratch is a difficult task. Given its complexity, it is only applicable to particular aspects of the activity of an entity or programs that require special monitoring.

For the allocation of resources, it is considered that each function of a department proposes certain objectives that relate to some goal the department could achieve with the allocated financial resources. This technique provides a more targeted planning and can be applied together with a program budget or any other type of budget.

Zero-based budgeting tries to force managers to justify every activity of the departments; otherwise, the budget for their department is zero. That means that all expenditures that are not justified theoretically stop. Furthermore, it is necessary to evaluate the various proposals and the hierarchy between activities competing for the same resources.

The implementation of zero-based budgeting requires an annual review of the full budgeting process. All the activities that are being developed must be reviewed and alternative ways to provide the same services must be sought. This allows managers to identify and remove those that have proven to be inefficient. Martínez and García (2013) argue that zero-based budgeting can be a useful tool during fiscal crises helping to achieve the objectives at minimum cost and obtain financial sustainability and stability.

Some of the advantages of zero-based budgeting are (Pidgeon 2010): it allows the questioning of the inherited position and challenges the status quo, it focuses the budget closely on objectives and outcomes, it actively involves operational managers rather than handing them down a budget from above, it can be adapted to changes in circumstances and priorities, and can lead to better resource allocation. But it also has some disadvantages (Pidgeon 2010): it requires more time than incremental budgeting, professionals need skills and training with this type of budget, difficulties can arise for the decision about the activities to be carried out, difficulties to estimate resource requirements for new activities, and the identification of suitable performance measures may be difficult.

This budgeting technique began to be implemented in private companies in the 1960s and was introduced for the first time in a public administration in the Georgia State Budget in 1972 with great success (Martínez and García 2013). Later it was introduced into some US government departments, although the attempts to implement this budget system in countries like Canada and Mexico were failed. The high cost of implementation and the bureaucracy required, coupled with an environment of global economic growth, led many to give up this technique. However, with the financial crisis of recent years, interest in this budgeting technique has increased, because it is considered that it can help to better control the public deficit.

### Performance-Based Budgeting

Performance budgeting emphasizes the things that government does rather than the things it buys (Tyer and Willand 1997); it therefore changes the focus from the means of accomplishment to the accomplishment itself. The concept has been interpreted differently at different times and in different countries (Diamond 2003). This type of budgeting has undergone an evolution: originally it focused mainly on objectives and was also called budgeting by objectives. Nowadays, performance budgeting focuses on performance and results because of which some authors call it "new performance budgeting." Other names for the more actual version are output budgets and outcome budgets.

Performance budgeting shows the objectives and goals to be achieved with the use of public funds, the financial resources necessary for their implementation, and by obtaining quantitative data helps to measure the extent to which the objectives have been achieved.

The objectives were introduced into the budget in the 1940s in the USA for specific activities of certain municipalities and states. They were developed and implemented more widely by various European governments and the USA from the 1960s to the late 1980s. The main innovation

was the introduction of functional classification into the budget, classifying expenditure according to the purpose intended.

### Program Budgeting

Program budgeting can be considered a variant of performance budgeting. It is a budgetary philosophy which breaks with the traditional concept of incremental and line by line public budget.

It is based on the assignation of resources to the programs and activities that the organization carries out; it describes and gives the detailed costs of every activity or program that is to be carried out with a given budget. Program budgeting is made up of the sum of all activities and programs. This means that it is necessary to define the activities and programs and establish priorities among them. A program is a set of resources organized for an end. So, the budget delineates all the costs associated with doing something. Once the resources have been assigned to a program or activity, the output of the program can be decided. For example, it is necessary to describe the expected results of a proposed program.

In sum, the aim of a program budget is that the organization provides detailed information about the activities that will be carried out and their cost. So, this type of budget is sometimes mixed with other techniques. This is the case of the Central Government in Spain, where the budget identifies all the programs, although the data contained in it are estimated mainly through an incremental procedure. The true spirit of program budgeting involves the development of alternative programs to achieve the same goals but with different costs.

In the framework of program budgeting, the PPBS budgeting approach has acquired great relevance Kim (2006).

### Program Planning Budgeting System (PPBS)

PPBS is a technique that allows the integration of budgeting and planning through the programs. The budgetary process in this case has three basic phases (Diamond 2003): (a) the planning phase, where the objectives of the organization must be defined in order to evaluate the different possible ways of achieving these objectives; (b) the programming phase, which took the proposals of the planning phase and integrated them in the programs defined through a hierarchy of the objectives; and (c) the third phase is the translation of each multiyear program into a set of specific annual actions. The information about the execution and control of the annual budget offers usually conclusions or lessons that are useful for reviewing the plan in the medium and long terms. The PPBS can be a useful long-term planning tool as it informs not only about the short term but also about future implications of present decisions.

This type of budget was first adopted by the US Department of Defence in 1961 and by the UK Ministry of Defence in 1963. It was later applied by many other public administrations, such as states and local governments, both in the USA and in other countries (Diamond 2003). PPBS were embraced by the Netherlands in its Government Accounts Act of 1976 and by the Department of Education and Science in England. It was also used in France and Canada.

### Performance, Results, and Output-Based Budgeting

The Budget Committee of the Council of Europe (2005) defines results-based budgeting as a budget process in which (a) budget formulation is based on a set of objectives and expected results, (b) expected results justify the resource needs which are related to the outputs necessary to achieve these results and (c) actual performance is measured with related performance indicators.

Results-based budgeting has several designations depending on the country. For example, in the USA is referred to as performance-based budget, PBB, while in other countries output-based budget or outcome-based budget are more common.

The aim of this type of budget is to provide performance information that can be useful for management and evaluation processes. Its origins are linked to the New Public Management, where the focus is on performance management. The decision making is based on the ability of the programs to convert inputs to outputs and the outcomes of the process. So, budgetary authorizations are related to outputs and outcomes instead

of inputs, and the debate must be focused on these issues.

Within this philosophy, the following questions must be answered: What are the objectives of the department? What do we want to achieve with our activities? How will you achieve these goals? What are the costs of the activities? How will the effects of the activities be measured? As a consequence, the budget must contain information that permits the evaluation of whether the objectives have been achieved and if the results and costs are as expected.

One of the main strengths of results or performance budgeting is the introduction of performance reporting in the budgeting process, which has been recognized as an important advance. According to the OECD (2007), countries that have introduced it reported the following advantages for performance reporting: it focuses more keenly on results within the government; it provides more and better information on government goals and priorities, and on how different programs contribute to achieve these goals; it encourages a greater emphasis on planning and can provide signals to key actors about what is working and what is not; it improves transparency by providing more and better information to Parliaments and to the public, and it has the potential to improve the management of programs and efficiency.

To implement this type of budget, a cost accounting system is necessary to allows managers to know the cost of the services. Moving from a focus on inputs to one of outputs or outcomes requires some changes in the reporting systems, in order to generate the information that will be used for budgeting and management. Furthermore, it is necessary to develop a performance indicators system for evaluating the achievements and performance of services delivery.

The output focus has received some criticism. For example, it does not consider the impact of the programs on the society; politicians must be accountable not only in output terms but also in outcomes. Furthermore, although it may ensure that governments are getting more for less, they may obtain some outputs that make little contribution to solving policy problems (Rose 2003).

At the moment, there are few governments that have adopted results-based budgeting because it requires important changes in the administrative and budgetary procedures if the potential benefits of this type of budget are to be achieved; the programs and plans must be readapted to be useful for decision making. With the crisis and the cuts, interest in results budgeting has increased, as it is a tool that can help to improve financial management of governments. Performance measurement in the results budget can lead to a more effective and efficient management of resources. At the same time, citizens are demanding accountability and information about results and results budgeting offers performance reporting that can be very useful for performance evaluation.

According to the OECD (2007), the following factors must be considered for implementing performance or results budgeting:

- There is no one model of performance budgeting and each country needs to adapt its approach to the relevant political and institutional context.
- Performance measures should be integrated into the budget process.
- Designing government-wide systems that automatically link performance results to resource allocation should be avoided because these systems may distort incentives.
- Performance budgeting requires reliable output and outcome data that are continuously updated.
- It also requires political administrative support; one option is to develop incentives to motivate civil servants and politicians.

Some European countries, such as Denmark, the Netherlands, Sweden, and the UK, have already taken some initiatives towards implementing performance budgeting. In most of these countries, these initiatives are in the framework of introducing managing by results.

An example of a country that has adopted result-based budgeting is New Zealand. Initially the government focused mainly on outputs but little by little it moved towards an outcome-based-approach. Nevertheless, because of the difficulties

of definition, measurement, and management for outcomes, the progress towards this vision has been much slower than anticipated (Rose 2003). The evaluation of the reforms trying to move to an outcome focus is positive as it led to improvements in the information that has been added to the financial statements elaborated with accrual accounting. In any case, the reforms for introducing performance budget require a long time and implementation must be gradual.

### Participatory Budgeting

Participatory budgeting introduces an original way of managing public resources with the aim of engaging citizens in government. It is a democratic tool in which taxpayers participate in discussions and decisions about how to spend part of the public budget. It is also a means to increase the accountability and the responsibility of politicians. For this type of budgeting to work well, some training of citizens and groups that participate is convenient.

This type of budgeting is used mainly by local governments with the aim of using a more participatory approach in certain areas. According to Pidgeon (2010, p. 18), the potential advantages of this approach include: better decision making; greater understanding of budgetary processes; people will feel more involved in actions in which they have participated in the decision-making process; projects are more likely to be carried out; it is democratic, and transparently so; it leads to commitment to further development of PB; there will be less cynicism or apathy towards the local authority; and it will reach parts of the community otherwise excluded from decision making. Among the disadvantages of the process, we can include: the council may be seen as abrogating its responsibilities, participation may be low, decisions may be biased towards groups who can advance their view over that of the citizens in general, it is limited generally to second order budgets rather than core activity, it may be seen as undermining the council, it could be seen as bypassing the democratic process, and organizations which benefit from additional funding may not necessarily adhere to the same budgetary/financial disciplines and procedures as other public bodies.

Participatory budgeting has its origin in Brazil and has been used in recent years in the municipalities of many countries around the world: USA, the UK, France, Italy, and Spain, among others. For example, in New York, participatory budgeting has expanded since 2011 from four initial city Council Districts to 27 Council Districts at present. In these districts, residents vote toward proposals developed by the community to meet local needs (in 2014–2015, 51,000 New Yorkers voted to allocate $32 million dollars for locally developed capital projects across 24 Council Districts in New York City).

## The Budgetary Bases: Accrual Versus Cash Basis

The budget requires a criterion to be developed and different possibilities arise: cash, modified cash, modified accrual, or accrual can be applied.

The cash base budget includes the expenditures when cash is paid (regardless of when resources are consumed) and revenues when they are received (regardless of when they are earned). As it is focused on cash movements, it is said that it is mainly a short-term plan, which does not consider long-term implications. The modified cash basis is sometimes used for budgeting and means that budgetary revenues are recognized when cash is collected or when related receivables have a short-term maturity and expenditures are recognized when cash is paid or when related obligations have a short-term maturity. The budget, in this case, is a tool for control and to assure compliance with the limits of expenditure.

On the contrary, the accrual-based budgeting records amounts when the activity generates the revenue, increasing the liability or consuming the resources, regardless of when it is paid or received (General Accounting Office 2000). In this case, the budget follows the same criteria as the accounting statements, and the execution of the budget can be followed with the accrual financial statements. The main advantage is that decision making can be based on the cost of the activities, so planning considers the long-term impact of

investment and the applications of financial resources.

The cash basis has been widely accepted for several reasons: it is considered to adequately reflect the government's impact on the economy; it is linked to short-term vision; it is considered, in general, to provide adequate information and that it is useful to control spending limits; it is easy to trace the money; and it is consistent with the vision of financing departments according to the cash they need and with cash planning by governments.

There are some reasons for avoiding the accrual basis in budget according to Blöndal (2003, 2004): accrual budget is believed to put budget discipline at risk (if major capital projects, for example, could be voted on with only the commensurate depreciation expense being reported, there is a fear that this would increase expenditures for these projects); different purposes (a cash-based budget focuses on the traditional public sector control of legality); and the sheer complexity of accruals.

In most European countries, budgets are based on cash or modified cash methods. However, accrual is gaining ground over the cash basis in the accounting system. This means that there is a double system and the usefulness of financial accounting is not very clear. As the budget is the most important document for planning and management, all the debates focus on it and financial accounting is misused.

Nevertheless, in recent years, many European countries, including Finland or Sweden, have carried out some initiatives towards implementing accrual-based budgets. In these countries, the legislatures have a relatively weak role in the budget process (Blöndal 2003). These initiatives have usually been joined to performance reporting, where the focus is on outputs and outcomes. The use of accrual budgeting allows managers to have reporting about the cost and it is more convenient for performance measurement and control. Anglo-Saxon countries have also undertaken steps for the implementation of accrual budgeting, and it is used in the UK, Australia, and New Zealand. In the USA, there is increasing interest in accrual budgeting due to a desire to improve the recognition of long-term commitments in the budget and to link cost and performance information to the federal budget process more directly (GAO 2000).

Some of the advantages of the accrual budget are (Blöndal 2004): it provides cost information that can be useful for decision making, it will illuminate the long-term sustainability of public finances, it is a catalyst for other management reforms, and it provides a consistent base with accrual accounting.

Accrual budgeting is considered as a tool to improve public sector management that can help to manage financial sustainability of governments. Because of this, many international organizations recommend its application, but it is not an easy task. It is necessary to change budgetary legislatures and political procedures that are usually based on cash bases.

## Conclusions

Budgetary processes are essential in the public sector for implementing public policies and allow the estimation of revenues and expenditures. Budgets are the cornerstone for transparency and accountability in the public sector and permit the budgetary control in order to monitor the fulfillment of political decisions. They should also be a tool to measure and control the performance of governments.

The budgeting process is organized around four phases within the budget cycle: preparation and formulation, approbation, execution, and control and audit.

Budgeting techniques have evolved over time with different types of budgeting emerging in recent decades. Each of these has advantages and disadvantages and governments have used different combinations of them to succeed in the process.

Originally, budgets were mainly prepared following an incremental procedure but this technique has some disadvantages and has been criticized. On the contrary, zero-base budgeting starts each year with an evaluation of the activities and programs that are considered necessary. However, in both cases, the budget focuses how much the entity spends, not on the reasons and activities

it spends the money. Trying to overcome this problem, performance and program budgets organize the budget into programs, activities, and functions in order to focus on the objectives of the expenditures. One particular type is the program budgeting and program planning budgeting system. The main criticism applied to the above types of budgeting is that they mainly focus on inputs, so a new type of budgeting has emerged recently with the aim of focusing on results, which can vary depending on whether the interest is in the outputs or in the outcomes. This type of budgeting has its origin in the New Public Management Theory and has been recommended at international level under the general concept of performance budgeting. In order to implement performance measurement, it is important to define the objectives and the indicators that allow the evaluation of their fulfillment.

Performance budgeting is implemented at the moment in some European countries, mainly Nordic countries, with a focus on outputs and outcomes. However, it is not very extended in European continental countries, where the incremental budget is the most used procedure for the estimation of expenditures and revenues.

At the same time, some governments have introduced accrual-based budgets to bring them into line with accounting procedures, where the focus is the resources used. Accrual basis is considered to be more convenient when the aim is to introduce performance budget. Some experiences argue the positive benefits but the majority of countries continue using cash or modified cash basis for the budget.

## Definition

New Template:Budgeting is the keystone of the management control and accounting systems in almost all organizations, but despite its extensive use, it is far from perfect. Nowadays, when the control of available resources is vital for sustainability of any public or private entity, budgeting plays a strong role in controlling operations efficiently and effectively.

The budget has a central role in public sector management. Wildavsky (1975) argues that the budget is a vital element of any government because it reflects the action plan in the implementation of public policies. Researchers and practitioners have confirmed the loss of relevance of traditional approaches to budgeting. To overcome the criticism and weaknesses of traditional budgeting, it is clearly recognized that there is a need for alternative solutions of budgeting methods designed to adapt to the new environmental conditions, long-term planning focused on outputs, citizen orientation, or the effective achievement of objectives.

## Introduction

This chapter explores different techniques to budgeting in the context of more performance-oriented methods of management control required in conditions of uncertainty. Budgeting is considered to be one of the most important and useful technique used in management control systems, as it provides a mechanism for planning, organization, and control.

In the public sector, the budgeting process can be viewed as more problematic than in the private sector, since the objectives of public organizations are more difficult to measure. A private entity typically has maximization of profit as its central goal. In contrast, measurement of the outcomes of public expenditures can be a complex task since there is no profit or loss basis through which the performance of organizations can be evaluated.

The aim of this paper is to analytically evaluate the main techniques for preparing budgets – the incremental approach, performance based, activity based, zero based, and priority based. Each of these approaches is discussed in the light of its key strengths and weaknesses. We also found that they have been used in both public sector and private sector organizations, with varying levels of accomplishment.

The incremental approach is the most traditional budgeting method that uses previous year's figures adjusted to the management's assumptions and goals for the following year.

This technique, analyzed in the first section of this paper, is better suited for organizations whose operations are moderately stable. However, this method is being criticized because it does not reflect the strategy. Besides, it is also considered as a long and heavy process that leads to bad performance evaluation and promotes budget wastage.

In the next sections, alternative techniques to budgeting are summarized to provide guidelines and to make clearer the link between budgets,

outcomes, and performance. Conclusions are presented in the last section of the paper.

## Incremental-Based Budgeting (IBB)

Traditionally, most governments have decided to adopt the incremental budgeting approach. In this technique, the budget preparation for the following year is based on the approved budget for the current year plus an increased amount considering inflation.

Therefore, in incremental budgeting, the definition of the amount of resources to be allocated to the various public entities or departments is based on patterns of previous periods, including marginal additions. This involves using known factors such as new legislative requirements, service developments, and anticipated price inflation. So, it is relatively plain, and it is of most relevance in services where there is little year-on-year change in service activity.

This approach makes sense since the process is mainly concerned with the increment in operations or expenditure that will be incurred during the next budget period. In addition, a central feature of this approach is that budget preparation takes place through a process of discussion and compromise. It is, therefore, based on a fundamentally different view of decision-making compared to other approaches, which are more outcome oriented. The manner of negotiating between different interest groups depends fundamentally on the will to negotiate and compromise. Thus, this model presupposes the existence of a fairly stable and democratic form of society. The incremental process becomes invalid, if this consensus breaks down.

In brief, its key characteristics are therefore based on a prospect of decision-making focused on expenditures, discussion and compromise between interested parties to achieve a satisfactory budget, and a dependence on the current year budget to create the budget for the following year.

The system itself is moderately straightforward. As the next year's budget depends on the current one, time becomes a key factor. Since implementation specifically excludes the setting of objectives or outputs, there is an emphasis on inputs instead. However, some of the main advantages of incremental budgeting should be noted. It is easy to recognize that it is retrospective, makes marginal changes, and safeguards agreement through consensus and negotiation. Moreover, it is useful in the public sector because outputs are difficult to define and quantify. It allows concentration upon key areas of change, as far as policy makers are concerned. Consequently, the impact of change can be seen quickly, the budget remains stable, and change is gradual.

Indeed, this is the simplest and most traditional budgeting method, whose focus on incremental approach is the input control. It also promotes a system of budget execution control. However, as this technique is based on the budget approved for previous periods, it does not stimulate medium- and long-term planning or the effective achievement of objectives, regarding the use of available resources or their efficient allocation. It is reactive rather than proactive, and the support for increased expenditure is the increased cost of inputs.

The validation of the needs of subsequent periods does not take place, meaning that this kind of budget does not promote strategic solutions, maximization of value, opportunity and efficiency in resource control, and evaluation of results and performance. The decisions made and the priorities established in the past are more likely to remain unchanged in the future. It does not allow for an overall view of performance. Therefore, this approach may not incorporate a careful evaluation of the level of services being offered.

In turn, government unit managers often strive to spend the entire budget of that year, so there is no year-end surplus. This leads to maintain the current budgetary level and to help the unit manager apply additional funds. The inefficiency and wastage portrayed is in this sense often perpetuated and encouraged by incremental budgeting.

Some authors have presented the most cited weaknesses of traditional budgeting. Some of the major disadvantages identified in the Neely et al. (2001) study were the lengthy process, the high preparation costs, and mainly the lack of focus on

strategy. The study also highlights the fact that this budgeting model does not favor the increment of the organizations' value, given its strong focus on cost reduction and departmental barriers. Libby and Lindsay (2010) discussed similar results in their study. The authors report that the traditional budget does not consider strategy. Additionally, it is expensive and slow at detecting problems, becoming obsolete very quickly.

Incremental budgeting does, in fact, have a number of weaknesses as it assumes that existing budget patterns are relevant and satisfactory, meaning that activities and working methods will continue in the same way. There is no incentive for developing new ideas or incentives to reduce costs.

The main disadvantage of the incremental budgeting approach is that the majority of expenditure, which is associated with the base level of activity, remains unchanged. Therefore, past inefficiencies and present waste are perpetuated in the future.

## The Relevance Loss of Traditional Models: Time for Change?

### Performance-Based Budgeting (PBB)

The new budgeting approaches take place in this scenario of relevance loss of traditional models. The traditional approach to budgeting focuses on incremental changes in detailed categories of expenditures. This scenario leads us to new ways of budgeting, such as the performance-based budgeting (PBB). PBB focuses on results and changes in funding rather than on the base (the amount appropriated for the previous budget cycle).

In this PBB process, the entire planning and budgeting framework is result oriented. It reflects the practice of developing budgets based on the link between program funding levels and expected results from that program. Program administrators can use it to manage more cost-efficient and effective budgeting expenditures.

The major feature of PBB is accountability and not only the fulfillment of the law and previous funding decisions. It presents the purpose for which funds are allocated and sets measurable objectives. Moreover, it identifies programs that look for similar results, drawing the attention of legislators to such interrelationships.

Segal and Summers (2002) point out that PBB is an exercise that "costs out" various activities that are necessary to achieve a result. In their opinion, this technique comprises three components: the result (final income), the strategy (distinctive ways to achieve the final outcome), and the activity/outputs (what is actually done to achieve the final outcome).

For legislators, PBB is helpful to understand the background underlying the purposes of state-funded programs and the results they achieve. It explains previous legislative funding decisions and aids with estimating and justifying the potential consequences of new funding decisions.

In a study on US public administration, Kong (2005) evidences other advantages of the implementation of the PBB approach. The central question raised by the author was what is new about PBB when compared to conventional budgeting techniques (incremental line items)? The author identifies three key vectors in the conventional public budgeting structure: the allocation of resources, organizational management, and citizens. Incremental line-item budgets are mainly focused on the allocation of resources, including financial, human, and technical resources. The first versions of PBB were, according to the author, connected with organizational elements, including the definition of key objectives, political goals, and activities. Later versions, in the 1990s, focused on the outputs, service quality, and citizen's satisfaction.

With the aim of studying performance evaluation, Andrews and Hill (2003) developed a study on PBB technique, comparing it to the traditional approaches. They concluded that most American states have carried out reforms on PBB implementation, yet very few presented behavioral changes resulting from such reforms, both in terms of overall development and of response to new incentives based on performance or on resource allocation. The authors also explained that the PBB approach is applied simultaneously with traditional techniques, influencing the type of PBB

to be implemented, rather than complementing existing budgetary practices.

It can be concluded that the effectiveness of the PBB technique is enhanced when the old budgeting systems are totally replaced, as observed in the experiences carried out in the states of Florida and Virginia. These states included (Andrews and Hill 2003: 152) management accounting and auditing systems based on performance; adjustment of the existing budgeting systems to strategic changes, according to the specificities of the various bodies (tailoring model); introduction of responsibilities in required levels of performance; and behavioral uniformity in budget compliance, which should include simple rules, clarity, and seriousness in the announcement of performance expectations by budget managers.

Despite the many advantages of PBB, there are some challenges in the process, such as the confidence that performance information is valid and accurate, the dimension of state government coupled with the number of performance indicators available that can distract and overwhelm legislators when making crucial funding decisions, and the proper use of incentives and disincentives to improve performance.

Actually, PBB intends to improve the efficiency and effectiveness of public expenditure by linking the funding of public sector organizations to the results they deliver, making systematic use of performance data. However, PBB should not be seen as an isolated initiative. It should be viewed, rather, as part of a set of broader reforms, often referred to as managing for results, designed to help public management focus more on results and less on internal mechanisms.

### Activity-Based Budgeting (ABB)

Activity-based budgeting (ABB) also emphasizes outputs and value creation. ABB is the most common alternative technique to the traditional approach. This approach provides a high level of detail, when compared to other techniques.

The financial guidance of traditional budgets is, undoubtedly, problematic. In other words, they do not favor the understanding of financial data by operational managers. The idea is to create a new budgeting model that allows for greater flexibility in the organization while dealing with unexpected events, emphasizing, thus, the importance of operational planning (Hansen 2011).

ABB emphasizes communication and internal cooperation, since it focuses on activities rather than on responsibility centers, showing the imbalances, the useless activities, and other information that can be used to improve operations where resources are actually needed. Or, through a more simple definition, this approach intends to prepare budgets using overhead costs from activity-based costing (ABC) methodology.

The Chartered Institute of Management Accountants (CIMA 2013) describes ABB as a system of budgeting based on an activity framework, using cost driver data in the budget setting and variance feedback processes.

The initial formula of ABB uses cost drivers (identified through ABC) to help derive budgets. As previously mentioned, and as its name suggests, ABB focuses on activities rather than functions or responsibility centers.

According to that Institute, ABB follows three main stages:

1. Detecting activities and their cost drivers
2. Forecasting the number of units of cost driver for the required activity level
3. Calculating the cost driver rate (cost per unit of activity)

We can identify some of the advantages provided by ABB. Its strengths are similar to those of ABC, since ABB draws attention to overhead activities and their associated costs. It highlights that activity costs may be controllable if activity volume is controlled. If we can control the causes (drivers) of costs, then costs should be better managed and understood. Where traditional budgeting tends to put an emphasis on input costs, ABB takes an outputs-based approach, recognizing that activities drive costs. ABB analyzes business as a group of activities, a view point that

connects well with organizational strategy. ABB can also allow useful information in a total quality management (TQM) atmosphere, by relating the cost of an activity to the level of service provided.

Despite these strengths, there are some concerns or questions that could be considered when implementing ABB. It requires significant time to be implemented (as with ABC). In fact, a large amount of time and effort might be needed to link the key activities with their cost drivers.

Do we have the essential support? Do we have the required human and technical resources? Can we involve operational managers? Is it difficult to clearly identify individual responsibilities for activities? Like ABC, ABB is expensive to implement. Will the costs of application outweigh the benefits? It is arguable that in the short term, many overhead expenditures are not controllable, which might difficult the implementation of this approach. On the other hand, there are also expenditures that may not vary directly with the changes in the volume of activity, which does not benefit the task/procedure of cost-benefit analysis.

Even though this model is oriented toward continuous improvement, with an emphasis on the outputs, the ABB process is still a relatively new concept, and its practical advantages are yet unknown. Hansen et al. (2003) draw attention to the lack of scientific evidence to support its benefits and its pragmatic viability.

### Zero-Based Budgeting (ZBB) and Priority-Based Budgeting (PYBB)

The concept of zero-based budgeting (ZBB) emerged in the 1960s in the USA to overcome the criticism usually attached to the incremental budgeting. These terms were used for the first time by Peter Pyhrr who developed the process for Texas Instruments. Due to its success in the private sector, this model was also applied in the preparation of the 1973 budget by Governor Jimmy Carter in the state of Georgia.

This technique assumes that budgets can be recompiled from a zero base and focuses on programs and activities rather than departments or units. It aims to justify resource allocation in an individual budget scheme, regardless of prior period budgets. It is not based on historical data and begins each budget period afresh.

The budget is primarily allocated as zero, and the reasons for the financial resource allocation must be validated. This technique requires that the entire budget must be justified in detail and clarified why the organism should expend money in the proposed manner. This technique diverges from traditional budgeting techniques as it emphasizes the analysis of alternatives.

The process implies that each budget element is required to be treated as new before any financial resources are allocated to it. Moreover, any plan is justified in terms of the total cost included and total profits. In ZBB approach, the past performance is not referred to as a building block, i.e., new and old work tasks are handled equally. Each activity is correctly identified and then evaluated by analyzing alternative levels of operation for the same activity. These options are classified, and priorities are set for achieving efficiency and effectiveness in this process.

Under this framework, also Drury (2004) defined ZBB technique as an approach where all activities are justified before the decision on the amount of resources to be allocated to each activity. The focus is given to programs or activities instead of focusing on the functional departments (typical of traditional approaches).

The author claims that the ZBB approach assumes that the need to present the different expenses related to the activities in a ZBB ensures the allocation of all resources on a "cost-benefit" basis. Following this principle of allocation, organizations and governments will be one step closer to ensuring "value for money," questioning old assumptions and implementing a systematic analysis tool which might, for example, be able to declare the abandonment of unproductive contracts, projects, or programs. However, supported by the bottom-up strategy, the implementation of the ZBB technique implies the justification of all expenses, therefore introducing a certain economic rationality.

Finkler and Ward (1999) presented the four main objectives of the ZBB approach: (1) to

analyze the activities performed within the organization, (2) to understand the origin of those activities, (3) to study the most efficient and effective way to accomplish those tasks, and (4) to identify the vital activities of the organization and their cost. The authors also highlight the ZBB focus on budgeting expenditure, identifying another positive aspect of this technique – the special emphasis given to nonacceptance of long-standing government budget surpluses.

The study by Akten et al. (2009) presented a positive experience in the application of the ZBB technique. The authors identified a European telecommunications group which, in the implementation process, began to disaggregate their expenses into "logical decision units," considering new types of expenses, such as capital expenditures (e.g., building a third-generation network). Each decision unit of capital expenditure was classified into the following categories: (i) reviewing, (ii) maintaining, and (iii) cutting down capital expenditures. The authors discussed the financial priority of each capital expenditure and its alignment with the company's strategy. After a few interactions, the company reached the goal of reducing capital expenditures by about 20%.

Actually, ZBB provides distinctive benefits over traditional incremental budgeting. These can be summarized as follows:

- It is a systematic check of the base budget.
- The planning system needs procedures to examine every budgetary item as if it was new.
- It focuses attention on outputs in relation to value for money; it allocates financial resources based on results.
- It avoids incremental budgeting simply based on the previous year's figures with an increased amount of inflation.
- It enhances communication and management consensus and helps to develop a questioning attitude; inefficiencies and wastage can then be reduced.
- There is ultimately a better allocation of resources.
- It inspires managers to look for alternative operation plans in that it has the ability to be adapted to changing circumstances.
- It strengthens much of the thinking behind the current efficiency agenda.

Several articles were published in the 1970s about the ZBB technique, even though the number decreased rapidly in the early 1980s (Drury 2004). Currently, they are almost nonexistent. The gap between the years of successful research and present research has obscured the theory and the practice of ZBB technique, together with the political burden involved.

Wildavsky (1975) presented an unsuccessful case in the US Department of Agriculture. The reasons for failure were mainly the allocation of specialized human resources for the exhaustive and systematic task of identifying priority needs; the need to justify things from scratch, even though that was not possible with programs that could not be replaced or changed; and, finally, the nonacceptance, felt by the professionals, of the economic rationality logic, pressured by the constant monitoring of the tasks performed, even though they recognized the advantages of this technique.

Some academics have provided a few reasons for this lack of success: the powerful message that "the expenses have to be fully justified," excessive bureaucracy, high costs, professional awareness, and consequent long procedures (Drury 2004; Tayles et al. 2007; Worrall et al. 1998). Success will depend, according to Worrall et al. (1998), on the implementation of a solid strategic process.

## Why Does Zero-Based Budgeting Have Some Pragmatic Weaknesses? Is Priority-Based Budgeting a Long-Term Solution?

In fact, ZBB deserves acknowledgment, because it is a pace in the right direction and away from traditional budgeting. Nevertheless, ZBB has some pragmatic weakness.

- It is complex and sophisticated.
- It requires special skills and training.
- It is time-consuming.
- It is expensive, and there is a tendency toward excessive bureaucracy.
- There is a tendency for annual conflicts over budget allocation because a new budget allocation is started every year.
- There can be problems with performance measures and priority criteria.

Undoubtedly, in ZBB approach, the review procedure is time-consuming, long, and complicated. It requires broad analysis and reporting, sharing, and updating of information to ensure that everyone is in the same position. If the program is not totally understood or well done, ZBB can prove to be an insuperable objective.

Furthermore, ZBB depends on objectivity and solid leadership to honestly review programs. Additionally, it is hard to find an impartial budget reviewer and bureaucrats who do not have any interest in maintaining the fiscal status quo or challenge the government.

Indeed, the adoption of new techniques of accounting and management control is largely stimulated by the government. Lapsley and Wright (2004), after analyzing the Scottish health-care sector, concluded that the ZBB technique was the most used by these bodies: "The health care sector made particular use of budgeting techniques, with organisations using ZBB as well as one or other of management (RM) and activity-based management (ABM). In turn, its use in local authorities and government agencies was much lower, with over half of these organisations not using any of these techniques" (Lapsley and Wright 2004: 358).

According to this study, the National Health Service units are under high pressure to ensure any future savings and efficiencies. The adoption of the ZBB technique is advocated by the government to establish areas of cost savings. On the other hand, according to managers of health-care organizations, the ZBB technique is complex and time-consuming (3/4 months to be completed), with very low returns for the organization. Nevertheless, one of the main results of the interviews carried out in this study classified the ZBB technique as one of the most efficient techniques within the management accounting systems.

Despite the numerous advantages of this technique, ZBB also presents some fatal flaws. Nevertheless, priority-based budgeting (PYBB), which is a technical extension of ZBB, may be used to support/minimize some of those flaws.

The main objectives of the PYBB model are to emphasize corporate priorities in line with budget increasing. According to the Chartered Institute for Public Finance and Accounting (CIPFA 2006), its mode of operation is based on the review of current departmental services, and its evaluation requires the definition of some parameters: purpose of the services and standards for the provision of services and operating alternatives for such services. It is based on the analysis of these parameters that the items of expenditure for each unit of revenue will be ranked, which is a beneficial and highly expected factor for management decision makers.

PYBB allows a new vision that produces powerful concepts. It provides a system to expend within limited resources by uninterruptedly focusing on the outcomes most important for communities and on the programs that influence those results to the uppermost scale. It is a way to compare community values with the government programs and services. Thus, PYBB facilitates the determination of key community objectives and the evaluation of the impacts of these goals on programs and services. Moreover, it promotes participation in strategic decision-making regarding funding.

The method draws upon a systematic review of existing services, the reasons of its existence, the value they offer to citizens, and how they benefit the community. In parallel, the concern about the costs of each service and citizen expectations also assumes a key role. PYBB assumes that the guidelines can change and obstacles can be moved if it is necessary to maximize results for citizens.

Indeed, this technique of budgeting contributes to the long-term financial sustainability by

encouraging explicit options. These options help to develop a strategic budget that reflects the community values and ensures a high level of service to citizens. Furthermore, while ZBB usually uses the existing agency structure, the "silo" method, PYBB excludes silos and concentrates its attention on the state's core functions of government. It motivates governors and legislators to ask for strategic questions at the start of each legislative session like "What should the performance of the government be?" or "What is the best procedure for the government to measure progress and success?"

In determining the government's core functions, the essential services for citizens must be designed in order of priority (first question). After passing this step, it should outline quantifiable results to be achieved, as well as benchmarks to measure progress toward those outcomes within a given time period.

To answer the second question, performance indicators are a central instrument to make accountability possible. At least, the government should have one performance measure for each major activity and, optionally, intermediate measures.

Once these procedures are defined, programs and activities can be prioritized based on how they will really help achieve the government's objectives.

## A Priority-Based Budgeting Empirical Example

Worrall et al. (1998) demonstrated that the laws of a local government in the UK favored, among other aspects, the implementation of strategic priorities. The authors relate strategy-based budgets with the PYBB technique. In their study, it was concluded that 60% of the analyzed councils had submitted a strategic plan, although there was no consensus on the definition of "strategic management." The authors classified "strategy" as the management of a set of activities that will meet priority objectives based on values of equality and local democracy in detriment of more "sophisticated" purposes which were less adjusted to the real needs of organizations. As resources become scarcer, local political forces tend to focus more on their priorities. In fact, there is strong evidence that, although there are still many bodies acting according to the paradigms of the 1970s, most of the governments are rethinking the process of strategic definitions to achieve a mutual consensus on the effectiveness of the achieved results.

In order to provide a synthesis of the main strengths and weaknesses of the different budgeting approaches analyzed in the present study, we have prepared Table 1, which can be seen below.

**Budgeting Techniques: Incremental Based, Performance Based, Activity Based, Zero Based, and Priority Based, Table 1** A comparison of different budget techniques

| Budget technique | Strengths | Weaknesses |
|---|---|---|
| *Incremental budgeting* | Simplicity, inexpensive | Lack of strategy link; focus on margins; the cuts are arbitrary; delays in procedures |
| *Performance-based budgeting* | Focused on outputs, quality of service, and citizen's satisfaction | Few changes in behavior |
| *Activity-based budgeting* | Emphasis on outputs and value creation, reduction of bureaucracy; focus on activities and on the operational plan | Reduced practical implementation; little knowledge of its real advantages |
| *Zero-based budgeting* | Resources needed in a "cost-benefit" basis; focus on programs and activities; economic rationality | Complexity in implementation, high costs, excessive bureaucracy, procedural delays |
| *Priority-based budgeting* | Budget connected with strategy; global and participatory perspective | Laborious, difficult to implement |

## Conclusion

Budgeting is a key factor of management control systems. Nowadays, it is clear that these information systems are totally dependent upon the success of the organizations' priorities and strategic goals, whether public or private. This interface has reflected the need to integrate new budgeting techniques due to the inadequacy of traditional approaches.

For many years, the incremental approach was sufficient, because public spending was fairly stable and the revenues reflected economic growth. The revolution in the economic environment and the imbalance in current government accounts led to advancements in budgeting. Drawing on the traditional incremental-based budgeting approach more up-to-date techniques were created to prepare budgets, such as performance-based budgeting (PBB), activity-based budgeting (ABB), zero-based budgeting (ZBB), and priority-based budgeting (PYBB).

These alternative budgetary techniques received support and increased in popularity as they proposed keys to traditional budgeting's recognized difficulties. Moreover, these approaches can also be used as vital tools for the activity management control and interactive implementation of strategy and outcome analysis. For example, the implementation of the PYBB technique in a local government in the UK was intended to promote strategic management, such as a set of activities that will meet priority objectives based on values of equality and local democracy.

In fact, these new attitudes and concepts of budgeting seem to be more appropriate to face the current institutional challenges. Nevertheless, these new budgeting techniques are still scarcely disseminated.

## Synonyms

Bureaucratic reform; Changes to formal institutions of government; Civil service reform; Informal rules of civil services; Skills development and training; System of government reform

## Definition

Building civil service systems with career-structured elements; a capacity system that provides ranks, steps, and remuneration system components along with managerial and supervisory mechanisms for Yemen; building merit-based career systems with professional qualifications of knowledge, skills, and performance capacities; building a professional merit system of organization or machinery of governance and public administration in Yemen.

## Introduction

A civil service system was created to manage a bureaucracy in which individuals are selected for employment in the government on the basis of either competitive examinations or special qualifications, such as professional training. In the case of Yemen, it is not recommended to abandon the informal behavioral and management aspects within the Yemeni civil service system which offered, by the social structure and its effect on state power, control of society, the behavior and attitudes of the civil servants, and thus on any transition initiative within the public sector. By analyzing and understanding the impact of the informal system on both political and administrative aspects of the Yemeni state, and seeing how these formal and informal structures of power interact, that can help the donors more to precisely formulate, design, and implement sound aid policies and programs for promoting the capacity of the civil service system. In addition, the social structure that is mainly based on informal norms, values, and institutions affects the functions of the civil servants in Yemen, which in turn explains why Yemeni managers and organizations do not function in line with donors' expectations (see "Foreign Aid Policies").

## The Social Structure and the Civil Service System in Yemen

The power of Yemen's formal state institutions and organizations is far less than it appears on paper and is broadly subservient to the interests of informal institutions and organizations. The influence of the latter is reflected in the government's style of decision-making, in organization, management, interpersonal relations, and so on. Policymakers have to ensure that reforms are coherent with the existing social structures of society (De Soysa and Jütting (2007). The first question is thus: *What is the social structure of Yemen?*

According to North (1991), social structure is how social institutions such as clans, tribes, families, and educational, religious, economic, and political institutions organize a given society. In Yemen, Gabilih (tribes) are a key element in the social, political, economic, administrative, and cultural structure of society, as they constitute 85% of the population (Al-Thahery 2004). It is estimated that there are more than 200 big tribes in Yemen. The majority – 141 tribes – lives in the northern mountainous regions. The other 59 tribes inhabit the west coast and the southern and eastern regions. Yemeni tribes are social-economic

organizations that are significantly independent (Al-Dawsari 2012), with their own lands, water sources, boundaries, and markets. The tribes share a form of common law (‘Urf or Hukm ‘urfi), leadership (especially sheikhs), a sense of identity for members, and a code of ethical behavior (Gabyalah). Dresch (1989) stated that among the numerous definitions of tribes or tribalism, there are seven main characteristics worth listing:

- Solidarity: they share the same functions in terms of their role in promoting the welfare of their members
- Kinship: the tribes’ members feel, regardless of whether it is reality or not, that they have the same descent
- Culture and traditions: the tribesmen have the same culture, customs, and traditions
- Specific territory: each tribe often lives in a specific land
- Specific social, political, economic, and military organizations for each tribe
- The mechanics of “Asabiyya” (group solidarity) among their members and their fluidity
- Their ability to change and adapt to economic and political situations through alliances and feuds (see “Traditional Social Structure”)

Sheikhs of the tribes have various degrees of power, influence, and wealth and are usually “chiefs” who have authority over their “followers or individuals.” Generally, the sheikhs in the northern mountainous regions have more power than the sheikhs in plains and coastal areas, by virtue of their more isolated location. Based on origin, there are three major tribal gatherings in Yemen: Hashid tribes mainly inhabiting the mountainous regions; Bakeel tribes, partly in the mountains but the majority inhabiting the desert areas in eastern Yemen; and Madhaj tribes, inhabiting the coastal and southern and western areas (Dresch 1989).

The process of sticking to tribal norms and customs is still the key factor contributing to the power of the sheikh and the tribe in general. Therefore, the tribesmen are always ready to fight at any time and die for their sheikh and tribe, regardless of the personality, tribe, or entity they face. The more the sheikh is dedicated to tribal norms and traditions, the more tribesmen obey tribal customs and norms. If a tribesman disrespects the regulations, he will be disparaged, blamed, scolded, or even abandoned if the violations are major ones.

A tribal sheikh’s power also lies in the fact that he is supposed to be the most sophisticated and cunning in the tribe and the most aware of a tribe’s own traditions and customs. He is the owner of a large part of a tribe’s wealth and lands, and in most cases, he is the client of the political ruling elite. Even today, the authority of a sheikh takes precedence over state authority among tribesmen. He has the power to resolve the conflicts that occur between members of the tribe and to implement his demands on the members of his tribe, even by force. He is the protector of rights and justice through tribal customs, rules, and penalty systems (Al-Theeb 2006).

Yemen’s social structure does not only consist of tribes. There are several other social groups and classes, which have different social, political, economic, educational, and administrative characteristics. These are shown in Table 1:

The Sadah class (the descendants of the prophet PBUH) claims that their roots go back to the Prophet Mohammed; hence, they consider themselves blessed and distinguished from the public. They form 95% educated members an elite group from whom the imams (kings) were chosen. Together with the Qadhis (the judges) as the educated class, the Sadah occupied functions such as judges, religious teachers, and government officials of the imamate. Both Sadah and Qadhis formed the Yemeni *polyarchy system*. However, they do not derive their legitimacy from affiliation with any particular tribe. They arrived in Yemen only after the beginning of Islam, mediating between local tribes. They derive their legitimacy from a religious faith, as according to Islam, Muslims should respect and obey the Prophet Mohammed’s families. Muzayyinah (barbers, butchers, etc.) consists of “Akhadam” and “Abids” (the servants usually with black skin) representing about 4% of the total Yemeni population. Both have African roots and are the lowest members of the Yemeni

**Building a Civil Service System for Yemen, Table 1** Different Yemeni social groups and their characteristics

society. They have historically worked as butchers, barbers, innkeepers, wedding entertainers, and Ham'mam (public bath) operators. Their women have always worked in these urban occupations. The majority is landless, unable to defend itself by arms and dependent on tribesmen for protection.

The accommodation of social groups within the civil service system can be divided into three levels. The first level is the senior civil servants, ranking from director general to vice minister and minister. It represents the bureaucratic elites and is predominantly composed of the Sadah and Qadhi social groups. The second level is the middle management civil servants who occupy the positions of managers and heads of departments and branches. These account for more than 15% of the total number of civil servants. Although many have tribal descents, they are appointed by the top levels to guarantee the support in ruling the country, so they can be considered to belong to the strong men in the society. In turn, the mid-level leaders appoint lower-level personnel who are loyal to them. This third level are administrative personnel, specialists, technicians, and soldiers and represent the broad segment of society, accounting for up to 80% of the total number of civil servants in Yemen.

Generally, two ties of recruitment can be distinguished, namely, primordial and competing ties. In Yemen, primordial ties such as family/kinship, tribal associations, friendships, and regional and religious affiliation are dominant. But at all levels, some civil servants have been accommodated in office by competing ties such as a political party, private sector organization, and NGO or professional organizations. The concentric circles in Fig. 1 are a simplified visual representation of the complex interactions within the Yemeni civil service system. The values and norms influence the behavior and expectations of leaders and their followers as well as managers and their subordinates, as we will explore in the next section. In the tribal-political parties that rule Yemen, the members from the most powerful tribes are the key players who dictate the rules of the game within the party and the party's relations with the state, public sector, and civil service.

**Building a Civil Service System for Yemen, Fig. 1** Civil Service System and the Informal Ties within the Yemeni Society

With the democratic transition that took place in 1990, the sheikhs adapted to maintain their primordial power and gained new positions in the state and society. Some of them went to the top of trade unions and NGOs, and others formed political parties such as the Republican Party, led by Sheikh Mohammed Abu Lahoom; the National League for Democracy Party of Yemen, led by Sheikh Awad Alpatrh; and the Arab Ba'ath Party led by Sheikh Abdel Wahab Mahmoud. Sheikh Abdullah Bin Hussein Al-Ahmar and a number of sheikhs within the Muslim Brotherhood formed the Islah Islamist Party. The sheikhs held the senior leadership of the General People's Congress Party, which ruled for almost 20 years. Sheikhs hold almost 90% of the parliament seats and the government and military positions, and some are owners of the largest economic institutions (Al-Theeb 2006; Elayah 2014).

In terms of ideology ties, religious organizations in Yemen are still largely decentralized with small local actors managing mosques, schools, or Islamic courts. These informal organizations are mostly linked with the Islah Islamist Party and seem able to combine religious and tribal traditions. Bonnefoy and Poirier (2009) stated that the capacity of religious actors to link up with political organizations might explain the persistence and dynamism of the traditional/tribal civil society in contemporary Yemen. Much like the tribal system, religious organizations offer an alternative form of power (or "counterpower"), such as welfare, education, or Islamic justice, which are financed through endowments and religious endowments. There are many studies about Yemen that deal with the tribal politics phenomenon and how the tribal social structure forms the political life of the country. However, little attention has been paid to leadership and organizational practices. In the following section, the researchers attempt to redress the balance by presenting some of the informal organizational and managerial practices in the country (see "Organizational Leadership and Behavior").

## The Functions of the Civil Servants in Yemen

The function of the civil servants in Yemen features six important behavioral aspects, which are discussed in turn below: (1) the top man syndrome, (2) the decision-making process, (3) conflict management, (4) interpersonal style, (5) attitudes toward time and managerial behavior, and (6) attitudes toward women in management. There are many other aspects that could be considered, but these are the most important in terms of capacity building within the public sector.

In Yemen, the "top man" is the owner of public organizations and the prime agent of influence and control within his own organization. He sees himself as the head of a tribe, not as a formal organization that has formal rules and regulations. Thus the top man is the ultimate decision-maker, manager, planner, organizer, controller, and director.

*Top Man Syndrome:* there are four main features of this "top man syndrome." Firstly, the organizations' employees trust the interference of the top man, and his actions are crucial to solve many problems. Secondly, there is a feeling among outsiders – clients and suppliers to the public organizations – that "only the top man of an organization can get things done." Thirdly, the top man is overly busy and so not able to manage effectively (Muna 1980: 32). He is obliged to attend social events, conventions, and various other ceremonies. He accepts his role as a formal representative of his organization. He sees himself as the head of "a family," irrespective of the size or type of the organization, and often describes himself as "father" or, in the case of a younger top man, the "sheikh's brother" (Scott-Jackson 2009: 5). For example, as there is a strong societal norm of hospitality, the top man is overburdened with social visits to his office every day. Close friends, family and tribe members, government, and the top man's organization's officials all come by for nonbusiness-related chats. Formally, the main responsibility of the top man is to behave strategically as an agent of change in his organization, but instead, he is a social worker and an agent of his tribesmen, family members, friends, and so on. Fourthly, a leader's high expectations for success are also part of the top man syndrome. "Some Arabs recognize success as what one does for one's family rather than individual earnings or achievement" Al-Assad (2013).

The top man requires a strong commitment of all individuals to their tribes, hence facilitating and encouraging nepotism. The top man wants to gain the loyalty of members of his tribe and/or other important tribes and thus may select employees who would more likely strengthen his position among tribesmen and in his organization. This pleases the members who then declare their loyalty to him. The top man has to accept this strong sociocultural value to hire relatives and other trusted people. Nepotism in Yemen is practiced along different family lines. For example, Sadahs can always be recognized from their surname. As they assert that they are a noble social faction, they usually choose a fellow Sadah to take a job, thereby monopolizing the senior public jobs. Regionalism also plays a big role in practicing wasta (favoritism) and nepotism. When a top man in any administrative level recognizes that a person originates from a city or village that is close to his own, he begins building trust connections before starting the business relationship. Once trust is established, business is practiced on an informal level with high-valued social commitments. Thus the top man in a Yemeni organization has the ability and the capacity to employ influence and sustain control over the actions of actors in his organization, which is one of the common explanations of the power concept in public administration theory.

*Decision-Making Process:* the researchers turn to consider decision-making and how the top man uses his power in the decision-making process. Scholars and researchers in different disciplines of social sciences generally belong to one of two schools: one that asserts that decision-making is the distinctive managerial activity (Boussif 2010) and the other that states that the decision-making process is simply an integral part of the management process within each organization and at every level (Ali 1993). From scholars of organizational behavior, there is plenty of literature on leadership and leadership styles, often incorporating and/or discussing the decision-making process. One feature of this extremely multifaceted phenomenon is the leader's choice about how much and in what ways to include subordinates in decision-making processes.

In Yemen, subordinates usually respect and obey the decisions taken by the top men as these decisions are taken in consultation with subordinates and heads of units. This "custom" applies not only to the level of administrative organizations but also at the higher levels of family, clan, tribe, or nation. In most cases, neither the sheikh of a tribe nor a leader of an organization adopts a collective process of decision-making, but it has a somewhat autocratic style, where decision-making becomes highly centralized. Consultation is nevertheless an activity that is commonly applied and not just to ensure the decision is correct and based on good data, but because people expect to be consulted. The procedure helps to

avoid conflicts and allows for a "face-saving" mechanism. It is believed that consultation did include actual participation, rather than the somewhat passive consultation reported by others.

One can argue that the consultation process used by Yemeni administrative leaders is a human relations technique. It is used for several occasions and situations: to please, to placate, and to win over people who might be potential obstacles to one's ideas or actions. Even when decision-making takes place in a consultative setting, informality is not absent. Consultation is usually carried out on a person-to-person basis, while group meetings are strongly avoided. The communication channels, especially from the lowest level to the highest level, are important for effective decision-making processes. Top men generally do not occupy themselves with the communication system within their institution and between the lower levels. Managerial behavior is dominated by the need to take quick decisions that interfere with the monitoring process.

*Conflict Management:* Scott-Jackson (2009) argues that administrative leaders in tribal countries are: "concerned with non-verbal cues for conflict, third parties (mediators), procrastination. Consultation is normally used to reduce the chances of conflict in the first place" (2009: 11). Yemeni administrative organizations generally do not stray far from the tribal norms and customs of conflict management. Their conflict management system deals with conflicts at an early stage, when they are not yet aggressive. Yet they also have conflict management mechanisms in place to resolve conflicts if they become violent. This system relies heavily on arbitration methods as well as negotiation and mediation. If leaders or administrators sense a conflict brewing, they rush in to contain it before it escalates. They reconcile parties in the conflict to negotiate and settle their differences. Top men that each party authorizes as their representative usually facilitate negotiation (Al-Dawsari 2012).

As most tribal conflicts relate to personal interests and not the collective or organizational affairs of the tribes, personal issues are often a harbinger of conflict occurrence within public organizations. Most leaders and employees deal with organizational conflicts in a delicate manner. The top man always receives respect due to his position and power or the norms of society. His subordinates do not oppose him for fear of losing their jobs. In general, experience in Yemeni organizations shows that there is relatively little opposition and resistance from top-level managers to their leaders. Top men use many tactics to deal with top-level managers where there is "constructive" resistance, such as the aforementioned consultation approach, or by sending the general managers for training abroad, so they can earn US dollars to improve their lives. There is no mechanism to pacify for the moment till the next issue arises. A penal system is hardly used in the Yemeni civil service system, going from one issue to the other.

In addition to the power tactics described above, Yemeni top men use other behavioral tactics for conflict management, such as uttering "Insha'Allah" (If God will) as a face-saving and promising mechanism (just promising and keep promising). This mechanism is also inherited from collective norms, customs, and system values. In Yemen, face-saving processes are about honor and dignity. "Losing your face" means losing your tribal and social respect. Such symbolic meanings are illustrated in daily conversation. It is difficult for a Yemeni to say no because this may cause loss of face. Therefore, to avoid this insult, and to shift ownership of the matter beyond oneself, it is common to say "Insha'Allah." The use of the word "Insha'Allah" is a mere tactic to delay the work, or to discard made promises, in order to save one's reputation and to avoid direct confrontation. "Insha'Allah" can also be used as a vague signal of confirmation and agreement or rejection. Hence, it can mean yes, no, or maybe, depending on the context and the way it is articulated, but more often than not it just means "no" (Patai 2007).

*Interpersonal Style:* interpersonal communication is the process by which individuals exchange information and feelings through spoken messages and non-spoken messages, such as facial expressions. The typical feature of the interpersonal style in Yemeni organizations is the personal or person-oriented approach. Everybody will act

based upon their personal framework of reference and not on a general corporate or other mutually agreed framework. Because of the heavy emphasis on the personal approach, there is an "informality" in communications, both in the structure of the organization and in dealing with others. The first aspect of the interpersonal style in communication within Yemeni organizations is al wasta (connection) as a main tactic of socializing and association. The term wasta can be described as a "process of mediation": employing a go-between or intermediary. Wasta is a measure of influence through interconnected social networks based on kinship but extended to trusted individuals in the wider society.

Al wasta has transferred to Yemen's public sector and seems part of the clientelist phenomena in the administrative field. This clientelistic/administrative approach goes against reliance on official, institutional, or formal working channels and is an important means of running state affairs. The use of personal ties and connection (Wasata in Arabic) have become an ill in the Yemeni society. A person cannot do any type of business including fast-tracking, paperwork or taking any permits, obtaining referral or employment and resolving conflict without having connection or personal relationship with someone either in the government or any well know tribes. These informal ties lead to entrenched patron-client networks that limit the function of the Yemeni government. The use of personal (family and friendship) ties reflects both the strength of these ties and the weakness of institutional systems and procedures. Scott-Jackson (2009) questioned how core functions of government have been transformed into "personal fiefdoms." A transparent recruitment and promotion system is lacking, and personal relations are more important than formal knowledge and skills. In fact, one of Yemen government's greatest strengths is attracting the wrong people.

Time and effort will be minimized if the leader uses his personal ties and connections instead of the formal channels. Of course, this sort of activity only increases the inefficiency of formal systems. The researchers regard the wasta approach as nepotism and cronyism. They recognize, however, Scott-Jackson's caveat that: "simplistic criticism of this age-old and well-tried system, fails to distinguish between its more negative effects (e.g. promoting someone unfairly despite unsuitability) and its many benefits in building trust through strong social networks. Strong 'Wasta' is perhaps a competence in itself" (Scott-Jackson 2009: 6).

The second aspect of the interpersonal style is the *open-door policy* or tradition. This is another deep-rooted tribal tradition that has found its way into today's organizations. In tribal customs, the door of the sheikh should be open for the tribesmen and outsiders; otherwise, he is not regarded as a real sheikh. In the village, the sheikh's home, especially his Diwan (a meeting room for chewing Qat or a visiting room), is the place for receiving outsiders. The sheikh who maintains an open-door policy will receive great respect from his fellow tribesmen. An open-door policy promotes the standing and reputation of both the sheikh and the tribe, which consequently raises the status of the individuals and families belonging to this tribe. If someone has a problem that the government does not solve, they look for a powerful sheikh from a strong tribe to solve the problem.

These characteristics relate to the top man syndrome as he faces pressures from both formal and informal organizations (his tribe). The top man cannot compartmentalize his work life, his social life, and his personal life: they are often one and the same. The leaders ought to keep their door open because they feel compelled to accept the pressure in order to remain successful. They lead the organization by generating social acceptance inside. It is interesting to observe how often Yemeni administrative leaders bypass their subordinates by issuing instructions to employees at the middle or lower levels. The disadvantage of this is related to dysfunctional communication. Communication can become distorted when going up and down the hierarchical levels.

Employees are not accustomed to organization charts and job descriptions. Though written rules and procedures often exist, they are not used in reality. Most employees view their organization as a tribe; they ought to worship their leaders as long as they are in power. A similar construction is not

presented in the West. For example, Dorfman and House (2004) argue that the Dutch place emphasis on egalitarianism and are skeptical about the value of leadership. Terms like leader and manager carry a stigma. If a father is employed as a manager, Dutch children will not admit it to their schoolmates.

It is worth noting that in Yemen, management styles vary between Yemeni regions and subcultures. Therefore, managers adapt different styles depending on the situation and context. The managers that come from the strong tribal areas such as the northern areas of Yemen give priority to personal considerations over organizational goals and performance. It is part of their strong tribal values, which are part of their entire identity. Managers who come from the southern and western areas seem to be less prone to a personalized style of management as the tribal values are weaker in these areas. However, in general, top men in Yemeni organizations demand complete submission from their employees who, in return, do not take initiative and expect to be ordered around. As a means to control uncertain situations, most Yemeni managers adopt a highly personalized management style and assert their reliance on rules and regulations to avoid unpredictable situations. They assign duties according to their personal judgment, calling on rules and procedures that are generally neglected as a protective tactic to reinforce their power. Sabri (2011) believes that Yemeni managers are more prone to follow the trend of the day than to educate and lead.

*Time and Managerial Behavior:* in Yemen's civil service as in most other Arab tribal countries, the management of time is as much a management of social relations problem as it is proper utilization of one's working hours (Muna 1980). Most Yemenis spend a majority of their work time out of the office nourishing their socials networks, and it is very common to see people chatting over a cup of tea, chewing Qat, visiting the sick, or paying condolences during working hours. Many competing factors prevent the effective management of time in Yemen's civil service. As it is mentioned above, tribal and social norms of hospitality and reverence to others prevent a top man taking actions that save time. The civil servant has a double role in the community-tribe and the organization and has to succumb to heavy commitments to the extended family tribesmen, friends, and employees. Because of traditional parental behavior in management, it is unethical to tell an unexpected guest or visitor: "Sorry, I have an appointment or urgent work." Similarly, it is difficult for the top man to shorten a guest's visit even though the workload justifies doing so (Muna 1980). Senior government leaders fear relying on their subordinates. Therefore, they take up all sorts of activities and tasks that they should not, such as writing letters, inspecting the transportation system, and answering the phone. Indeed, a lot of time is wasted at all administrative levels. Time management in Yemen implies adherence to a concept of time that is not convenient for foreigners working in the country. For example, when scheduling or planning work activities according to specific timetables, Yemenis calculate double or three times the time needed. If an appointment is scheduled at a certain agreed time, it is not unusual to wait almost 3 h before something happens. The deadline is a flexible time frame. Prepared project plans are supposed to be implemented in accordance with time schedules and strategies, but these time frameworks are normally on paper, which is not suitable for a culture that accomplishes targets through the means of personal moods and appreciation.

Only when deadlines approach the Yemeni civil servants do begin the process of decision-making. Foreigners who deal with the civil servants are very strict in deadlines and will ask for reasons for the delay of the work or in obtaining approvals. This creates conflicts between donors and their Yemeni counterparts, which has a knock-on effect on networking between these actors. Yet the planning ahead strategies used in the West would probably not work in Yemen because society itself lacks the necessary social conditions. One has to be flexible by working with different scenarios and adapting to the flow of local life in order to deal with Yemenis. The nice aspect of the flexibility of Yemen society is that whenever something is not working you will find unexpected support on the spot. Yemenis are good

at firefighting, the practice of dealing with problems as they arise. Consequently, they are able to finish things at the last moment. That is their way of interpreting "just in time" management.

*Women in Management:* tribal and traditional cultural attitudes, patriarchal structures, and Islamic fundamentalism prevail in society, allocating women a low status in the family and community and a limited participation in society (Al-Bnan 2010). Women are subjected to various forms of violence and discrimination, including domestic abuse, deprivation of education, early or forced marriage, restrictions on the freedom of movement, exclusion from decision-making roles, denial of inheritance, deprivation of health services, and practicing female genital mutilation (Cooke 2008).

There is discrimination toward women in public or private offices. "Tribal honor" plays its role in this. Tribal sheikhs want to increase and enforce tribal culture among their communities. Therefore, they do their best to avoid any effective attempts by the state or international organizations to change the paternal attitude toward women and their lack of representation in civil service. The majority of women in tribal areas are not allowed to work in the government. Women in these regions do not hold positions outside of the home, because it is against the "tribal honor" (Al-Shara'af) for women to go outside a home alone. The majority of girls are educated until grade six, and after that, they are relied upon for household chores (see the indicators relating to the education sector in Table 1). Cooke (2008) describes how an absence of citizenship rights for women in Yemen is combined with crushing poverty, creating a society in which women are the property of men, unable to leave the house without the permission of a male relative and vulnerable to arbitrary arrest on the street even when they have permission to be there. They are also likely to be illiterate, to be married before they reach puberty, and to die during childbirth.

Women who are employed are often subject to harassment by male colleagues, especially in male-dominated environments. Social norms, combined with limited education and work-related opportunity, keep women far away from obtaining the required skills and resources to compete successfully with men for leadership positions. Women make up about 50% of Yemeni citizens at an age of potential employment (between 18 and 50 years), but form only 23% of the workforce. This means that most women are not participating in the country's development. About 72.1% of women are economically inactive (Al-Haj 2012).

Only women from Sadah and Qadhi families have leadership positions in the government. Like the top men, these "top women" see themselves as the prime agent of influence and control within their own organization. Both top man and top woman are quite aware of the importance of the concept and practice of power according to the inherited customs in the Yemeni society.

## Reflection for Donor Policies and Experts

Experienced donor organizations and experts often remark that working in Yemen is so much more complicated, and local involvement of Yemeni top and middle management is harder to reach than in any other country. For the last 20 years, the World Bank and IMF – with other donors following suit – have tried to reform the Yemeni civil service systems into a Western transparent and accountable model. The programs have been negotiated with top men and women. What the researchers witnessed is that they express their willingness to lead the proposed reform programs as long as their own positions of power, class, or tribe are not directly affected. For that reason, most of the reform programs so far have not been directed to restructuring the higher management levels, but have focused on skills training for the middle- and lower-level provision of computers and upgrading of physical infrastructure and cars. Practice shows that before the higher echelons commit themselves most programs run out of time and encouraged by the new trend in development cooperation where the recipient partner formulates the requests for a new development assistance more or less the same programs are submitted to donors for funding. In all these years, the population of

Yemen has hardly seen an improvement of the services of the public administration. They are still dependent on the informal network up to the highest level.

One of the main problems noticed here is that the top men and women will not place their future in the hands of a company whose experts they do not on forehand trust and which will be for a relatively short term engaged. It is also noticed that trust relations existed between the donor experts and most of the top level, because they were involved in the identification and formulation of the programs and they lived in or visited the country regularly over a long period of time. The balance of trust seemed, however, to break with the arrival of the commercial companies with their own expert groups. The inexperience of most Yemeni leaders in dealing with commercial "outsiders" made them to take distance from the program interventions and leave the daily actions over to lower-level personnel, who give again briefings to the top. Only during visits of the donor organizations they appeared themselves in meetings again.

The above description leads the researchers to the following suggestions: donor organizations should make a distinction in programs directly geared to the top levels and other interventions. For the first group it would be advisable that the donors and Yemeni top jointly appoint experts who would be recruited by the donors. It is clear that in the present free market policy, this recruitment would not be possible, but my argument is that the top leaders would better relate to an expert directly connected to the donor organization than to an expert from one of the commercial firms. Jointly, the donor experts and the top men and women could develop programs in which the experts would take the role of coaches. Where specific knowledge would be needed, the coaches could make use of funds to invite, in consultation with the donors, specialized experts. Jointly they would implement the agreed protocols signed by the donors and the minister in charge. The relations between the top and the coaches should be based on trust, where experiments can be done with transparency and accountability and where additional knowledge for carrying out the functions should be provided without having the top men or women losing face. The appointments of the donor experts should be independent from the three- or four-yearly newly formulated programs implemented by winning contractors.

While this coaching is taking place, commercial firms can implement their interventions at the lower level through skills training combined with equipment, materials, and fellowships. Through the relationship at high levels and the results of the commercial firms, the coaches and donors will also learn why certain policies and strategies are not (yet) feasible to undertake. They will get more understanding of the local knowledge in the sector they are working. The increased knowledge will also help to define what kind of assistance should be given, on what level, and what kind of local organizations and systems should be established, including training programs, to make the assistance efficient. Sometimes the Western models will not be sufficient.

If trust is established, experiments could be made in announcing positions based on qualifications in all these experiments the coach should be presented as to cover the face of the top men or women. Final decisions, however, have to be taken by the Yemeni partners. Other experiments could be undertaken by letting the minister or vice ministers explain the strategy for their sector to heads of departments and to let them discuss the implications for the different departments. The coach should have a monitoring role, instead of being the informant to the heads. The implications could lead to new job descriptions with new qualifications and that could be the start for the three- to four-yearly tender programs for different contractors.

The general lack of local knowledge which is shown in many analyses of the conflicts in Yemen and which makes it difficult for donors to work in Yemen leads me to propose to build a Bank for Local Knowledge where, with the help of Yemeni and foreign experts, past and present development programs in Yemen are analyzed. In particular, the focus would be on those factors leading to success (or failure) of programs and projects, who played the main roles in them, and lessons to be learned. This Bank would be a not-for-profit organization that would operate independently of the

government to ensure the neutrality of the reports. The Bank would provide reports at the request of ministries and donors, as well as data from the experts from Yemen and abroad with real expertise and experience.

The information provided in this article is merely a start to understand the necessary and valuable local knowledge that can be used as a background for donors and which can make or break foreign aid interventions. It is believed that donors intervention that needs dealing with policy makers, tribal or governmental leaders, and employee has to be addressed first. Donors' lack knowledge of the rules of the informal system may lead to conflicts especially during aid design and/or implementation stages. Helping the donors on these aspects may reduce conflict and boost the expectations and generate ideas about what the aid intervention should look like.

In the experience with Dutch consultants who were sent to universities in Yemen by Dutch university aid programs, there were many complaints that Yemenis did not take them seriously, that they were seen as pocket fillers, and that there was a lack of trusting work relationships. In a study that was done by Elayah (2014) about "Donor-Promoted Public Sector Reforms in Developing Countries and the Local Knowledge Syndrome," the author researched 4 of 13 projects that were set up within the NPT (the Netherlands Programme for Institutional Strengthening of Post-secondary Education and Training Capacity) with various universities in Yemen and concluded that only those projects that were important for Yemen, and where there were stable interactions between Dutch experts and their Yemeni counterparts, were successfully completed. The master's degree program for professionals in business administration from the University of Sana'a got enough support from the local private sector to set up a commercial study, and the Water and Environment Centre cultivated interest among private and public companies to enter its master's program, because water is vital to the population. But for the two other projects the author researched – a master's program in public administration for government personnel and a master's in gender – the results were poor, despite the motivated commitment of Dutch consultants. This was because, apart from a small group of immediate stakeholders, there was no interest in improving public administration, let alone in the improvement of male-female relations. In fact, such "novelties" from the West are met with suspicion. The quality of knowledge on the public administration and the gender issues provided by the Dutch experts was not sufficient to establish a situation of trust where the Yemeni partners could learn by doing so.

This lack of trust resulted more in conflicts about organizational cultures and working styles than fundamental discussions on how Western models could be integrated into Yemeni settings. A chance for the Dutch partners to gain from the local knowledge was lost, and the Yemeni partners could not accept the Dutch models without damaging their own positions.

The provision of local knowledge may help donors to overcome such difficulties. e.g. the Ministry of Finance MoF has established in every government agency a department with a representative from MoF that provides the essential information and knowledge budget, yearly bonuses, training staff in new accounting and systems and other related aspects. It is noticed that most of the planning departments leaders in most of the ministries dont have a background in planning or economics and are not able to keep abreast of the new developments in sectorial planning. The reason is that the staff is not competence in English language as the way of communication in training programs applied by the donors. in addition, knowing that the salaries of the civil servants depend on the level of education, and the competency system is not yet applied or accepted. The negotiations on in-service training may required other ways of operating to attract civil service to adopt these development programs. It is important to know who is the leader in the development, and his/her background to know whether he/she has experience in what program and with what results.

Also, for education and training institutions for civil service, it will be important to know where do the students come from and how are they recruited. Local knowledge should be available

on the level of the teachers and trainers and the relevancy of the education and training program. In that way donors should target the assistance in a more efficient and effective way. Another example: informal institutions in Yemen are relevant in the framework of gender equality. Engaging women in public organizations and other local initiatives is crucial to enhancing gender equality, as is changing norms and attitudes by designing appropriate formal institutions. There is a need for empowerment of women outside the dominant social groups, especially those in tribal and rural areas who could gain control of their lives and participate in leadership. This could be done through identifying and addressing issues that cause women to be powerless in society. There is a need to establish special organizations that involve marginalized women without being controlled by the existing top women bodies. That will ensure empowering women from other social and economic groups, advocating open access to leadership, and making the empowerment of such woman a national and international priority.

Based on the analysis in this article of the functions of the civil servants in Yemen, the researchers also propose some basic managerial skills below that could be useful for capacity building. These proposals bear in mind the role of the informal institutions as explored in the earlier sections and would encourage civil servants to redefine the clients they are working for, namely, the public and not their leaders, and to improve corporate policies, strategies, effective human resource management, and communications in line with the social structure or context (Al-Assad 2013). Both employees and managers in the civil service need to be well educated and well motivated, capable of not only administering, developing, and analyzing public policies fairly and appropriately but making effective and participatory decisions, developing strategic plans for an organization, and developing a plan of action and a basic budget based on the strategic plan. Top positions should be competitive, based on clear job descriptions and requirements.

Leadership development is neither new nor unique to the public sector. People want leadership in the public sector, looking for are individuals who will encourage institutional adaptations in the public interest. Leadership in this sense is not value neutral. It is a positive espousal of the need to promote certain fundamental values that can be called public spiritedness. The most important role of public sector leaders is to solve the problems and challenges faced in a specific environment (OECD 2001). There is a need to develop the leadership skills of public servants to create an effective public sector responsible for achieving real development, through: (a) stimulating and implementing team-building exercises, (b) sharing the responsibility for activities and putting quality first, (c) setting up and implementing a monitoring and control system for changing processes, (d) establishing reference groups to discuss and defend visions within an organization, (e) establishing reference groups to discuss and defend visions with the beneficiaries of the interventions, and most importantly (f) introducing and maintaining ethics and values such as transparency and accountability. In addition, there is a need to build skills related to time management in order to close the open-door tradition.

It is frequently observed that newly appointed managers remove, distance, or freeze out the inner circle of their predecessors and appoint their own people. It is not uncommon to find in a specific ministry a considerable number of people who carry the same surname or tribe name as that of the senior manager/administrator, which can lead to a difficult climate of interpersonal conflicts among different circles within the organizations. At the same time, most organizations use a traditional approach to management. In the process of training staff, there is a need to promote those employees and managers with pronounced leadership skills such as (a) ability to manage conflicts and settle disputes effectively based on the formal rules and regulations, (b) vision to set up and implement a reward and punishment penalty system, (c) being creative in solving problems, and (d) being a critical and/or analytical thinker.

Good communication skills are also very important, because every administrative function and activity involves some form of direct or indirect communication, be it planning, organizing,

leading, or monitoring. There is a need to develop the capacity and capability of employees and managers in terms of setting up and implementing a communication system, developing meeting skills, setting up a reporting system, and developing reporting skills. Furthermore, there is a need to develop the capacity and capability process of employees and managers to deal with physical barriers by ensuring that they (a) make use of modern technology such as e-mails, (b) communicate with different organizational levels, and (c) read and comprehend information.

Human resource management is poor in Yemen due to the absence of both a strategic vision on civil service management and development and a vision of civil service training delivery. Public administration in Yemen has no effective and efficient feeder organization to provide high-grade civil servants and in-service training. This gap can be filled by (a) devolving the capacity of the leaders and their subordinates to define the functions and job descriptions of the organization, (b) introducing and implementing an evaluation system of functions and jobs, (c) setting criteria for evaluating the performance of current employees, (d) developing an employees' upgrading program, (e) identifying the shortcomings of current employees to fulfill new jobs and functions, and (f) setting up and implementing a system monitoring and controlling process. Other human resource management tools should also be improved, in particular periodic assessment and the drafting of career paths.

Clearly, there are many other managerial skills and functions of equal significance, such as public relations skills and financial skills, as well as capacity and capability building needs such as managerial knowledge and skills. It would be impossible for a donor intervention to set up a self-sustainable civil service training system by merely tackling the supply side or focusing on building skills for civil servants. There should be a rational and strategic approach for the civil service training sector that shows who the civil servants are and which administrative level they belong to. It would be illogical to leave the decisions on training to an individual civil servant on the basis of their own interests and whether they can get their ministry or their employer to finance the training.

## Conclusion

To comprehend the dynamics of the Yemeni public sector, one must look beyond written laws and regulations, and institutional rules and procedures, to examine the informal rules of the game that govern organizational and individual behavior. The influence of informal institutions and organizations is reflected in government officials' distinctive and informal style of decision-making, management functions, and interpersonal relations.

Regardless of the quality and the effectiveness of the Yemeni top man's or woman's leadership, the power of the top man or woman is not derived from formal or quality choices at a senior level in the organization intended to smooth wider distribution of control. Instead, it is derived from the "bottom" of the hierarchy as social value, where individuals choose to admit a legitimate top man or top woman. Thus it is not sensible to consider the top woman as a local agent for empowering ordinary women. She knows that the real empowerment of ordinary women in society will create new centers of power and will diminish her own position.

Information on local knowledge may help outsiders such as aid contractors and aid policy implementers. Aid policy implementers need to be aware that local people might not accept imported principles and practices. Building the capacity of the civil service system in Yemen remains a necessity, while there is no framework on which the system can build. Foreign experts are needed to make effective change. They are, for the most part, trusted in Yemen. But it will only succeed if donors invest for a significant period of time and resources in local knowledge about who the actual leaders are, who to negotiate with, and how much confidence can be vested in people within the chosen sectors. The top men and women need to be part of the change process, and assurances have to made that they will not lose their positions through the changes, so that

they are supportive. Donors should shift their focus from the middle men and lower positions to the top men or women and their key players and carry out a training program that is knowledge- rather than skill-based. That could be done through establishing Yemeni Local Information Bank (YLIB) that can deliver formal and informal information on local knowledge for development programs and projects on the national and local levels before investments are made.

# Building Reform Capacity

Goran Sumkoski
Graduate School of Global Governance, Meiji University, Tokyo, Japan

## Synonyms

Training for administrative reform

## Definition

Building reform capacity is creating sustainable mechanisms that promote economic regeneration and identify a range of microlevel skills by including both technical skills as well as reform mindset,

attitude, and leadership to introduce and manage change.

## Introduction

The global trends in the capacity building approach of public administration officials in developing counties are broadly following the last decades' paradigm shift of the developed countries toward the model of New Public Management. The global spread of this paradigm shift follows a fundamental alteration in the balance of state responsibilities such as movement away from attempting to manage the whole economy through command-and-control hierarchies toward creating conditions for growth, and it is helped by a wide variety of local, regional, and global actors such as international organizations, transnational policy networks, think tanks, etc. Moran (2001) further links these developments to the rise of the liberalization and privatization and the rise of the New Public Management concept building on the old Weberian and Wilsonian dichotomy between politics and administration, in which politics decides upon the desired output and outcomes, while public administration merely executes tasks.

The international development organizations have been instrumental in capacity building of public administration officials in developing countries necessary for, firstly, initiating and implementing and then managing in a sustainable manner such institutional and policy frameworks in professionalized public administration models. More specific capacity building training of public officials for instilling reform attitude and mindset is necessary for supporting the already implemented institutional legal and regulatory transplants in developing countries based on global models such as independent regulatory agencies, investment promotion agencies, free economic zones, tax compliance agencies, trade customs and tariffs models, competition agencies, ombudsman, etc.

## Capacity, Mindset, and Attitude Transfer

The question is to build capacity for doing what. The reform mindset and attitude change is intended to increase aggregated individual capacities of civil servants for managing and implementing the already established institutional and policy frameworks by effectively performing administrative functions, solving problems, and setting, achieving, and measuring goals and objectives (Farazmand 2009; Mentz 1997; North 1990). Public administration officials play key role in shaping and delivering policy outcomes "by initiating reforms and supervising bureaucratic practices" (Rodrik 1996; Gray and Gonsales 2002). The implementation capacity factor, once the institutional and policy transfer is completed, is becoming a key factor to the success of policy transfer (Evans 2004). For instance, findings in comparative policy analyses are that public leaders shape policy outcomes by initiating reforms and supervising bureaucratic practices. This institutional entrepreneurship is often seen to be the work of actors who are able to mobilize resources to enable collective action (Ostrom and Ahn 2008). Through their identification of new opportunities, creative and innovative addressing of issues, these institutional entrepreneurs infuse new innovative values, tools, instruments, and practices (Garud et al. 2002).

This has led to a quest to go beyond technical and content-specific training as a predominant form of capacity buildings implemented by the international development organizations and toward corresponding leadership skills training aimed at both mindset and attitudes, complementing the previous approach of more generic training on wider economic and social issues. In effect, there is now an agreement among scholars and practitioners that managing reforms, beyond technical skills, requires attitude and mindset that can change and adjust institutions in order to meet and anticipate changing circumstances (Stimson 2004). Introducing the need for skills beyond technical and content expertize, the institutional theorists argue that good institutions breed good leadership in the long run, so most research conflates leadership, mindset, and attitude with institutions (North 1990). Driscoll and Morris (2001) claim that major changes in the public sector are problematic or unsustainable unless the value and belief systems of the organizational members

experience a similar change. Hence a more systematic approach began to emerge with increased understanding of the importance and focus not only on skills but also on values and attitudes. This change of focus follows a similar trend in development theory that is converging toward a wider agreement of the need for inclusion of institutions into economic development research in general (North 1990; Acemoglu et al. 2005) and more recently in the theory and practice of public administration in particular (Levi-Faur 2005).

The institutional models as a reaction to earlier behavioral theories of organization focus on the need to modify collective values, culture, and structure to make the organization adaptive and dynamic (Farazmand 1997). Reform of public administration takes place through changes and modifications of not only the internal structure but also through changes internal organizational values and culture and their interaction and mutual adjustment (Farazmand 2009). This notion perfectly aligns with the dynamic view of the institutions beyond the system of laws and regulations but including the people, their capacity, and technical skills, and maybe even more importantly and what is a subject of this research, their willingness and attitude to apply its skills in creating policies and implement them through their institutions. This research provides a more granular analysis of the theoretical embedding of the institutional approach to public administration by focusing on confirming the re-constitutive links between the structure of institutions, laws, and regulations and the organizational values of people that run them. The results of this research appear to support the argument for further inclusion of institutional theory into administration reform theory beyond the "hard" institutions or structure and into a "soft" institutions such as organizational values and reform mindset.

The current, broader approach to capacity building by the international development organizations in developing countries is based on promoting change and introduction of novel models of governance through three correlated and coordinated notions such as institution building, policy transfer, and, capacity building in public administration officials. The focus of this research is on the third part of this wider definition of capacity building and more precisely on whether reform attitude and mindset of civil servants can be induced by training programs. Hence, the capacity of public administration officials in the context of business environment reform as a subject of this research may be defined by expanding Farazmand's (2009) definition of "the capacity to create sustainable mechanisms that promote economic regeneration and identify a range of micro-level skills" with "including both technical skills as well as mindset, attitude and leadership to introduce and manage change." It begins by the skills for identifying the existence of a problem, therefore of the necessity of a reform, and mindset and attitude for developing and implementing a viable solution for the identified obstacles. This gives an opportunity for attitude and mindset change to be analyzed as a separate capacity building concept and component.

## Methodology Scope and Approach of Public Administration Training Evaluation

Consequently, for this purpose in this paper, the working definition of analyzed capacity building is the one focusing on mindset and attitude as ability for leadership, managing change and the ability to influence institutional and policy processes and practices. The conceptual framework for this research is based on the more specific definitions of behaviors as institutions that both constrain and enable behavior, and even more so, the only way in which we can observe institutions is through manifest behavior (North 1990). The research sought to fill these gaps by asking: "Whether international organizations training programs were successful in changing the attitude and mindset in terms of leadership for managing change in trained public administration officials?"

The empirical analysis assumed the following model in order to observe the contribution of the training program toward changing the mindset of participants, as a core group and a control group consisting of public officials that were not part of the capacity building program.

| Activity | Outputs | Outcomes | |
|---|---|---|---|
| | | Immediate | Ultimate |
| Training | Knowledge and know-how | Change in perception | Change in attitude |

This study illustrates the issue of mindset and attitudes for managing with an empirical analysis of the learning programs for public officials in Tajikistan and in Bangladesh that beyond institutional and policy reforms were tasked with the change of practical and core beliefs of administrators who have taken part in trainings received by international organizations. All statements of the questionnaire were made subject to the Cronbach's alpha test, tests for normality, and a two-sample t-test and the z-approximation of the Mann Whitney U test that determines the differences in the mean ranks for each group.

## Data Collection

The empirical study was conducted in two countries with rather different administration systems and approach to staff training and job promotion in order to test whether such differences will lead in different outcomes in the impact on the mindset and attitude for leading and managing change from the two similar capacity building training programs. The study considered two populations: core group officials who received the training and control group that did not. A total sample of 80 respondents, 40 respondents from each group, drawn from the trained core group and a control group from the same level officials not involved in the training was interviewed in Bangladesh, while in Tajikistan the total sample was 36 with 18 respondents in each of the core and control groups.

### Tajikistan

The establishment of FEZ concept in Tajikistan was done with support by a number of international organizations such as UNDP and GIZ, providing in the period between 2010 and 2015, 11 international experts were working directly with the 2 FEZ and the MEDT and key government and private sector stakeholders. The support was varied and cross sectional, covering all key areas necessary at the initial stages of development of FEZ such as technical support at national level with developing national FEZ strategy in Tajikistan, study tour to Turkey that initiated the idea of establishing the FEZ concept in Tajikistan, support to two FEZ with developing strategic and operational plans, as well as support in various operational aspects such as developing marketing strategy, internal organizational plans, website, etc. The survey (The survey was conducted by the author in 2015 in Tajikistan.) was conducted in 2015 among the managers and staff of the two free economic zones that were not subject to training giving a natural control group within this survey and the 2 FEZ zones and the FEZ department in the Ministry of Economic Development in Tajikistan that were subject to various capacity building interventions in the period between 2010 and 2014 and are directly involved in management and administration of the FEZ.

### Bangladesh

The World Bank designed and implemented a Regulatory Reform Core Group Training Program in Bangladesh to improve the learning of content and shift the mindset of bureaucrats from that of a regulator to a facilitator. The project provided a series of tailored capacity building training with an aim of changing attitude of the government officials that would lead to identification, initiation, and implementation of regulatory reforms for private sector development. Recognizing the critical role of mid-level bureaucrats, a civil service training program was implemented between 2008 and 2011 to build a community of reform minded mid-level officials (Senior Assistant Secretary, Deputy Secretary, Joint Secretary levels). The program's objective was to sensitize participating civil servants about issues influencing PSD and to build their capacity to advocate, implement, and monitor needed reforms becoming change agents for PSD within the bureaucracy.

The project used learning-by-doing methods: seminars, lectures, training workshops, study tours to observe, first-hand experiences, international good practices, and exercises to analyze regulatory issues and propose solutions. The study was conducted between November, 2011, and June, 2012 (This study was conducted by Chowdhury Golam Kibria, an Associate Professor of Jahangirnagar University, Dhaka, Bangladesh; Syed Estem Dadul Islam, a Monitoring and Evaluation officer; and Sigma Shams, an M&E Consultant.).

## Results of the Empirical Analysis and Conclusions

The results appear to confirm that the capacity building efforts by international development organizations, if properly targeted and designed, can have a positive and measurable impact on the attitude and mindset in public administration officials to initiate and provide leadership in the reforms. The results of this study appear to support the theoretical argument for inclusion in the administration theory of the organizational values and reform mindset and attitude of people that run institutions beyond the focus on the structures and "hard" institutions such as institutional and policy transfer. This quasi-experimental study establishes reasonable evidence that the capacity building training programs succeeded in creating a difference not only in the technical skills and knowledge but also in the perception, mindset, and attitude of the public officials toward initiating and managing reforms. Both training programs evaluated here followed initial institutional building and policy transfer and fostered an inclusive and proactive reform outlook among the trained public administration officials. In both countries they were implemented in parallel or followed initial institutional building and policy transfer interventions. Majority of the respondents were able to incorporate their reform and management of change learning in their work, and some have taken independent initiatives to facilitate reforms. Participation in training has not only increased their knowledge of reforms and awareness of scope for reforms within their jurisdiction but also changed their mindset and attitude toward reform-related issues and their role in implementing such reforms in their countries. It also seems to be the case that the two very different administrative environments, legal and cultural, are not an obstacle for instilling such a reform mindset. There is also an indication that the acquired mindset trickles down to new incoming members of the teams that participated in the training through internal training system and mentoring. The lessons drawn from the results of this empirical research are that, firstly, it is possible to change mindset and attitude for identifying, initiating, and leading change in public administration officials in developing countries. Secondly, while it is essential for the institutional transplant and policy transfer to be supported by the capacity building for technical skills, this is not enough for managing such complex changes. It is also of a key importance to complement it with specifically targeted training that promotes reform mindset and attitude for leading such complex changes.

# Bullying in Organizations

Frank L. K. Ohemeng
Department of Political Science, Concordia University, Montreal, QC, Canada

## Synonyms

Coercion; Extortion; Hectoring; Imperious; Intimidation; Overbearing

## Definition

A situation in which one or more persons, over a long period, perceive themselves to be on the receiving end of systematic negative treatment by one or more other persons, and where the person or persons exposed have difficulty defending themselves (Matthiesen and Einarsen 2007: 735).

Bullying is an escalated process, where the person confronted ends up in an inferior position, and becomes the target of systematic negative social acts (Einarsen et al. 2011: 22).

A repeated, health-harming, mistreatment of one or more persons (the targets) by one or more perpetrators, that is, threatening, humiliating, or intimidating, or work-interference, that prevents work getting done (The Workplace Bullying Institute).

## Introduction

The past few years have witnessed the rise of workplace bullying in both public and private sector organizations. It has led to the development of social movements, such as Me Too, Black Lives Matter, and a few others, which call for an end to it. Not only have these movements brought these issues to life in the public domain; in both developed and developing countries, continuous scholarly attention has resulted in growing interest in workplace bullying and other forms of interpersonal conflict (Branch et al. 2013). High profile cases involving senior politicians and bureaucrats continue to be reported in the both the print and electronic media in many countries. Yet, as explained by Carbo (2017), "the phenomenon of workplace bullying is still not completely understood. There are still today too many myths and misunderstandings about bullying."

The rise of workplace bullying, especially in public organizations, has caused governments to institutionalize various mechanisms to address or intervene in what many see as a social cancer. They do so in the wake of serious consequences, including severe effects on workplace health and safety issues that can significantly undermine the

performance of both individuals and organizations (Einarsen and Hoel 2010).

According to Suggala et al. (2019), workplace bullying is considered both a direct and an indirect behavior: a spectrum of violence that is not necessarily any one type of misconduct, violence, or incivility. It could comprise unfriendly behavior, impractical deadlines, mocking, separation, dismissal, unachievable goals, sabotaging careers, threats, professional elimination, condemnation, or humiliation. Another important aspect is that it "involves a temporal dimension whereby the behavior is sustained over time, involves regular occurrences, reflects power disparities (not necessarily hierarchical), and is systematic in nature (i.e., thought through or planned by the perpetrator)" (Samnani et al. 2013: 339). Workplace bullying thus means behaviors that are negative and are unwanted by the victim and are more often psychological than physical in nature (Einarsen et al. 2011).

Nielsen and Einarsen (2018) identified three main characteristics. First, an employee becomes the target of systematic negative and unwanted social behaviors in the workplace. Second, the exposure occurs over a long time; and third, the target experiences an inability to easily escape the situation or stop the unwelcome treatment. It is thus the persistence, the systematic nature, and the feeling of being trapped and victimized that distinguish bullying from other forms of workplace aggression and mistreatment.

## Types of Bullying at the Workplace

While it is clear that workplace bullying is unacceptable behavior, scholars have been unable to come up with a complete or definitive list of precisely what types of behavior constitute it. Consequently, it can be said to take many forms. Here we focus on the categories developed by Carbo (2017), which take into account what others have discussed from a broader perspective.

According to Carbo (2017), workplace bullying can be classified into three main forms: personal level, organizational, and by proxy. Personal level bullying occurs at a micro or personal level. There is no reliance on organizational policies, but that does not mean it is not linked to policies, inasmuch as they allow it to occur or, even, encourage it. The tactics are engaged in through direct interaction between the bully and his or her target. This form of bullying includes the use of any form of communication or lack thereof: yelling, berating, talking down to, threatening, or ostracizing and ignoring (as well as many other tactics the creative bully might come up with). This form of bullying often includes unlawful forms of harassment, such as sexual or race-based harassment.

The second form is organizational policy bullying. Here, the bully directly uses an organizational policy to torment their targets and does not include the reasonable application of reasonable organizational policy. Often the perpetrator exploits ambiguous or subjective policies to demean or degrade. This form of bullying often includes unfair evaluations, overloading with work tasks, assignment of menial tasks, or taking away the voice of the target by stripping them of autonomy. Bullies who have the power to implement organizational policies often indulge in this form of bullying.

The third type of bullying is by proxy, where the bully uses others to achieve their goal of inflicting pain. They may force the proxy to use a policy against the target: or it might be through gathering a mob, where others join in with them; or it might be by allowing and encouraging the proxy to engage in what amounts to personal or organizational policy misbehaviors. Many bullies engage in all of these forms, and many targets experience all of them.

In his study, Namie (2007) has identified four types of bullying behavior. These are: the screaming mimi; the constant critic; the two-headed snake; and the gatekeeper. According to him, the screaming mini publicly humiliates their target to instill fear and paralyze witnesses. Screaming, yelling, swearing, and throwing things may all feature. The constant critic is described as a "hypercritical nitpicker." Such a person picks on targets by branding them "incompetent" and methodically campaigns to destroy their victim's career. The third type of behavior is the two-

headed snake, a "duplicitous Jekyll-and-Hyde creature," destroying targets through rumors and engineering divide-and-conquer schemes. Finally, there is the gatekeeper. This bully, according to Namie (2007), is a control freak who withholds resources the target needs. The gatekeeper "steals credit, fawns over favorites, and isolates and torments the unfavored."

## Factors in the Rise of Workplace Bullying

Bullying at the workplace does not just happen. It is deliberate and conscious: a planned attempt by an individual to hurt someone. Scholars have, however, identified various factors that may facilitate its occurrence (Tuckey et al. 2019). First are the characteristics of the workplace environment; the organizational culture may make bullying easy. Einarsen (2005) says that "the quality of the psychosocial work environment seems to be an important cause of bullying. A work situation characterized by role conflict and a lack of interesting and challenging work tasks, combined with a negative interpersonal climate in the work group, seems to be a high-risk situation for bullying" (7).

Some scholars are of the view that an organizational environment that promotes masculinity at the workplace leads to bullying (O'Donnell and MacIntosh 2016; Pauksztat and Salin 2019). The literature points out that most workplace bullying is perpetrated by males on women (Pauksztat and Salin 2019). This does not mean, however, that males are not bullied by their male or female counterparts at the workplace. It is the level of prevalence, which makes it difficult for men.

Social categories are also believed to be instrumental in increased workplace bullying (Pauksztat and Salin 2019), including, say some scholars, gender. A number of studies continue to show that women in particular suffer much workplace abuse (Pauksztat and Salin 2019). Some have reported abuse of men, but males seem less inclined to report it, and to keep such things to themselves. Age is another element, and older workers may endure more bullying, although others maintain that younger workers are more exposed to bullying simply through their overrepresentation in the workforce (Einarsen and Skogstad 1996; Schat et al. 2006).

Organizational power is also thought to figure in the rise of workplace bullying (Zapf et al. 2011). In fact, Hodson et al. have described the workplace as "an arena suffused by power relations," and such powers are sometimes misused. It is therefore not surprising that bullying has significantly been attributed to supervisors, in what has been called abusive supervision at the workplace (Zapf et al. 2011). Abusive supervision is defined as "subordinates' perceptions of the extent to which supervisors engage in the sustained display of hostile verbal and nonverbal behaviors, excluding physical contact" (Tepper 2000: 178). Workplace supervisors may attribute their abuse of their subordinates to poor performance or violation of norms, or exhibiting other undesirable behaviors.

## Impact of Workplace Bullying

There is a consensus that workplace bullying has tremendous negative effects on both employees and their organizations in general. The most critical impact, though, is on the performance of the employee. The literature has consistently identified low performance and productivity as the most obvious repercussions of bullying. On the individual level, bullying can generate significant psychological and physiological problems. For instance, a number of researchers have discovered that bullying impairs sleep. According to Hogh et al. (2012), "targets of bullying are more likely than nontargets to have sleep difficulties, a lower sleep quality, and more often use of sleep-inducing drugs and sedatives compared to non-bullied respondents." The consequence of such sleep disorders is that such individuals are unable to function as expected in the workplace. They have less energy and may feel disoriented.

One important way scholars have identified to improve productivity is employee engagement (EE), involving "a positive, fulfilling, affective-motivational state of work-related well-being that can be seen as the antidote of job burnout" (Bakker and Demerouti 2008: 187–188). Employee engagement is defined as "the

simultaneous expression and employment of a person's 'preferred self' in their work task, thereby promoting connections to work and to others, personal presence (physical, cognitive, and emotional) and active, full role performances" (Kahn 1990: 700).

Workplace bullying, however, significantly undermines EE (Rai and Agarwal 2017; Law et al. 2011): as Meriläinen et al. (2019) explain, both directly and indirectly. To them, bullying decreases engagement through an employee's unsatisfied needs for autonomy, competence, and relatedness (1207). Park and Ono (2017) have further explained that exposure to workplace bullying decreases work engagement of employees and increases their health problems due to their perceived high level of job insecurity.

Bullying can also lead to such problems as absenteeism, employee burnout, high employee turnover, and loss of job satisfaction (Einarsen and Hoel 2008; Gordon et al. 2017; Niedhammer et al. 2013; Nielsen et al. 2016). Absenteeism, defined simply as "the failure to report for work as scheduled" (Johns 2008: 160), may be used by the bullied as a means of coping with the resultant trauma. In other words, those who experience bullying may stay home as a way of dealing with what they have gone through. They may be avoiding the perpetrator. Work in general may be affected. Employees who feel unfairly treated may express anger and outrage through subtle acts of retaliation against their employers, including work slowdowns or covertly sabotaging the abuser.

## Addressing Workplace Bullying

The negative effects of bullying on both the individual and the organization have led to calls for ways to address this social cancer at the workplace: how to manage as well prevent it. These calls have led to the development of a number of strategies (Caponecchia et al. 2020).

One of the most discussed in the literature is legislation or, simply, passing laws that will stop people doing it (O'Rourke and Antioch 2016; Stephen and Sasi 2017). Although many countries have labor laws that require employers to maintain a safe workplace, many feel that they are too general and broad to go deep enough in addressing bullying and are calling for specific legislation that includes elements of reporting incentives for victims, as well as punishment for perpetrators (Ferris et al. 2018; Stephen and Sasi 2017).

Institutionalizing training on workplace bullying could also go a long way. Not a few organizations have training regimes for their employees to identify bullying behaviors and that may be available to victims, as well as procedures for reporting and addressing such abuses. In addition, they clearly stress punishment for the bully. Thus, training should be about more than providing opportunities for learning and include "what needs to be trained, who needs to be trained, and what type of organizational system you are dealing with" (Salas et al. 2012: 88).

Work or job design is also seen as another way of helping prevent bullying at the workplace. It is perceived as "the content and organization of one's work tasks, activities, relationships and responsibilities" and has been linked to virtually every important organizational outcome domain, such as performance, safety, well-being, and innovation (Parker 2014: 662). Tuckey et al. (2019) have identified three main ways job or work design can help: the primary, secondary, and tertiary levels. According to them, primary interventions attempt to address the causes in work and organizational factors, such as organizational climate, job demands, and job resources. Secondary interventions attempt to reduce the effects of bullying on employees by modifying their reactions to bullying exposure through improving problem-focused coping strategies or environmental coping resources, such as higher autonomy or reduced task complexity. Tertiary interventions focus on managing the resultant mental health symptoms experienced by workers after being exposed to bullying at work, including depression, psychological distress, and emotional exhaustion, by providing professional services to treat the condition (7–8). It is thus believed that addressing issues relating to job design in the organization can help stem workplace bullying.

## Conclusion

Workplace bullying has been on the rise for some time now in both developed and developing countries. It exists in both the public and private sectors. Its prevalence has been a source of concern to government, private ownerships, labor unions, and individuals. The epic proportion of employees who continue to experience bullying has therefore led to a call to both government and private ownerships to do more to curb this social cancer. The idea underpinning this call is that bullying impacts both the individual and organizations at large. At the individual level, it may cause significant stress, leading in some cases to marital problems and, even, suicide. At the organizational level, it affects relationships, creating what has been described as a toxic workplace environment, and damaging overall performance.

While various measures, such as training and policies, continue to be undertaken and put in place, it is believed that these are not sufficient. Many have therefore called for effective enforcement of policies dealing with bullying, as well as institutional mechanisms for reporting, and then addressing, such reports. Bullying does not respect age, although it has been noted that different social categories experience bullying differently and at different frequencies. The need to address bullying at the workplace is of critical importance in an era where diversity and inclusion have become essential not only at the societal level, but at the workplace, to create a conducive environment for all.

# Bullying in Public Administration

Orlanda Diaz-Garcia
University of Castilla-La Mancha,
Talavera de la Reina, Spain

## Synonyms

Leadership; Mobbing; Organizational structure; Power; Spanish public administration; Work harassment; Workplace harassment

## Introduction

Analysis of the organizational structure of the Spanish Public Administration and the prevention of psychosocial risks are two key approaches to address bullying (workplace harassment). Work harassment situations violate the respect and dignity of human beings, and such infringements harm the health of both the worker and the organization's productivity (Luceño et al. 2008).

A conclusion reached from the review of research studies is the need to consider the public administration as a work environment which favors this kind of behavior (González-Trijueque and Graña 2009).

## Theoretical Framework

To specify the theoretical approach to the conceptualization of bullying, this phenomenon is defined as:

> A set of behaviors – of different types (emotional, cognitive, behavioral and contextual) and severity – made towards a person and/or their labor context, which by its own nature, duration and repetition are harmful for the members of the organization and, in most of the cases, also for the organization itself. (Escartín et al. 2012, p. 42)

Research on the effects of this problem has focused on both the psychological impact on the victim and the organizational dimension. Work harassment is known to have an enormous impact on people's health and on the effectiveness of organizations (Barón et al. 2003). Regarding the psychological consequences the victim suffers, the review by Ovejero (2006) evidenced a great variety of consequences: loss of confidence (both in oneself and in one's professional capacity), feelings of personal unworthiness, development of guilt, sleep disorders, anxiety, stress, distress, depression, nervous breakdowns, irritability, hypervigilance, tiredness, weakness, personality disorders (obsessive, repressive, or resigned), emotional insecurity, clumsiness, and indecision, amongst others. In more recent research, Ovejero et al. (2011) consider that the consequences can be summarized as "posttraumatic stress disorder" and that the "consequences are so severe that the victim often is occupationally evicted for life, and in some cases [it] even leads to suicide" (p. 186).

Research of the cost of work harassment for organizations has shown a number of consequences for those entities that favor, or simply allow, these abuses. Negative effects at the organizational level can be seen in reduced production due to sick leave, incapacity, poor performance, absenteeism, and high turnover (Luceño et al. 2008; Rodríguez-Muñoz 2011). Rodríguez-Carballeira et al. (2008) also established a correlation between workplace harassment and a rise in workplace accidents.

## Approach to Background and Predictors of Work Harassment

The study of workplace harassment is a research area that has become greatly relevant in organizational contexts. There is no doubt that the structure and organization of the workplace determines whether the problem emerges and subsequently proliferates. The meta-analysis of Topa et al. (2007) concludes that organizational characteristics are the best predictors of harassment. Empirical evidence supports the relationship between factors of organizational environment and work harassment, taking into account that risk factors of this problem can be found in the work environment as a result of social structures and practices of organizations where it occurs (Hirigoyen 2014; Moreno-Jiménez et al. 2005; Salin 2003). There are toxic organizations with structural characteristics that increase the probability of the occurrence of both harassment and other occupational risks, such as psychosocial ones (Piñuel 2004). Labor organizations where harassment appears are most likely to be large, bureaucratic organizations, with stressful and competitive work environments, high workloads, little or no freedom for workers to express ideas and opinions, and high control over the tasks workers perform. There will likely be unclear roles for workers, dissatisfaction felt by civil servants with the social climate and internal communication within the company, and highly incohesive work groups (González-Trijueque and Delgado 2008; Rodríguez-Muñoz et al. 2006).

There already exists a significant amount of empirical data which one can explore with some rigor as to the causes and background of work harassment (Boada et al. 2003; Einarsen and Hauge 2006; Rodríguez-Muñoz 2011). Causative factors of work harassment are very diverse; however, two recurring factors between the background and predictors have been found: namely, the power element and leadership style. There is wide consensus that the origin of work harassment is the abuse of power (Boada et al. 2003; Hutchinson et al. 2010). Closely linked to this is the relationship of power to certain types of leadership considered to be the background of harassment (Peiró and Rodríguez 2008; Segurado et al. 2008).

Rodríguez-Muñoz et al. (2006) state that the occurrence of work harassment is closely associated with leadership style and appears as one of the most important predictors of harassment. It has been noted that poor management by supervisors, with a lack of appropriate leadership style, favors the emergence of situations of harassment. Proper and preventive leadership against harassment is based on ability, training and management skills, with provision of reinforcement, motivation, and constructive supervision (Meseguer et al. 2007; Quero et al. 2012; Rodríguez-Muñoz 2011). This also demands a new generation of managers (Farazmand 2004). Many studies link work harassment to an authoritarian leadership style, but many also found a link to weak or laissez-faire leadership. There is a broad spectrum of research that establishes, as a predictor of work harassment, the authoritarian leader with poor leadership in training and skills, who instead relies on and utilizes power based on hierarchical supremacy (Einarsen and Hauge 2006; Peiró and Rodríguez 2008; Segurado et al. 2008). Also compelling are discoveries that link the problem with a laissez-faire-style leadership. This is not neutral leadership, but a passive and destructive form where the leader refrains from taking responsibilities and allows – and is thus an accomplice of – harassment (Einarsen and Hauge 2006; Rodríguez-Muñoz et al. 2012).

Organizations that favor work harassment are strongly hierarchical, which typically encourage, or show leniency toward, authoritarian leadership styles, whereby workers are subjected to considerable stress caused by high work demands and deficiencies in the organization, work management, and also in asymmetrical power relationships (Correa 2004; González de Rivera and Rodríguez-Abuin 2005; González del Rey 2007; Jurado 2008; Martínez 2007). Such asymmetry is inherent in all processes of harassment as a necessary ingredient from the organizational point of view (Correa 2006). This illegitimate power is found in offensive behavior produced toward the harassed and in the abuse or deviation of power (Martínez 2007; Motta 2008). These behaviors should not be confused with the legitimate power that can be harnessed by a superior. The deviation of power (or abuse of power) occurs when a superior uses his or her legitimate power for purposes other than legitimate ones. Specifically, it refers to the use of that power to destroy or submit (and possibly both) the psyche of the person who is being harassed (González 2009).

In the Spanish Administration, the hierarchy, with all its intensity, takes precedence; it is, in essence, a form of bureaucratic administration. The relationship between a strong hierarchy and arbitrary or abusive exercise of management ability has been extensively studied from the legal perspective (Pomares 2010). How this relationship is linked to fear and the potential of harassment, and the concordance with fear and possibilities of harassment, have also received significant attention (Lorenzo de Membiela 2007). It occurs "even more intensively, in the public sector, because of their strongly hierarchical structure and the civil servants' privilege of being immovable" (Gamero 2011, p. 92), where a kind of vertically descending scale of harassment at work occurs, whereby the highest number of workers who are harassed are at the bottom of the company's hierarchical structure.

As can be seen, studies about the exercise of power in the Spanish Public Administration refer to a type of leadership based on hierarchical supremacy. However, proposals for proper running of public institutions have proffered that the key lies in the training of civil servants and in the ethics of those who run and manage the administration (Rodríguez-Arana 2012).

## Power and Leadership as Antecedents of Bullying

Good management of City Councils guarantees a quality service to citizens and a healthy environment for human resources, with management becoming both productive and effective. Taking into account the regulations of the Spanish City

Councils, can it be inferred that the organizational structure complies with prevention of bullying?

The aim is to explore configuration of the organizational structure of the City Councils. Analysis of legislation that sets the organizational structure of City Councils will allow, from a psychosocial perspective, identification of those factors linked to the emergence of work harassment studied here: namely, power and leadership. To identify systems put in place to limit power and prevent abuse, it is also necessary to study the effectiveness of the Labor Inspection and Social Security (LISS) organization, regarding healthy management of workers in the Spanish Public Administration, with specific regard to work harassment. In this respect, the legal research advises of a worrying lack of performance by LISS against harassment in the Administration (Molina 2003). It is also considered appropriate to examine the level of supervision provided in City Councils by other administrative entities. The City Councils' relationship with such risk prevention and external supervision provides cross-information with all human resource activity and allows collection of information about limits imposed to the power that the entities have.

## Power

### Individual Role of Each Human Resource Profile in City Councils

**Political profile**: The profiles that bind higher levels of power together over other human resources, and whose main functions are presented here, are the Mayor and City Councilors – especially those that make up the Governing Body. The Mayor heads the government, the municipal administration, and personnel management. He or she is in charge of structuring and organizing the administrative services, with advice from the Governing Body (Royal Decree 2568/1986). In all the regulations, no obligation has been found to approve and commit to some kind of structure and organization (because of its sustainability, effectiveness, health, for example), therefore no responsibilities are assumed and there are no consequences of default. For instance, if different ways of attaining power are based on free will, the distribution of extra benefits are not fixed or regulated, and therefore, there are no indicators of which objectives are to be awarded. The power profile of the Governing Body derives from its free appointment by the Mayor.

**Administrative and labor profile (civil servants)**: The local Administration servant with a national qualification, the personal eventual, the civil servants, and the permanent staff. The legislation provides a civil servant of the local Administration who has a national qualification (a qualified civil servant) with broad-reaching functions that have a decisive impact on entire City Councils. He or she belongs to a differentiated scale of the General Administration and Special Administration (Royal Decree 781/1986, article 167). The two different functions of this type of civil servant are as secretary and controller and internal auditor of economic, financial and budgetary management, accounting, treasury, and collection (Law 7/1985, article 92a1). The denominated secretary has functions of legal authority and legal advice (Royal Decree 1174/1987, article 8), with decisive powers of control and supervision over municipal government bodies. The public function of controller and internal auditor of economic, financial and budgetary management, accounting, treasury, and collection belongs to the Municipal General Intervention (Law 7/1985, article 136.1). Some examples will show its decisive impact. For instance, if the Secretariat or the Intervention consider that a report is required, the matter will not be approved without it; the Secretariat decides on the appropriateness of approving an issue in Plenary Session (composed of the Mayor and all council members) or "leaves it on the table" (Royal Decree 2568/1986, article 92) without approval or express rejection. There is a responsibility for documentation in the constitution of the new corporation after municipal elections, the heritage inventory, audit, preparation, and updating of the economic receipts (Royal Decree 2568/1986, article 36). The Secretariat decides whether a matter should

be reported to the Plenary Session in full or in a summarized way (Royal Decree 2568/1986, article 93). In addition, it decides whether the information that has to be sent to the State and the Autonomous Communities is sent completely or only in part (Law 7/1985, article 56 and Royal Decree 2568/1986, article 196.3).

On the other hand, the function of the control and internal audit of the economic, financial and budgetary management, accounting, treasury, and collection assumes the accounting and fiscal control functions specified in detail in Law 55/1999, Royal Decree 2/2004, article 218 and Royal Decree 1174/1987, and the monitoring capacity of all budget areas.

Power given to the Personal eventual is conferred by the free appointment of a governing body to perform functions assigned by it. Without having to pass tests required of the rest of staff, they can assume leadership positions, receive support and protection from the political group that has appointed them and enjoy privileges of the civil service system while holding the position as nonpermanent staff.

Civil servants and permanent staff both provide professional services permanently and achieve their positions through various tests called "opposition" or "concurso-opposition" (Law 7/1985, article 91.2). Their ascription to scale and subscale (or group) has required the same degree; however, the civil servant in his or her career advancement can reach positions whose duties involve direct or indirect participation in the exercise of public powers or safeguarding the general interests; in addition, they are reserved for functions involving the exercise of authority (Law 7/1985, article. 92.3). The regulations establish, in advance, an inequality and power imbalance between the workers on the same hierarchical level.

### Control, Supervision, and Disciplinary Possibilities

**Governing body**: The Mayor is the highest representative in this body and exercises control, supervision, and discipline. It should be highlighted that the legislation provides him or her power over all staff, except qualified civil servants. The Mayor is the highest management over all employees, and has the capacity to impose penalties, including dismissal, for instance, through a disciplinary penalty for a grave offence. Permanent staff may be dismissed without the need of disciplinary penalty. Law 3/2012 has increased this lack of equity. The Governing Body is a continuation of mayoral powers because the Mayor presides over it and selects its members.

The control over the Mayor and other governing bodies is exercised by monitoring political groups in opposition, through the Plenary and Commissions (Law 7/1985, article 126.3 and Royal Decree 2568/1986, article 42).

**Workers**: All those at the higher level exercise control, audit, and discipline over those at the lower level based on hierarchical supremacy established in the legislation. Those at the lower level must obey instructions and service orders from their superiors, and incur disciplinary measures for noncompliance (Law 30/1992, article 55 and Law 7/2007, article 37.2 Estatuto Básico del Empleado Público). Maximum control and discipline are exercised by qualified civil servants at the head of their administrative Units, or the Head of Service. They monitor, oversee, and make decisions both over the government bodies and over the management of the City Council as an entity. The potential of disciplinary power over the rest of human resources is based on the ability to influence governing and executive bodies, together with the independent membership scales at the highest hierarchical level. According to the regulations, there is not any organ of the City Councils that can control or supervise qualified civil servants and face disciplinary action because of serious or heavy offence, which would mean removal from their position.

### Independence

The most independence and autonomy within human resources belongs to the local Administration civil servants with a national qualification. This ensures proper auditing over the

management of the government bodies and managers (Law 27/2013, Law 7/2007, Royal Decree 781/1986, Royal Decree 2568/1986).

Government bodies of the City Councils depend on each other. Although the main representative is the Mayor, the Plenary Session oversees its management policy. In addition, City Councils must provide the State Administrations and the Autonomous Communities (in the terms and form determined by regulation) with a copy or extract of their actions and agreements (Law 7/1985, article 56.1). It should be noted that the Mayor, City Councilors, local government body, and Plenary Management are supervised by qualified civil servants.

## Leadership

### Based on Ability, Training and Management Skills

The need for training and management skills to perform any form of formal leadership (for example, in company headquarters or on a board of directors) has not been found in any legislation or professional profile. Specifically, the legislation states that the necessary tests "will focus on the content of the functions and tasks legally assigned to the scale, subscale or class" (Royal Decree 896/1991, article 8.2). Scale, subscale, or class determines the hierarchical position and not a professional profile.

### Based on Hierarchical Position and Capacity to Inflict Punishment

The strong hierarchy in the organizational structure of the City Councils where the highest positions are occupied by governing (political) bodies and qualified civil servants has already been shown. At a civil servant level, we find paperwork and administration tasks characteristic of each hierarchical position, involving work of the "higher level" (Royal Decree 781/1986, article 169.1), down to the hierarchically inferior subscale of the junior worker. The highest hierarchical position of civil servants is conferred to the local administration scale for civil servants with national character qualifications. This shows the desire to regulate hierarchical relationships of one group over another. The capacity to inflict punishment appears in the legislation in several ways. The analyzed legislation establishes that public authorities will correct, in a disciplinary way, infractions committed by workers. It also shows the high penalty capacity held by the Mayor and other government bodies over all personnel except qualified civil servants. The legislation allows the Mayor to use different formulas to exercise his or her power and to impose penalties. One of these is expressly established by disciplinary proceedings, while another by distributing extra benefits not fixed or regulated – therefore allowing the Mayor to reward personnel who are more obedient, or who are related to him or her.

## Relationship Between City Councils and Prevention Legislation

The prevention framework that specifically affects people employed in City Councils has been investigated, taking into account protection under Occupational Prevention Risks (OPR), inspectorate supervision, and their capacity to penalize.

### Protection that Prevention Legislation Provides Civil Servants of the City Councils

All rules of OPR include the need to integrate prevention into the general management system of the company, including both the set of activities and all hierarchical levels. This would allow control of risks, the effectiveness of preventive measures and the detection of deficiencies that lead to new risks (Royal Decree 39/1997, Law 54/2003, and Law 31/1995 on Occupational Prevention Risks). Although this is established by law, actions to enforce this necessity are not in the regulations affecting the City Councils, nor is the obligation to establish them in their rules of procedure.

### Inspectorate's Supervision and Its Capacity to Penalize

Activities for the inspectorate's supervision and the capacity to penalize are regulated by Law

31/1995, Law 42/1997, and Royal Decree 707/2002. However, the capacity to penalize is restricted only to private companies. In this case, the labor inspector begins an infringement procedure to a private company (for example, for breaking a definite requirement). It is established that for City Councils (as for all levels of government), the inspector will submit procedure to the relevant bodies of the City Councils, ending the process (Royal Decree 707/2002, disposición adicional segunda).

### Supervision and Control of City Councils

The State Administration has the power to exercise control, audit, and discipline over City Councils.

#### Areas Where Supervision is Established

Monitoring and control in budgetary matters are established, but only through results of the full accounting of revenue and expenditure, and general guidelines that justify those numbers (Law 27/2013 and Law 7/1985). There is no control over other elements, such as the causes of these financial results. There is no mention of the need for evaluation of human capital (for example, sick leave and absenteeism) in relation to productivity and economic efficiency.

#### Background Factors of Work Harassment or General Psychosocial Risks

There is no control or supervision over organizational factors studied here, or work harassment, or general psychosocial risks. This absence is striking, especially when it is compared with the supervision and control of a financial nature. The Organic Law 2/2012, which concerns budgetary stability and financial sustainability, establishes preventive, corrective, and coercive measures to ensure such control to local corporations. To ensure compliance, the law establishes the possibility of imposing measures that can be enforced or provides, where appropriate, dissolution of the local corporation.

## Conclusion

The analysis of the legislation reveals multiple elements that enable abuse of power, which can be summarized in the following types:

(a) Inequality resulting from power imbalance (even among groups of workers with identical training and academic qualifications), which is not justified by benefits for human resources, productivity, or service to citizens
(b) Elements that from a legal position are subject to free will, away from justice and equity
(c) Power of any superior body to require obedience to any lower body and the obligation to obey it, endorsed by a disciplinary penalty system without good management or concerns for public health (or both)
(d) Lack of any rules for working relationships or responsibilities in the workplace (which may prevent abuse of power); there are therefore no consequences for inadequate management

The profile with the greatest power among the government body is the Mayor, although the Plenary Session and the qualified civil servants can develop control over the governing body. The qualified civil servants, although they have no public visibility, they have strong powers of supervision and control over the entire City Council (including the Mayor).

Leadership in the legislation based on hierarchical supremacy and the possibilities of inflicting punishment. Moreover, a so-called laissez-faire management is allowed. This is because governing and managing bodies have no established penalties if they do not perform their functions correctly; only disobedience is punished. This is despite the fact that scientific research establishes that the type of leadership that prevents work harassment and other psychosocial risks is based on ability and training.

Supervision and control over potential psychosocial risks specifically regarding work harassment expected from the Labor Inspection and Social Security departments are constrained to

the City Councils. Despite having the power to penalize very serious offences concerning a private company, the Inspectorate has no such power when it comes to such public entities.

Profiles of power with multiple possibilities to exercise it abusively, therefore, are reinforced by the establishment of different types of leadership. These are classified as promoters of harassment, consolidated by the inability of the Labor Inspection to penalize the City Councils in the area of psychosocial risks (and specifically work harassment), along with a lack of external supervision of the City Councils. These factors consequently distance the entity from a model of preventive management and bring it ever nearer to being an organizational archetype that increases the probability of work harassment.

# Bureaucracy and Administrative Culture in Bangladesh

Rafiqul Islam
Department of Peace and Conflict Studies, University of Dhaka, Dhaka, Bangladesh

## Synonyms

**Bureaucracy**: Public servants; Civil bureaucracy; Civil servants; Government officials; Public bureaucracy

**Administrative Culture**: Administrative ethos; Administrative practice; Administrative system; Bureaucratic culture

## Definition

Bureaucracy: Bureaucracy can be defined as a body of nonelective government officials or administrative policy-making group characterized by specialization of functions, adherence to fixed rules, hierarchy of authority, and impartiality.

Administrative Culture: Administrative culture can be defined as shared norms, values, attitudes, perceptions, interpretations, and behavior of public bureaucrats or government officials that influence their interpersonal relationships between themselves and other members of the society.

## Introduction

Culture is defined as "norms, attitudes, values, perceptions, interpretation and behavior of an individual" (Almond and Verba 1965). Culture is social values or norms based on which people believe what is good or bad, right or wrong, and just or unjust. The culture of a given organization is molded by the legal, social, and economic frameworks within which it is ingrained. The culture of a given organization within a single political system is influenced by such variables as its history, mission, and services it provides and the employees' personalities. Culture is also a dynamic property or shared values that shift over time, although the change can be either swift or slow depending upon the form or type of organizations (Schachter 2002). In the context of an organization, culture helps explain organization events and human behavior. In organization, culture integrates members of organization by creating loyalty, identity, and belongingness. Culture can also be defined as "what organization is and what organization has" (Jamil 2007; Pettigrew 1979).

Administrative culture, according to Peters and Waterman (1982, p. 103), is defined as "a dominant and coherent set of shared values conveyed by such symbolic means as stories, myths, legends, anecdotes and fairy tales" (1982, p. 103). Deal and Kennedy (2000) define administrative culture as "the way we do things around here" (p. 4). This definition purports that a given organization's shared values have a history and this history legitimates their present and future maintenance (Schachter 2002). Administrative culture embraces values, norms, beliefs, and attitudes concerning administrative action and behavior. Since administration is culture-bound, administrative culture involves the mode and style of functioning of officials. As culture develops specific features in different environments, administrative culture is shaped by the setting or the environment in which it operates (Almond and Verba 1965). Administrative culture is influenced by political, economic, and sociocultural environments, and these environments are also influenced by administration. Administrative culture is also defined as beliefs and values that influence bureaucrats' interpersonal relationships and their responsiveness to society (Jamil 2007). As culture is changing over time, administrative culture is not static; it is dynamic.

Although bureaucracy can be defined from different perspectives, the common understanding of bureaucracy centers around public servants or government officials. Bureaucracy in a developing country like Bangladesh holds huge power, because it handles a variety of societal issues and problems. Public bureaucracy is the key actor of administrative culture. Because of its all pervasive

powers, bureaucracy has been a victim of administrative ills, including unresponsiveness, red tape, self-perpetuating, self-aggrandizement, corruption, lack of neutrality, departmentalism or empire building, and status quo.

The purpose of this entry is to analyze public bureaucracy and administrative culture in Bangladesh. This entry is divided into two main sections. The first section provides a historical background of the bureaucratic and public administrative systems that existed before the independence of Bangladesh, with particular emphasis on the civil service systems and administrative practices during the British and the Pakistani periods, followed by a brief discussion on the civil service in Bangladesh. The second section examines the common features of administrative culture in Bangladesh.

## Bureaucracy and Administrative System Under the British Rule

Although the Mughal ruled Bangladesh for several centuries, the basic structure of public administration and bureaucracy in Bangladesh was established during the British colonial periods for nearly two centuries (Zafarullah and Huque 2001, p. 1382). The administrative machineries under the British rule went through a series of reforms and reorganizations. At the initial stage of the British rule in India the scope of public administration was very limited. The scope of public administration during the British rule was mainly confined to collection of taxes, maintenance of rule of law, and dispensation of justice. The British colonial rule was established in the subcontinent since 1757 through the defeat of the last independent ruler of Bengal, Nabab Siraj Uddoula to the East India Company.

During 190 years of British rule in Indian subcontinent numerous reform initiatives were undertaken by the British rulers to make an effective administrative system and institutional setup. While the British colonial rulers brought about structural changes of bureaucracy in Britain, they retained the elitist and centralized administrative machinery in India. The British colonial administrative machinery, known as the Indian Civil Service (ICS), was completely alienated from the common masses. The members of the Indian Civil Service (ICS), who were educated in Britain, in fact, sustained the British colonial norms and values. The ICS officers were even trained to keep them alienated from the general masses. In fact, the British colonial rulers used the elitist and centralized bureaucratic machinery as an instrument of repression and control of the Indian native population in order to strengthen the foundation of imperial domination (Khan 1994, p. 146). Even after Indianization of British Indian Civil Service, the elitist behavior of the ICS officers remained the same that helped sustain the colonial rule. Moreover, the entry into the ICS during the colonial rule was extremely limited, and only highly educated people among the affluent Indians could qualify for entering the civil service career (Zafarullah and Huque 2001, p. 1382).

The bureaucracy under the British imperial rule became so segregated and privileged segment in the society and was so submissive and loyal to the colonial rule in safeguarding the imperial interests of the colonial masters that common masses experienced excessive difficulties in communicating with the bureaucrats and in receiving government services. However, even after independence of India from the British, the elitist and centralized administrative system was still very strong within the newly named Indian Administrative Service (IAS) (Zafarullah and Huque 2001). Secretariat was the nerve center of colonial administration located at both the center and provinces, while the miniature prototype of colonial administration was located at the district levels.

## Bureaucracy and Administrative System During the Pakistani Rule

After the partition of Pakistan from British India in 1947, Pakistan inherited an overdeveloped state apparatus, and the administrative elites. These administrative elites of Pakistan who were the "linear descendants" of the British colonial administrators also inherited the attitudes and orientations of their predecessors (Ahmed 1981, p. 37). As the successor of the British colonial bureaucracy, and being recruited and trained in the

same tradition and working within the institutional framework, the administrative elites in Pakistan were able to retain their elitist nature and became the most dominant social sector in Pakistan, or even more dominant than their British colonial masters. The framework of public bureaucracy in Pakistan was also developed during the colonial period, and little structural changes were made within the public bureaucracy (Ahmed 1981, p. 38).

### Bureaucracy and Administrative System in Bangladesh

The present bureaucracy in Bangladesh is a by-product of British colonial administration, which has centralized, elitist, nonparticipative, and undemocratic characters (See Khan 1991; Ahmed 1981). Although Bangladesh adopted the parliamentary democracy in 1972 after independence from Pakistan in 1971 to guarantee human rights and political freedom of citizens, the democratic politics was thwarted several times in the history of Bangladeshi politics. Numerous factors can be identified as the causes for the dwindling democracy and underdevelopment in Bangladesh. Among different factors responsible for obstructing the promotion of democracy and development in Bangladesh, military intervention, bureaucratic intransigence, elitist and centralized administration, widespread corruption in administration, and lack of commitment and political integrity, as well as noncooperation among the ruling party and the opposition political parties are highly remarkable.

Volatile and unstable political conditions, economic depression, illiteracy, poverty, unemployment, hunger, and malnutrition of poor people are the common phenomena in Bangladesh in which social services are extremely limited. Inefficiency in bureaucracy, nepotism and favoritism, political interference in public administration and management, and infringement of the rule of law and fundamental rights are also rampant in Bangladesh (Zafarullah and Huque 2001). Bangladesh has suffered from political instability since its independence, and the economic mismanagement has seriously marred the potential for development.

## Features of Administrative Culture in Bangladesh

Administrative culture in Bangladesh is very much influenced by its socioeconomic and political environments as well as historical perspectives. Jamil (2007) in his study has explained administrative culture in Bangladesh in terms of bureaucrats' interpersonal relationships and their social and political responsiveness. However, the major characteristics of administrative culture in Bangladesh identified by Jamil (2007) are briefly discussed as follows:

### Power and Authority Relationship

Bangladesh is characterized as hierarchical society in which interpersonal relationships are based on position, status, seniority, and gender, and the relationship between senior and junior is referred to as "patron-client" relationship or mostly hierarchical ones. In civil service, seniors give orders and juniors are expected to carry out orders. While personal paternal relationships are mostly confined within services, inter-service relationships are characterized by rivalry, factionalism, and lack of coordination (Jamil 2007).

### Trust

In Bangladesh, trust is mostly confined within family. In the civil service, low levels of interpersonal trust often impede cooperation and institutional growth. Trust is not only low across services, but within a service trust is also confined to a few. Low interpersonal trust in the bureaucracy in Bangladesh is an upshot of colonial legacy, which leads to centralization of authority.

### Commitment to Organization

In the civil service in Bangladesh, loyalty of civil servants is mostly cadre based rather than organization based. The bureaucrats are also loyal to their families and relatives. Although junior civil servants are very often rotated between central and local levels of positions and senior civil servants often move from one ministry to another ministry, the bureaucrats are often more committed to their cadres than the attainment of organizational goals. This is because of a centralized

recruitment system which recruits civil servants to functional services; a civil servant's career is organized within the service once he or she is recruited to a particular service.

### Autonomy

Although literally the civil servants of Bangladesh are recruited by an autonomous recruitment agency of the government called the Public Service Commission (PSC), the autonomy and neutrality of the PSC is tarnished because of political interference. Bureaucrats in Bangladesh are viewed as less autonomous and unaccountable. Civil service jobs in Bangladesh have lost past glory, prestige, and honor due to political interference, low salaries, and position benefits.

### Political Responsiveness

Due to absence of consistent policy formulation and policy adoption, bureaucracy in Bangladesh becomes rule oriented. As unclear national goals shift with changes in government, civil servants in Bangladesh often become uncertain. Because of political parties' failure to reach political consensus on national issues and insufficient institutional measures to hold bureaucracies accountable, the civil servants of Bangladesh often remain unresponsive and unaccountable to political decision makers.

### Societal Responsiveness

According to Jamil, the social responsiveness of bureaucrats in Bangladesh is more directed towards the higher levels of people in the society. In Bangladesh, due to the elitist behavior and attitudes, the civil servants become alienated from the common people. In Bangladesh society, hierarchy dominates interpersonal relations and governance is not based on responding to citizen's demands; bureaucratic actions often favor the elites with whom the bureaucrats share economic, social, and academic backgrounds. The increasing dissatisfaction of donors with bureaucracy is characterized by a low level of sensitivity to local needs and problems (Jamil 2007).

Anisuzzaman (1985) has identified some features of bureaucratic culture in Bangladesh, such as tadbir-based administration, regionalism or districtism, lack of integrity, and mystic of service. Tadbir is used as an administrative jargon in Bangladesh, which often means to make special effort to get the thing done if it does not operate automatically without any effort or persuasion. It has been a tradition in public organizations in Bangladesh that a file does not move normally from one table to another table without any special effort by people (Anisuzzaman 1985).

Regionalism or districtism is meant to place overemphasis on district-based quota system in the recruitment and promotion of civil servants in Bangladesh. Regionalism or districism is a hindrance to promotion of equity and social justice in civil service of Bangladesh, because it hampers merit system as it fails to recruit and promote the best qualified and most talented persons in civil service (Siddiquee 2003). Furthermore, the civil servants often have a tendency to avoid democratic responsibility to provide better and satisfactory services to the citizens due to ambiguity of rules. Civil servants are always reluctant to use their discretion in rational manner in order to solve the problems created by the ambiguous procedures or rules, which Professor Anisuzzaman called mystic of rule (Anisuzzaman 1985).

Apart from the above-mentioned characteristics of administrative culture in Bangladesh, an analysis of the bureaucratic features and practices will help understand the nature and characteristics of administrative culture in Bangladesh. In this regard, in the section that follows, I will critically examine some factors that help understand the nature and characteristics of the bureaucracy and administrative culture in a developing country like Bangladesh.

## The Elitist and Authoritative Characters of Civil Servants

The elitist or authoritative character of the civil servants of Bangladesh is not a new phenomenon. The Bangladeshi civil servants inherited the elitist and authoritative characters both from the British Indian civil service and the Pakistani civil service. However, in an interview of the senior civil servants of Bangladesh in 1976, about 60% of the civil servants replied that since the civil servants

were highly qualified and the guardian of the public, they were expected to formulate and implement policies and the responsibility of the common masses should be only to obey the law and order and to work hard, not to participate in any policy issues or developmental activities. In terms of the nature of the government, the majority of the civil servants opined that the government would be authoritarian than democratic. To them, Bangladesh needed a sort of benevolent dictatorship. The bureaucrats also expressed that the developmental activities would be highly centralized, and guided by a central agency (Ahmed 1980, pp. 167–174; 1981, pp. 81–89).

It is mentionable that both the civil and military bureaucrats of the British India and United Pakistan came from upper classes who were accustomed to Western style of social graces, dresses, and manner. Although the family backgrounds of most of the Bangladeshi civil servants are not as high as those civil servants of British India and United Pakistan, they belong to the upper and/or upper-middle classes in Bangladesh. Moreover, the civil servants of Bangladesh are also highly educated compared to the general public who play an important role in policy making and national development. Because of their high social status and expert power as well as widespread stronghold in all spheres of governmental activities the public bureaucrats or civil servants hold elitist character and view them as masters or guardians of the common masses rather than viewing themselves as servants of the state or citizenry.

### Change Versus Status Quo

Like the bureaucrats in many developing countries, the civil servants of Bangladesh are often viewed as parochial and resistance to any change or development who always try to maintain the status quo. Because an examination of the role of bureaucracy in administrative reforms of different regimes of Bangladesh reveals that the civil servants, especially the generalist civil servants of administration cadre, always tried to maintain their status quo and resisted the implementation of the recommendations of the reform/reorganization committees/commissions that went against their class interests. Although devolution of power and authority to local levels of government is essential to make administration democratic (Zafarullah and Huque 2001), the civil servants of Bangladesh were never interested in delegating administrative power and responsibility to the local levels of administration.

The Ahmed study revealed that when asked whether the civil servants advocate any change in the existing bureaucratic institutions for either promoting economic development or for distributing the benefits of economic growth, about four-fifths of the civil servants replied that were not impediments to either. They also contended that the existing bureaucratic institutions were not retarding the process. It was also revealed that although the scope of developmental activities widened to a greater extent, the nature of basic administrative duties, such as the maintenance of law and order, did not change so much (Ahmed 1980).

### Bureaucratic Corruption

Although administrative corruption prevails in many developed countries, the extent and magnitude of administrative corruption is more widespread in the Third World countries. In Bangladesh, administrative corruption takes place in several ways: (1) due to high levels of bureaucratic discretion, (2) public sector monopoly in commercial activities, (3) lack of strong mechanism for ensuring accountability, (4) low civil service salaries, (5) ambiguous regulatory measures, and (6) inadequate access to government information (World Bank 1996).

A survey conducted by Transparency International Bangladesh (TIB 1997) identified police stations (thana), lower judicial courts, public hospitals, sub-registrar's office, land record office, tahshil's office, and scheduled banks as most corrupt offices in Bangladesh. The study also revealed that the absence of accountability and misuse of position and powers appeared as the most salient features of corruption (TIB 1997). A study by TIB between January 2000 and June 2000 revealed that of 927 corruption cases, the highest number of corruption indicated were

reported in the law enforcement (Police, BDR, Ansar, etc.) agency (30%) followed by local government agency (17%), while the lowest incidents of corruption took place in transportation sector (2%). Moreover, the different types of corruption as identified by the TIB in public sector in 2000 included misuse of power, bribe taking, embezzlement and extortion, misuse of resources, and negligence of duty (TIB 2000).

### Factionalism and Fragmentation

Factionalism in the civil service of Bangladesh is a hindrance to democratization of administration, as it has slowed down the pace of development in Bangladesh since Bangladesh's independence. The democratization process of the civil service in Bangladesh has been hindered by the ever-existing inter-cadre and intra-cadre competition among the public servants for attaining personal benefits and opportunities (Mamoon and Ray 1987). Different factions in the civil service of Bangladesh which emerged after independence of Bangladesh were because of political patronage or participation in the war of liberation or even due to group interests of the civil servants (Zafarullah 1987). For instance, "Freedom fighters vs. collaborators" and "CSP vs. EPCS" were among different factions that caused conflicts and tensions in the civil service during the Mujib regime (Mamoon and Ray 1987).

While factionalism was a common phenomenon in Bangladeshi civil service during the Mujib regime, interest group conflicts such as "generalist-specialist" or "professional-technician" conflicts were more pervasive in the civil service during the Zia regime (Zafarullah 1987, pp. 470–471). However, the antagonism and conflict between the generalist and the specialist civil servants have also eroded the integrity and morale, coordination of civil servants during the successive regimes of General Ershad, Khaleda Zia, and Sheikh Hasina. In fact, over time, it has been observed that the civil servants do not even hesitate to call strikes, restrain from work, or to organize meetings and demonstrations by one group against another to protect their own group interests (For instance, see Khan 1991, p. 90).

### Lack of Administrative Accountability

Accountability is a significant component of sound and seamless administration in a democratic system of governance. Democracy creates a favorable condition for ensuring accountability of both the bureaucrats and politicians where the people have legal right to exercise control, directly or indirectly, over the administrators and politicians (Ahmed et al. 1992, pp. 389–407). While in a democracy the politicians or the elected members of a legislature are accountable to the people, the bureaucrats are supposed to be accountable to political leaders. The Mujib regime after coming to power was trying to make bureaucracy accountable to the politicians. But the politicians including the cabinet members of the Mujib government were corrupt. Mujib himself suffocated democracy by introducing authoritarian single party system by banning multi-party system in January 1975. Besides, due to famine, economic depression, and political instability Mujib's regime failed to develop a strong political institution for making bureaucracy accountable and responsible to political leadership. In fact, due to lack of political commitment and consensus among political parties and other socioeconomic and political realities, the successive governments of Bangladesh have failed to ensure administrative accountability in Bangladesh.

### Inefficiency-Underperformance Conundrum

Although the civil servants of Bangladesh are much more educated than the average population, many civil servants are blamed as less efficient and underperformed. This is because the training programs provided by the training institutions to the civil servants are mainly archaic and theoretical in nature, which are devoid of practical problem-solving strategies-lacking notion of the reality. Another way of envisioning the "inefficiency-underperformance" conundrums in Bangladeshi civil service is the over emphasis of seniority than merit in promotion system (Siddiquee 2003). In fact, one major reason of less efficiency and underperformance tendency among the public officials may be identified as improper strategy of assessing the performance of the civil servants of Bangladesh. The Annual

Confidential Report (ACR) used to assess the performance of the civil servants is also viewed as defective, which might be a main reason for 'inefficiency-underperformance' dilemmas in civil service of Bangladesh.

### Centralization of Administration

Like most of the developing countries, the patterns of bureaucratic system and/or administration in Bangladesh are still centralized. Indeed, holding the elitist character and mentality, the bureaucrats in Bangladesh are often reluctant to delegate administrative power and authority to local level of administration. Bureaucrats also believe that the process of development needs to be a highly centralized process, guided by a central agency, and all the state machineries should be maneuvered to make the development process a success by motivating the general public from below. The study by Ahmed (1980) also demonstrates that the civil servants of Bangladesh believe that all the developmental activities of the government will be controlled by central agencies. In fact, the centralized behaviors and mentalities of the civil servants have been developed by the authoritarian political decisions of the governments in Bangladesh. In Bangladesh, under both parliamentary and presidential forms government, major political decisions have been concentrated in one person – either in the hands of Prime Minister or President who maintained a strong secretariat to control the entire administrative structure (Zafarullah and Khan 2005). Not only during the Mujib regime, active participation of people and lower level public employees in nation-building activities have been hindered under the centralized administration of most of the successive governments of Bangladesh (Zafarullah and Khan 2005).

## Conclusion

Since Bangladesh was ruled by the British Empire, it inherited a British colonial bureaucracy and administration. Public bureaucracy in Bangladesh is viewed as parochial, elitist, authoritarian, hierarchical, centralized, excessive rule bound, inefficient, unaccountable, and unresponsive. Administrative culture in Bangladesh is best understood in terms of bureaucrats' interpersonal relationships and their social and political responsiveness. In Bangladesh, bureaucrats' personal paternal relationships are mostly confined within services, and inter-service relationships are characterized by rivalry, factionalism, and lack of coordination. Inter-service trust is not only low across services but within a service trust is also confined to a few. In fact, low interpersonal trust in the bureaucracy in Bangladesh is an outcome of colonial legacy, which leads to centralization of authority.

In the civil service in Bangladesh, civil servants are mostly loyal and committed to their cadres, families, and relatives rather than the attainment of organizational goals. Bureaucrats in Bangladesh are viewed as less autonomous and civil service jobs in Bangladesh have lost past glory, prestige, and honor because of political interference, low salaries, and position benefits. Furthermore, because of lack of political consensus by political parties on national issues and insufficient institutional measures to hold bureaucracies accountable, the civil servants of Bangladesh often remain unresponsive and unaccountable to political decision makers.

In terms of social responsiveness, bureaucrats are more responsive to the higher levels of people in the society, which is why international agencies choose NGOs over civil servants to provide financial assistance for implementation of developmental goals. In Bangladesh, due to the elitist behavior and attitudes, the civil servants become alienated from the common people. Some other features of bureaucratic culture in Bangladesh include tadbir-based administration, regionalism or districtism, lack of integrity, and mystic of service. Other factors influencing administrative culture in Bangladesh entail maintenance of status quo, anti-developmental, administrative corruption, and inefficiency-underperformance dilemma.

# Bureaucracy and Capitalism

Dragan Stanisevski
Department of Political Science and Public Administration, Mississippi State University, Mississippi State, MS, USA

## Synonyms

Bureaucracy – formalization; Bureaucracy – hierarchy; Bureaucracy – power; Capital – hierarchy; Capital – power

## Introduction

Regrettably, when speaking of capitalism as the dominant social and economic system frequently enough, the discussions by both the proponents and the opponents remain at the level of ideology. In the memorable words of John Kenneth Galbraith (1998, p. 6), our asserted understandings of capitalism, and its alternatives, often become forms of "conventional wisdom," a situation where concepts that have entered the social mainstream have become so commonly (mis)used that they continue being accepted because of their popularity rather than the veracity of the original ideas behind them, which are often forgotten. Labels are commonly attached, but not always are the meanings of the concepts, as well as their historical underpinnings, carefully reviewed on their own terms. This chapter attempts to provide a basic clarification in the process of which it aims

Definitions of core ideas in the Synonyms section are provided in text and are italicized

to integrate some of the main literature on this expansive subject and to logically demonstrate that capitalism and bureaucracy express the power of hierarchy that tends to permeate the modern society.

To start with, the chapter briefly outlines the three foundational concepts necessary in any understanding of capitalism: land, capital, and labor. These are the *major inputs in any productive process*, elaborated extensively in the economic literature (Piketty 2014), and are thus jointly known as *the factors of production* (Smith 1966; Marx 2007). "Entrepreneurial talent," is sometimes added to this trio of major factors of production (Galbraith 1967, p. 46), but this chapter retains the classical three factors with an explanation that entrepreneurship could be a feature of either labor or capital (Piketty 2014, p. 204).

For much of the premodern history, land was the main factor of production (Galbraith 1967, p. 51). The reason is rather simple. In conditions of a relatively low technological advancement in agricultural production, it took large swathes of land to feed the population. Since the available land was limited, the growth of population was quite limited as well (Ricardo 2004, p. 105; see also Maddison 2007, p. 376; Piketty 2014, p. 79). Of course, conquests of land became a major preoccupation of aspiring hegemons because more land meant more power and wealth, but in aggregate, and for the most part, there was a scarce amount of land available. If one applies the basic principles of supply and demand, all other things equal; if the supply is limited and the demand is high, the socioeconomic value of something is likely to be high as well (Galbraith 1967, pp. 51–53).

These economic conditions paved the way for a feudal patrimonial society, a "society of rentiers" (Piketty 2014, p. 264), where ownership of land and its resources gave massive privileges (Smith 1966, pp. 407–419). Although the discovery of the "New World," particularly the Americas, temporarily reduced the scarcity of land, what really changed the dynamics of social and economic production was a technological revolution (Galbraith 1967, pp. 50–56). This technological revolution took place not only in the sphere of industrial production but also in agriculture henceforth reducing the strategic importance of land as a factor of production (Stanisevski and Shoup 2014).

## Capitalism and Free Markets

Although all three of the factors of production were always vital, and land and its resources remain crucial even today (Piketty 2014), modern society is typified by a struggle for dominance between the labor and the owners of capital (Marx 2007, 2008). According to Marx (2008, p. 115) labor is "*. . . a process in which both man and Nature participate, and in which man of his own accord starts, regulates, and controls the material re-actions between himself and Nature* [emphasis added]". Obviously, the term *capitalism* itself implies that the capital is the essential aspect of modern economic production. Still, the interdependent relationship between the factors of production is much more complex. Generally, the proponents of capitalism as free markets believe that the relationship between capital and labor is naturally more horizontal, with capital serving as a reward for labor (Smith 1966; Friedman 1982), while the opponents contend that capital, once sufficiently concentrated, becomes a form of exploitation of labor (Marx 2007, 2008).

It is important not to be too harsh on Adam Smith (1966) as one of the founding fathers of modern political economy. Notwithstanding the more contemporary free-market thinkers (Friedman 1982, p. 133), among his admirers Adam Smith could also count on none other than Karl Marx (2007) himself (see also Galbraith 1998, p. 23). Marx's (2007, pp. 36–37) unpublished manuscripts and notes show that in developing his theory of capital as exploitation of surplus value of labor, among others, he heavily built upon the works of Smith (1966), Say (1821), and Ricardo (2004), the classical liberal thinkers. Marx (2007, p. 37) even derives his definition of *capital* as "*stored-up labour* [labor] [emphasis in original]" from Smith's (1966, p. 354) expression (see also in

Say 1821; Mill 1844; Ricardo 2004). Such diversity of admiration speaks loudly of the seminal nature of Smith's work. Adam Smith, nevertheless, lived in a very different world. His world was a world of small butchers and bakers, a world where a pin factory was a major advance in industrial production (Smith 1966, pp. 2–3, p. 13; see Galbraith 1967, p. 47).

Smith (1966, pp. 14–16) indeed had a very humanistic belief in equal talents of all individuals. Keeping his idealistic humanism in mind, it is perhaps understandable that Smith (1966, p. 16) believed that the free market represents a place that joins all the "dissimilar geniuses," resulting with a situation "...where every man may purchase whatever part of the produce of other men's talents he has occasion for." Instead of everyone attempting to be the proverbial "jack of all trades," people would more narrowly focus their diverse talents and exchange the produced goods resulting from their labor. Furthermore, Smith (1966, pp. 111–161) was not oblivious to the inequality of wages and profits, but maintained that "revolutions in public welfare" could not, in the long-term, alter the overall differentiated distribution of incomes, which is regulated through market competition and hence natural and relatively stable over time.

The key word in here, however, is *competition*, which assumes relatively equal power positions of contributors in the process of production. Given that Smith (1966, pp. 14–15, p. 361) maintained that people have equal talents, just different proclivities; proclivities that are often influenced by the society, so then it is not unreasonable for him to assume that the "accumulation of capital" at the end would be a result of "parsimony" and the lack of capital a result of "prodigality and misconduct".

More contemporary advocates of capitalism as free markets frequently tap into this assertion with an argument that violations of the competitive structure of the free market, such as monopolies, are aberrations emerging from nonmarket-related influences (Friedman 1982; Olson 2000). Friedman (1982, pp. 128–132), for instance, argues that there are three major sources of monopolies: (1) technical considerations, (2) direct and indirect government assistance, and (3) private collusion. Notice that these are all external influences. The appropriate role for the government is primarily to enact antitrust laws and maintain free competition in the market (Friedman 1982, pp. 132–133).

## The Power of Hierarchy

What is frequently disregarded by those who equate capitalism and freedom, like Friedman (1982) for example, is that the emergence of corporate monopolies and oligopolies, and hence a diminution of free markets, could be due to the very logic of accumulation of capital. Or to put it more bluntly, it takes capital to make capital. For Marx (2007, p. 21) it is precisely the separation of the factors of the production that is "fatal for the worker." Since workers are many and largely disorganized, in the absence of effective labor unions, and capitalists are few and can more easily combine their efforts, the worker is inevitably in a disadvantaged position. The principles of supply and demand continue to be relevant. As Galbraith (1967, p. 56) puts it: "Power goes to the factor which is hardest to obtain or hardest to replace." Galbraith here implicitly draws on Marx's (2008, p. 361, emphasis in original) "*absolute general law of capitalist accumulation*" according to which there is an inverse relationship between the "industrial reserve army," the size of available labor force, and the economic conditions of the labor force. If an industrialist can easily replace a worker with another, the bargaining power of that worker is very low. In addition, capitalists already have stored value in form of capital that they can tap into, while workers are dependent on wages for bare survival (Marx 2007, p. 20). Far from all the players in the market being free and equal, the workers as the suppliers of the labor are likely to be in a very precarious situation (Galbraith 1967, pp. 54–56).

What is there to prevent such a dystopian scenario and to maintain the capitalist market free and fair? According to Marx (2007, pp. 41–42), the "...sole defence [defense] against the capitalists is *competition*... [emphasis in the original]," but this defense inevitably fails because it necessitates

a multilateral accumulation of capital, relatively horizontal accumulation of capital, which is an unrealistic assumption given that the large capital naturally accumulates more quickly, thus leading to large discrepancies and ultimately to unilateral accumulation of capital, a skewed and more vertical accumulation of capital. It is a very plain logic comprehensible to a regular person, a logic that Marx (2007, p. 41) again bases on Smith's (1966, p. 109) insights; it is the power of compound interest that expands the profits of capitalists exponentially, while the wages of the workers only grow linearly, if at all.

Contemporary historical studies of patterns of accumulation of capital tend to corroborate Marx's (2007) expectations (Piketty 2014). In his seminal study, Piketty (2014), for example, clearly demonstrates that in absence of specific government policies for regulating capital and redistributing wealth, either directly or indirectly, capital accumulation remains painfully limited to the few in the very top income brackets. And the accumulation of income from capital is also consistently more inequitable than that of labor (Piketty 2014, pp. 237–270). To the extent that there has been a shift in the composition of total income from capital to labor, it could be seen particularly in the emergence of the so-called "supersalaries" of the top private and public sector managers, a movement which signifies a shift from a "society of rentiers" to a "society of managers" (Piketty 2014, pp. 276–278, pp. 298–300).

The shift from a "society of rentiers" to a "society of managers" that Piketty (2014, pp. 276–278) identifies in the historical data was recognized theoretically early on by Galbraith (1967, pp. 60–71) as the emergence of "the new industrial state," which is dominated by "the Technostructure." This shift to technocratic oligarchy is a tectonic change from the times of Adam Smith (1966) and even Karl Marx (2007). In early modern times, the ownership of capital was still closely related with a particular entrepreneur that took personal risks in employing capital. In "the new industrial state," which Galbraith (1967, pp. 70–71) considers as the core structure of the late modern society, the management of a company is dominated by a collective of corporate managers. These corporate managers, although they might have certain personal stake in the company, tend to be much less invested in the future of the company than an entrepreneurial owner would be. Witness, for example, the massive changes in the financial sector from the days of limited partnerships to the contemporary corporate conglomerates (Lewis 1989).

At this point, it is important to make a slight digression in order to clarify the concepts used. What Marx (2007) and Galbraith (1967) theoretical elaborated, and Piketty (2014) empirically observed, is that the accumulation of capital is clearly *hierarchical* in nature, which is to say it is *vertically organized and distributed*, and hence it also gives rise to hierarchical social structures (for an anthropological discussion see Graeber 2012). Not all hierarchical structures, however, are the same. A "society of rentiers" is also hierarchical, but it has a different character from a "society of managers" (Piketty 2014, pp. 276–278). There is a different dynamic in play that perhaps Marx (2007) himself could not have foreseen in the nineteenth century.

First, what Marx (2007) did foresee is the intimate relationship between capital and *power*, *the ability to regulate and govern the social production relations* (Marx 2007, pp. 36–41; 2008, p. 465). Expanding beyond Smith (1966), Marx (2007, p. 36) explicitly argues: "Capital is thus the *governing power* over labour [labor] and its products [emphasis in the original]." Galbraith (1967) similarly argues that with accumulation of capital comes also accumulation of power. Capital not only creates more capital, but it also concentrates the power in the society and enables the maintenance of structured hierarchies that protect and perpetuate the accumulated capital of the oligarchic class (for an alternative view from a free-market perspective, consider Olson 2000). The owners of capital overtime though tend to become so dependent on the managerial technocrats that power starts to shift away from the actual owners of the capital and toward the corporate managers (Galbraith 1967, pp. 49–50).

The owners of capital become dependent on the managerial technocrats, as Marx (1970, p. 46) observed, because in order for the power of the

capital to be thoroughly routinized, the bureaucracies must formalize the established social production relations (see also Marx 2008, pp. 465–481). Ultimately extending to the state level, this process of bureaucratic *formalization* is a process of *regulation and transformation of the particular hierarchical relations of social production into a universal will of the state* (Marx 1970, pp. 41–54; 2008, pp. 465–481). In these respects the aims of the state bureaucracy and the "corporation" are not that different, they both aim to formalize and routinize the power of hierarchy in the society (Marx 1970, pp. 46–47, p. 54; but see Hegel 1967).

There is a development in the late modern society, however, that for Marx (2007), in the early industrial age, perhaps would have been hard-pressed to envision: capital itself has become very abundant, albeit still heavily and increasingly concentrated in the hands of few (Galbraith 1967, p. 56; Piketty 2014). In turn, the late modern society gradually becomes so complex that the management aspects are evermore delegated to organizations and the technocratic class that manages these organizations. For Galbraith (1967), what is now scarcer is technical knowledge that includes corporate and governmental management, while much of the unskilled labor becomes redundant (see Rifkin 1996, but also see Marx 1970, p. 47).

As Piketty (2014) evidenced and as Galbraith (1967, p. 58) expected, the position of the labor in general, nonmanagerial, non-technologically savvy labor at least, is therefore not much improved, and in some instances the position of the labor even deteriorates further. What emerges is a Platonic "new class" of technocrats that is increasingly fused with the owners of capital (Djilas 1957; Plato 2008; Stanisevski 2011). This bureaucratic class rather than remaining limited to "[t]he maintenance of the state's universal interest . . .," which in the case of the state bureaucracy Hegel (1967, p. 189) envisioned as its proper role, along the lines of what later became known as the politics-administration dichotomy (Wilson 1887), makes its own interest the universal interests (Marx 1970, p. 47). In Marx's (1970, p. 47) words: "The aims of the state are transformed into aims of bureaus, or the aims of bureaus into the aims of the state." In Galbraith's (1967, pp. 60–71, p. 314) rendition of "the new industrial state," the displacement of the universal interest with the particular interest of the "technostructure" to maintain the power of hierarchy is typical to the capitalist organization in general, public or private.

## Conclusion

To students of public administration, the epochal shift to a technocratic structure would be easily recognizable in Weber's (1946) discussions of bureaucratization of modern societies on both the corporate and governmental side (for a discussion of the relationship between capitalism and bureaucracy in Weber, see Stanisevski 2004). Galbraith's (1967) approach to the issue is distinctly more post-Marxist than Weberian, focusing more on the nexus between capital and power rather than the nature of rationality.

Public administration, nevertheless, has a particular position in the new "society of managers" (Piketty 2014, pp. 276–278). It is a paradoxical position of both instrumental power and social derision. On one side, as Weber (1946) clearly demonstrated, bureaucracies, including public bureaucracies, are indispensable in the day-to-day running of modern complex societies, which are increasingly more urbanized (see Smith 1966, pp. 420–432). Eventually, somebody has to build and maintain streets, utility systems, or collect the trash, and it is the government bureaucracy that is likely going to be the provider, if not the producer, of most of these services (Stanisevski 2004, 2011). Even Adam Smith (1778, p. 332) acknowledged that a capitalist society needs public institutions providing for common welfare such as public works.

On the other side, in a social and economic system that is still dominated by capital, albeit now fused with upper management, government bureaucracy is regularly suspect. From the earliest days of modern conceptualizations of public administration, government bureaucracy was perceived in a subservient, instrumental position

vis-à-vis the economic enterprises, the state, and the society at large (Hegel 1967; Wilson 1887). The infusion of market-based theories in the late 1970s further created an ideological impetus for a massive departure from the welfare state that was created after World War II in the Western societies (Niskanen 1971; for a critique see Wamsley et al. 1990). Privatization became in vogue after 1980s Reagan and Thatcher revolutions (Savas 2000). This ideological movement consequently spread all over the globe along with the expansion of global capitalism (for a critique see Farazmand 1999a, 2002).

Conceptually, the antigovernment bureaucracy movement is driven in large part by the theoretical equivocation of capitalism and freedom, a thesis which Milton Friedman (1982) succinctly but effectively defended. It is a thesis that tries to persuade the reader that capitalism is synonymous to a free market and antonymous to a government bureaucracy. Nevertheless, the evidence does not seem to support this thesis (Piketty 2014). Capitalism seems to be very clearly hierarchical in its outcomes, if not in its nature. It is perhaps for this reason that earlier, Marx (1970, pp. 41–54) vehemently opposed government bureaucracies. As this chapter outlines, the connection between capitalism and free markets is not so straightforward. Instead, capitalism has much more in common with corporate and governmental bureaucracies, which frequently contribute to perpetuating the system of inequitable accumulation of capital.

Still, government bureaucracy is not necessarily opposed to the labor and is not inherently a partner of capital. As Piketty's (2014) historical study of income inequality shows, government policies can clearly ameliorate the level of inequality in the society. The historical evidence is perhaps most sticking in the USA, where a U-shaped pattern in income inequality in the period from 1910 to 2010 is obvious (Piketty 2014, p. 291). In the period after World War II, income inequality declined fairly noticeably. Yet, according to Piketty (2014, p. 294), the upper decile in the 2000s had between 45% and 50% of the national income, an increase from 30% to 35% in the 1970s. This is a colossal change in income inequality that has a lot to do with the changing nature of global capitalism and government policies after 1970s. To echo Piketty's (2014, pp. 481–487) conclusion, the evidence indicates that the "social state" is indeed in need of "modernizing" but not of "dismantling." It remains to be seen to what degree it is possible to modernize government bureaucracies, given their intransigency and resistance to change as well as their tendency for elitism in a capitalist society (Farazmand 1999b; Stanisevski 2004; Weber 1946). The larger conceptual contours still seem clear. What is needed is a government bureaucracy that in the struggle for dominance between the capital and the labor works for the people and is not an oligarchical partner of the capital.

## Introduction

Globally, the absence of bureaucracy in the practice of citizen journalism has generated many criticisms about the influence of citizen journalism on professional journalism and media governance in general. Citizen journalism (CJ) "refers to the participation of ordinary citizens in news gathering and reporting" (Oberiri 2016, 2). In essence, it means that the practice of citizen journalism is not professional journalism. Citizen journalism is the media practice that beats checkpoints, a fast-growing trend in media practice where the preponderance of news gathered is from eye witness or people who send in reports regarding issues springing up around their locality. Nevertheless, its functions in the society are undeniable. In the view of Adilah Ramli in Ellie (2018), "instead of rivaling social media, news outlets are leveraging off the platform to reach a wider audience online." In many countries of the world, the mainstream media source news stories from citizen journalism, and many of the news items in citizen journalism are direct accounts of events from eye witnesses. This lends credibility to the reportage but has highly been criticized for its unchecked freedom that results in the presence of reports that are mindless of language, target audience, morality, fairness, fact, objectivity, and accuracy. In many occasions, there are different versions of the same story. All over the world, citizen journalism has deeply been involved in participatory governance. In the United States, citizen journalism has engaged in whistle-blowing leading to the impeachment of President Donald Trump by the Lower House. In Nigeria, the impact of citizen journalism has been felt in the report of official corruption, religious, and sociopolitical crises, among others. The implications of these due to the absence of bureaucratic checks are hydra-headed. Bureaucracy is seen as an idea that is both good and bad. The entry here therefore focuses on the impact of bureaucracy on citizen journalism, examining the implication on professional media practice.

## Origins

The history of citizen journalism is new. The growth and development of citizen journalism has hugely been facilitated by the emergence of the new media. The new media technology has miniaturized the globe in what Marshal McLuhan in MacQuail (2006) refers to as the global village. This has aided immensely the gathering and dissemination of information from anywhere to everywhere. In all parts of the world, news thrives on events. In many occasions, events that border on conflicts, disasters, and sentiments carry newsworthy elements that command attention. The report of such events is very crucial to the development of citizen journalism as they are hastily gathered and disseminated through blogs, Twitter, Facebook, WhatsApp, and many other new media powered by the Internet. The development of citizen journalism cannot be discussed without making mention of the Internet which powers these media of information gathering and dissemination. It is also called Web 2.0 journalism since its capability in shaping journalism cannot be underestimated. In the United States, debates about the history of citizen journalism are traceable to alternative media and the role of media in community development. In this sense, citizen journalism is also referred to as civic or participatory journalism. It is however observed that the history of citizen journalism varies in different contexts of its invocation. In nations of great political upheavals, citizen journalism can be linked to the struggle by individuals to disrupt the political and media landscape by news sharing or getting involved in intense public debate, while another thought sees it as the claim made by individuals about the legitimacy of the media they produce. The belief that change in the media industry is slow has also necessitated citizen journalism in some climes (Mathson, 2017). Shifting from this paradigm, RonRoss (2011) argues that the history of citizen journalism is as old as journalism itself, predating professional journalism by about 200 years. This is predicated on the background that 200 years after the

introduction of the first newspaper in America in 1690, none of the news writers were professional journalists because the profession had not been created. The press men of the day were just citizens who had the passion or facilities for journalism.

## Bureaucracy and Governance: A Discourse

Bureaucracy is a system of controlling or managing a country, company, or organization that is operated by a large number of officials employed to follow rules carefully. It is also an administrative system designed to accomplish large-scale administrative tasks by systematically coordinating the work of many individuals. It can be said that bureaucracy is a system of governance of offices and impersonal administration. It is a system of administration which a government can adopt to perform its systematic duties (Ukeje et al. 2019).

In spite of the benevolence of bureaucracy to any government in maintaining order and competence, researchers are of the view that it can cause a surge at work due to the much restrictions, protocols, and red-tapism. It is also proven that bureaucrats hardly consent to new method of doing things, thereby becoming an abstraction to innovation and change. Although following protocols or obedience to lay down rules and regulations is appropriate, sometimes due to the urgency of some administration problems, some of these protocols may need to be skipped. One problem with the bureaucratic government is that the rigidity and long protocols in its administrative system hinder the achievement of certain objectives on time. In journalism, it is believed that bureaucracy is the greatest challenge to beating deadlines. Illustratively, in a situation where a student of a university needs to apply or inform the vice chancellor about an issue in the university hostel, he has to write a letter and send it to the Head of the Department who in turn passes to the dean for response who has to approve the letter before it is sent to the Registry department and then to the secretary of the Vice Chancellor before it is finally delivered to be read by the Vice Chancellor. This process sometimes could take days or weeks before conclusion, and by that time, the harm that would have been prevented might be irreversible. It could also happen that one of the officials or gatekeepers could be harshly affected by the outcome of the letter, thereby refusing to approve it to pass his/her table. Many instances like this cause either a slow pace or complete failure in the achievement of tasks.

"Bureaucracy defends the status quo long past the time when the quo has lost its status" (Peter 1980). This statement is not alarming since bureaucracy is an embodiment of rigidity which hinders flexibility in meeting the fast-moving challenges of modern governance. But in spite of the delay in accomplishment of goals, bureaucracy also bears some advantages. It is an obstruction to fraud, corruption, and embezzlement.

## Citizen Journalism: Implication for Media Practice

Citizen journalism is journalism conducted by the people who are not professional journalists but who disseminate information using web sites, blogs, and social media. It is the performing of journalistic functions by non-journalistic professionals through the use of the Internet. Citizen journalism has the philosophy of "you see it, you report it." In this way, everyone becomes a journalist, thereby making the journalism profession unprofessional.

An online entrepreneur in South Korea Oh Yean-Ho declared in the year 2000 that "every citizen is a reporter." Going by this assertion, there is no need for specific people to ascribe themselves as those qualified to report news. If this assertion becomes generally accepted, it could lead to a season or age when there would be no profession like journalism since everyone is now a journalist. It should however be noted that doing something is different from doing

something well. Citizen journalism is the traditional journalism model turned upside down. Rather than being the gatekeeper, it is just opening up the gates and letting people come in without checks. Citizen journalism is therefore very unconventional as it does not submit itself to having every news story filtered through the views of a small group of editors. By this, citizens become their own reporters and editors; nobody comes in between to edit whatever they feel like publishing. This is a distortion of the original practices of journalism.

When there is no gatekeeper to stand at the gate, thieves and other criminals or unwanted visitors can easily enter the house. So it is with journalism when there is no check on what goes out as news. Harmful elements or information could be spread out. Individuals could seize such an opportunity to break media laws like laws of libel and slander, sedition, publishing of obscene materials, and even invasion of privacy. And since there is no check on what goes out as news, such contents could be published to the endangering of the society.

A recent trend in citizen journalism has been the emergence of what blogger Jeff Jervis terms "hyperlocal journalism" as online news sites invite contributors from local residents of their subscription areas, who often report on topics that conventional newspapers tend to ignore. This advancement without bureaucracy could be very harmful to the traditional media because it means that these online sites could get the news first. It also implies that they could lose their audience who may be interested in the reports of citizen journalists who bring news from the local areas. The implication is that the traditional media would not be able to successfully compete with the online media since they have abundant reporters in different strategic areas where they see the event first hand.

Individuals in disaster zones often provide instant text and video reports from the scenes which the professional journalists may not be close enough to do. A typical show of the roles of citizen journalism is in regard to one of its ancestors – Abraham Zapruder, who filmed the assassination of President John Fitzgerald Kennedy with a lone – movie camera. In spite of this, it is recognized that citizen journalism has a lot of flaws when it comes to objectivity and quality. Some of the citizen journalists could be activists within the communities they write about. And due to the fact that they are not trained in the art of reporting, their write ups could be lacking in quality.

Though professional journalists do report news as quickly as possible, they often initially source the news from citizen journalists who have reported it via social media. In fact, 51.8% of journalists according to Cision in Ellie (2018) use social media to find and build stories.

Citizen journalism via social media could therefore be seen as the rawest and unprocessed form of journalism. It provides eye witness and first-hand account. It is the fastest channel for breaking news and gives real-time information, which is what the public wants. "Instead of rivaling social media, news outlets are leveraging off the platform to reach a wider audience online" (www.thesundaily.com). This presupposes that social media or online media does not necessarily challenge or threaten professional journalism. An attempt at reconciling the two however shows that citizen journalism could be complementary to traditional media (Ellie 2018).

Professional journalism can benefit from citizen journalism because it provides a wider range or horizon directly and builds personal relationships. Citizen journalism can provide the immediate news that professional journalists can curate into stories and spread far and wide, or professional journalists can provide the news stories which social media can trend on its media.

The two media, thus, can complement each other's weaknesses. Social media provides immediacy and directness, while professional media provide objectivity, quality, and accuracy. The working together of these two media can bring about a better and faster news gathering and dissemination process to a wider audience. Hence, Sarah Hartley of the Guardian Newspaper

observes that "New technology enables normal people to do reporting. But new technology also improves the monitoring quality of journalism as well."

## Conclusion

Having seen citizen journalism as the collection and analysis of news and information by the general public, especially by means of the internet, bureaucracy is a system of administration distinguished by its clear hierarchy of authority, rigid division of labor, written and inflexible rules, regulations, procedure, and impersonal relationship. Following the entry here, citizen journalism is seen as the opposite of bureaucracy. Citizen journalism dwells on the concept of every man's right and ability to do as he likes, but bureaucracy brings in hierarchy, regulations, and procedures to be followed which citizen journalism does not subscribe to as it seeks to break the boundaries set by bureaucracy.

Media institutions that rigidly adopt the bureaucratic system of administration would surely experience conflicts in their governance, particularly in meeting up with deadline, hence, the need for citizens active participation as an indispensable element of governance (Idike et al. 2019). Also, a bureaucratic government would operate a media which will be under serious censorship and control. Limitation to what would be published based on security of government actions or official secrets may be beneficial to the public but too revealing about government. In such a system, the government may hinder the publication of news items because it reveals evil deeds of a high-ranking official. However, this is something citizen journalism has no regard for. It would simply publish as it receives the information without any coloring or editing.

The bureaucratic government would prefer that the media be under its full control. But since citizen journalism is not submissive, there would be a clash of interest between the two. In countries affected by political upheavals and countries in which the media is being controlled by government, people have used several technological tools like the Internet and social media to share information about vital events which may not be reported in the traditional media. This would seriously benefit the public but anger the government. However, application of sound governance and effective public relations principles in media practice could serve as a panacea to reconcile the clash between bureaucracy and citizen journalism (Ekwunife et al. 2020).

# Bureaucracy and Cooperation

Alikhan Baimenov
Astana Civil Service Hub, Astana, Kazakhstan

## Synonyms

Administration; Bureaucracy; Civil service; Collaborative governance; Forms of cooperation and interaction; Global and regional cooperation; Limiting and stimulating factors for cooperation

## Definition

*Bureaucracy* is a system of administration of state apparatus often with a clear hierarchy, rules and procedures, and special types of internal and external relations that is designed to help solve common problems.

*Cooperation* is the process of acting together in various modalities toward achievement a shared goals or mutual objectives.

## Introduction

It is obvious that every government operates in a unique socioeconomic, cultural, and historic context, impacting administrative traditions and doctrinal fundamentals of perception of goals and mission of civil service and state machinery, the leadership model and corporate culture. Accordingly, this affects the perception of the notion of "bureaucracy and cooperation," both individually and in connection to one another.

At the same time, historically [though the paradigm is changing], the terms "bureaucrat" and "bureaucracy" were mostly perceived by public as secluded and isolated concepts, and "a thing in itself," not capable of responding to societal needs and not oriented at cooperation and interaction. On the one hand, such connotation was very much preconditioned by the history of state formation and its attributed role at that time. On the other hand, it is also explained by the nature of government activity, the results of which seem to be not always tangible, and thus, measurable in a short-term perspective for public.

Cooperation, from the historic perspective [which continues to be true even today], was rather associated with market entities and, to a less extent, with public sector.

Such public perception was also one of the reasons why the twentieth century scientific discourse was characterized by prevalence of publications covering the issues of autonomy of state apparatus, professionalization of civil service, and approaches to bureaucracy development, while mostly neglecting matters of cooperation.

At the same time, in today's globalized world of unprecedented level of interconnection, interdependence, and volatility, the world where the amount of information has drastically increased and where decision-making process requires processing of vast volumes of information and creating effective knowledge management systems, the role of cooperation at different levels becomes crucial.

Cooperation is important at all levels: within the structural units of state bodies (including cooperation between the administrative civil servants and political appointees), between the units, between the state bodies (interagency), with nongovernmental and business sectors, and finally, international (intergovernmental) cooperation.

Undoubtedly, the considerable advent of information and communication technologies brings about both new opportunities and new challenges for development of different forms of cooperation. The latter is primarily preconditioned by more sophisticated citizen demands and expectations as a result of their increased awareness of the solutions available in other countries. Thus, governments tend to operate in quasi-competitive environment, despite the monopolistic nature of their activity. Furthermore, technological development greatly impacts the trust of the citizens and legitimacy of the state, enhancing transparency, accountability, and effectiveness of the public sector. In the end, technological development facilitates cooperation of civil servants with NGOs and business structures, supplementing the limited public sector capacities, with public-

private partnerships being an effective instrument of such cooperation.

Internationally, cooperation is considered to be an important catalyst of progress within the national development plans and the 2030 Agenda for Sustainable Development. Thus, the Sustainable Development Goals, adopted by the United Nations General Assembly in September 2015, call for a new level of revitalized global partnership and cooperation for the sustainable development for all (General Assembly 2015).

Fundamentally, cooperation at all levels and in all modalities is an instrument to take full advantage of the environment, i.e., staff of an organization, institutional, and international partners.

## Factors Affecting Cooperation

Cooperation is subject to the influence of various factors, which may have limiting and stimulating effect, and some of which are implicit or explicit.

The monopolistic nature of the state body functions is one of the factors that can both restrain and stimulate the natural need for cooperation. A taxpayer cannot afford having two state bodies performing the same functions. A state body performs functions as a sole institution and this predetermines the need for cooperation to be able to employ the experience and knowledge of other professionals, state bodies, and governments.

Another factor that discourages cooperation is the lack of time resources. As a rule, while estimating the workload of civil servants, the time required for teamwork and cooperation is not often considered. The high workload of civil servants makes them use their planned time for self-development to fulfill their professional duties. In this way, bureaucrats over time become reluctant to acquire new skills and knowledge, alleging to enough knowledge of the sphere they are responsible for.

The need for an integrated approach to problem solving is often seen central, when speaking of effective cooperation. Within the state body, as well as in cooperation between state bodies, sometimes a common problem that engages the interests of the parties involved can be a stimulating factor. For instance, the introduction of a new health insurance system affects not only the Ministry of Healthcare but also other ministries that regulate such areas as labor, economics, and finance. At the same time, each ministry can have its own vision on this issue. In this case, more active communication between state bodies can contribute to making more balanced and informed decisions.

Furthermore, having clear common goals and being able to work in a team are also viewed as critical for interagency cooperation. Largely, civil servants of interacting state bodies come with specific experience, competencies, and vision. Yet, they are employed to fulfill a common mission and comprehending this is seen as crucial for successful partnership.

Undoubtedly, a productive cooperation very much relies on leadership in state bodies. Metaphorically speaking, leaders need to be like football team coaches, who are specifically proficient in building teams to achieve a shared goal. The best football coaches are outstanding leaders, capable of identifying clear roles and using each player's potential, when creating a team, where everyone is satisfied with his place and role.

Strong desire of civil servants for career growth stimulates them to cooperate and share the experience and knowledge with others to meet new challenges. This suggests the need to revise the system of promotion, so that it encourages and rewards civil servants to cooperate with other structural units, state bodies, and stakeholders (Baimenov 2000).

One of the stimulating factors of cooperation is the emergence of new technologies, which allow for creating and developing new forms of cooperation at all levels. Public-private partnerships can be a good example of cooperation, enhanced, to a great extent, by the technological advent.

In today's era of increasing uncertainty, the tendency to apply agile management models in public institutions to be able to respond to the challenges of a rapidly changing environment is also seen as a factor, which can considerably contribute to cooperation, especially within organizations.

Efficient knowledge management systems in public institutions, when everyone's knowledge,

technology infrastructure, and knowledge sharing practices work in the interests of all, is also regarded as a way to bring about the spirit of cooperativeness into an organization.

Last but not least, it is organizational culture and the system of values of state that create the setting for cooperation and partnership (Baimenov and Everest-Philipps 2016). As a matter of fact, some organizational cultures are inclined to preserve the monopoly status, in which the exchange of information is not a common thing. Such practices require systematic approaches to change the existent traditions in order to encourage cooperation. In this context, creation of environment within an organization that would foster innovations can have a great impact on developing the organization's potential for cooperation.

## Cooperation at Different Levels

Today, effective cooperation at different levels is more important than ever. The pace of global change and the rapidly changing environment place an unprecedented level of demands on the capacity of governments, public governance systems, and civil service.

One of the tools to improve the quality of decision-making is effective internal cooperation between different departments or units at the level of a government agency. This cooperation can take various forms and in the process of such cooperation, different approaches, and methods can be utilized. Yet, despite the diversity in forms and tools of cooperation, they are all a part of the knowledge management system at the organizational level. The examples can be brainstorming sessions, agile groups, project teams, expert working groups, etc., which are used as effective methods of knowledge exchange.

For example, in 2011, the Agency for Civil Service Affairs of Kazakhstan established the so-called Internal Council, where the head of the agency, as a rule, removed the formal hierarchy at these internal council meetings and everyone could freely express their ideas and proposals. These meetings were similar to academic discussions.

One of the effective examples of interagency cooperation is the strategic model of public administration named "Collaborative Governance" (Ansell and Gash 2007). It emphasizes the importance of partnerships and coordination of bureaucratic structures and other actors in the management process to improve their effectiveness. Thus, the structural model of joined-up government is oriented toward horizontal links and integration of state bodies (Wilson et al. 2015).

It often occurs that some administrative cultures may rely on vertical communications, which restrain cooperation both within the agencies and between them. One of the solutions to this may be the requirement to conduct preliminary consultations and discussions with partners horizontally. For example, between 1997 and 1998, the government of Kazakhstan ceased to consider letters with a request to take a certain decision from ministers and governors unless it had been previously worked out horizontally with other ministers (Baimenov 2000).

Another form of interagency cooperation is used by the government of Great Britain, which has created specialized agencies for informatization, public procurement, human resources management, and, what was unexpected, the legal services. The logic behind this decision is obvious and proceeds from the fact that ministers should devote most of their time to resolving priority issues in their industry and formulating an effective policy in their field they are responsible for.

In this regard, it is the separation of minor functions from the activities of ministries and their allocation to separately created structures that allowed the state body leaders to concentrate on core activities. This has led to an increase in the productivity of civil servants' performance and the improvement of all strategic and performance indicators. Having been implemented within the joined-up government framework, these qualitative changes have led to the enhanced horizontal cooperation with other public agencies.

In the 1980s, New Zealand undertook systemic reforms of its public sector. However, after

10 years of reforms, there were still concerns about fragmentation in their public service (Joined-Up government, Efficiency Unit Report 2009). A report called *the Review of the Centre*, published in 2001, displayed the need for a greater focus on outcomes of public policies, as well as improved interagency cooperation between its 170 public agencies. In 2003, the government commenced a new set of reforms to develop interagency cooperation between its state bodies. As an outcome of these initiatives, the Economic and Urban Development Office has been created, joining up the objectives of the Ministry of Economic Development, the Ministry for the Environment, and the Department of Labor (Efficiency Unit 1990).

In Finland, new initiatives have been introduced at the senior political level to achieve closer interagency cooperation within its civil service. Each year, the government identifies several priority areas for development which require horizontal or cross-ministerial cooperation to attain policy targets. Each priority area has a minister who is responsible for the progress in this area and manages a group of other relevant ministers.

More and more complex societies enable government officials to develop new models of public governance in which public organizations cooperate with their institutional partners, civil society, and other stakeholders.

As an example of such cooperation, in 2011–2014, the Agency for Civil Service of Kazakhstan established the Expert Council, which included representatives of academic circles, NGOs, and the private sector. At the meetings of the Expert Council, both projects and conceptual approaches were discussed.

In the current world, the bureaucracy ceases to be at the forefront of innovation, and new solutions from the private sector are applied with varying degrees of activity and success in government bodies.

A close cooperation of the public sector with business structures helps to define more clearly the social and economic goals that can be achieved through the participation of all stakeholders (Witters et al. 2012).

Moreover, the use of innovations and new information technologies leads to enhanced transparency of public agencies, making the results of their activity more tangible for the society and significantly reducing the time and financial resources that civil servants and citizens spend in interaction. In this way, the advent of technologies considerably facilitates the activities of the state bodies, the creation of partnerships, and cooperation.

Sometimes, information technologies are used in unexpected forms and spheres. A vivid example is the experience of applying new technologies in the agricultural sector of the People's Republic of Bangladesh. The government of Bangladesh has developed a mobile application for farmers growing sugar cane. This application informs farmers about the actual prices for reeds, thereby preventing price dumping in the market and protecting farmers (Prime-Minister's Office 2017).

Another example is the use of data from hospitals, emergency, and social services for the government's assessment of healthcare needs in the United States. The obtained data allows determining the necessary need for medical assistance or other social services and assessing the risks associated with the peculiarities and conditions of each region.

The "Living Cities" project in the United States of America, which uses an integrated approach to improve the lives of low-income people and revitalize the urban areas, is another case. The "Living Cities" project aims at strengthening partnership of the government and private sector on key urban issues (Witters et al. 2012).

Another example is the European experience in creating Living Labs PPP in cooperation with the state and private companies that established a user-driven open innovation ecosystem. In these centers, users experiment and test new ideas, new products, and new services in the field of ICT.

Public-Private Partnerships usually require collaborative approach in the decision-making processes and such cooperation leads to the improvement of public services in such spheres as education, transport, economic development,

healthcare, and others which are all of great importance for the citizens.

## International Cooperation

As previously stated, every government works in a unique socioeconomic and historical environment and addresses its own country-specific challenges, mindful of various factors. The enhancement of public governance systems requires that not only this context, but also global and regional trends as well as best international practices should be taken into account.

This is also underpinned by the assertion that there can be no teachers and students in this matter: there are countries with various income levels demonstrating effective solutions to different public governance issues; and there are also countries that are facing challenges in finding effective solutions (Baimenov 2017).

As such, international cooperation for addressing these challenges is so important. At the same time, cooperation in this matter is sensitive as its modality has to be very accurate to make it sustainable.

All of these concerns have led to finding specific mechanisms for international cooperation for institutional and civil service development in various forms, including joint research projects, joint capacity-building interventions, and peer-learning activities.

Good examples of this can be found in different parts of the world.

For instance, *the UNDP Global Centre for Public Service Excellence (GCPSE)* represents a unique form of cooperation. It is a joint venture of the Government of Singapore and the United Nations Development Program (UNDP). GCPSE conducts activities that identify civil service trends, innovations, and solutions. It draws on Singapore's advanced experience in civil service development as an inspiration for other countries seeking to build a professional civil service.

GCPSE works with leading research organizations, universities, and practitioners, and examines civil service trends and innovations and brings to light new knowledge relevant to emerging economies predominantly of the Asia-Pacific region.

GCPSE's agenda is underpinned by four significant factors fundamental to successful achievement of civil service excellence:

- "Cooperation between political and administrative leadership
- Motivation of public service officials
- Adaptive Governance – long-term planning, foresight, and complexity
- Innovation in Public Service" (UNDP 2016)

The *Effective Institutions Platform (EIP)* represents another type of international cooperation modality. EIP is an alliance of over 60 countries and organizations that support country-led and evidence-informed policy dialogue, knowledge sharing, and peer learning on management and institutional development in the public sector.

The OECD-led platform assists its members in their pursuit to develop accountable, inclusive and transparent public sector institutions capable of delivering responsive policies, effective resource management, and sustainable public services.

Another cooperation form that the EIP supports is Peer-to-Peer Learning Alliances. Learning Alliances are "collaborative multi-stakeholder groupings of institutions and organizations drawn from multiple contexts and countries that share knowledge, experiences and innovations on specific public sector reform topics" (EIP 2016).

Learning Alliances give peers the opportunity to learn from each other in a professional setting to explore successes and failures in public sector reform initiatives (EIP 2016).

Another example of international multi-stakeholder cooperation emerged in the CIS region. After gaining independence the countries of Central Asia and the CIS region embarked on institutional reforms. Inadequate knowledge base, the lack of evidence-informed solutions, practical tools, and guidance as well as of attention to emerging and innovative public administration and management models are all contributing to a rather low level of cooperation between the countries of this region on civil service development.

Toward addressing these concerns, the Republic of Kazakhstan together with UNDP had initiated the creation of the *Astana Civil Service Hub (ACSH)* in order to serve as a multilateral, institutional platform for continuous exchange, and upscaling experience and knowledge in the field of civil service development; stimulate civil service transformation in the region, through capacity development and south-south and triangular cooperation mechanisms; and produce innovative approaches to civil service development through evidence-based research.

ACSH's efforts in fostering partnerships resulted in 38 participating countries, the geographical range of which stretches from North America and Europe through the CIS, Caucasus, and Central Asian region to ASEAN countries, thus promoting regional as well as interregional cooperation. It is noteworthy that there are more than 30 institutional partners from different parts of the world, among which the OECD, European Union, American Society for Public Administration, and others, that accumulated significant knowledge bases.

Serving as a multilateral platform to promote civil service excellence, the ACSH launched the Innovative Solutions Scheme aimed at supporting initiatives to modernize public administration, improve public service delivery, and encourage innovation and creativity in public institutions.

Bearing in mind the demand from participating countries, the ACSH launched a Peer Learning Alliance of Kazakhstan, Azerbaijan, and Georgia to share their best solutions on public service delivery using one-stop-shops principle. The Alliance is the ever first implementation of the OECD EIP's Peer Learning Guide, capturing tacit knowledge of the countries in public service delivery (EIP 2016). This has contributed to the interactions among ACSH stakeholders to become more systemic.

International cooperation is one of key determinants of success and sustainability of any public sector transformation. The above illustration of examples of international cooperation allows us to conclude that there are some important factors that should be considered when developing such kind of cooperative arrangements. In particular:

- Flexible and demand-driven agenda. There is a demand for development solutions and knowledge, expertise transfer from the participating countries with common context and challenges taken into account. So, it is always important to carefully choose the right area for dialogue and sharing.
- Serving culture of the initiative. Importantly, national reform agendas are exclusively set by the national governments themselves. ACSH exists to serve and contribute to building the capacity of participating countries to reform.
- Cross-sectoral collaboration. Bringing together both scholastic knowledge and practical expertise.
- Benchmarking towards best regional and global practices in the field.
- Exchange of success stories and best practices.
- Promotion of less red tape and more open and pragmatic approach.

As illustrated above, international cooperation can take various forms though the list does not represent the exhaustive models thereof. While sharing best international practices serves as a useful tool in finding well-informed solutions, it is sensitive in terms of the development of bureaucracies at the national level.

It is not a coincidence that the international community has recognized the importance of international cooperation. One of the major developments in the global sustainable development agenda is the proposed Goal 17 which aims to promote strong commitment to cooperation at all levels as an important way to share knowledge and experience as well as advance innovations (General Assembly 2015).

## Conclusion

Evolution of countries and transformation of their role, sophisticated and complex societal expectations toward the governments outline the ways to enhance effectiveness of public governance. Alongside the traditional instruments, such as the principle of meritocracy in selection and promotion processes, professional capacity building

instruments, utilization of the innovative information and communication technology, application of modern management methods and others, cooperation at national level, and globally acquires particular significance (Global and Regional Trends in Civil Service Development 2016).

In this way, cooperation in the context of bureaucracy is understood as an act of government bodies working in a simultaneous way to ensure the systemic workings of the established administration system thus creating a synergy between bureaucracy and cooperation akin to that of a well-oiled machine. In its turn, bureaucracy in the context of cooperation is that of an administrative structure (public but not limited to), which is maintained by systemic collaboration of its structural agencies thus creating a synergy in the work of all involved parties.

Overall, the ability to collaborate is crucial at all levels: within the structural units of state bodies, between the units, between the state bodies, with nongovernmental and business sectors, and internationally.

Fundamentally, cooperation is an ability to take full advantage of the environment, i.e., staff members, other partners, and systems.

It is clear, that although not necessarily used straightforwardly, the term "cooperation" is firmly established in the routine activity of bureaucracy. In fact, any global, regional, trade, economic, or political associations are various forms of cooperation, the effectiveness of which, in most cases, lies in the particular requirements to the civil servant competencies.

Over the last decades, ability to work in a team, build partnership relations, and effectively engage with third parties have become an integral part of the qualification requirements for civil servants. It is also proved by the latest OECD report "Competencies for Effective Civil Service," which also necessitates the development of the abovementioned competences of civil servants. Thus, it identifies four key areas, required in the relationship between the civil service and society it serves, including policy advice and analysis, service delivery and citizen engagement, commissioning and contracting, and managing networks (OECD Public Governance Review 2017).

Undoubtedly, cooperation stands ever more important in today's globalized world. Attaining ambitious targets of the Global UN Agenda appeals to revitalized global partnership and cooperation, is set as a separate goal 17.

Thus, bureaucracy, both presently and in the future, will hardly be able to evolve effectively without cooperation.

# Bureaucracy and Culture

Tomasz Olejniczak
Kozminski University, Warsaw, Poland

## Synonyms

Bureaucratic control; Clan control; Cultural control; Organizational culture.

## Definition

Bureaucracy refers to the way of organizing people characterized by functional specialization, formal rules, laws, regulations and hierarchical relationships.

Culture refers to the way of organizing people characterized by group work, socialization, informal norms, shared assumptions and values, dispersed authority, and codependence.

## Introduction

Bureaucracy and culture are two vast research topics each with a rich tradition and abundant academic literature. Although these two concepts do not come into mind as an obvious association, in the existing literature, particularly in the context of organizational control (Jaeger and Baliga 1985) and new public management (Osborne and Plastrik 1997), they were often positioned at the opposite extremes. A more in-depth reflection on the nature of these two concepts (Du Gay 2005), particularly from a dynamic perspective of organizational life cycles (OLC) (Cardinal et al. 2004; Kirsch 2004; Yasuyuki and Olejniczak 2014), demonstrates that the relationship between these two concepts is not as simple as previously argued and might require additional longitudinal studies.

The purpose of this entry is to provide a concise overview of these two major theoretical concepts with a particular focus on the relationship between them. It begins with a brief overview of theoretical origins of both concepts, which indicates historical context in which these two came into being. Next it discusses the relationship between bureaucracy and culture by positioning them in two different social science paradigms, illustrating the usage of both concepts in the debate concerning modes of organizational control and presenting some alternative perspectives. Then the relationship between both concepts is discussed in the context of public management literature. This entry concludes with the notion of interconnectedness of bureaucracy and culture while discussing the implications for theory and practice.

## Theoretical Origins

The origins of the concept of bureaucracy ought to be traced back to Max Weber (1947) who was the first to clearly define characteristics of an ideal bureaucracy as universal form of governance; these include:

- Fixed and official jurisdiction areas ordered by rules, laws, or regulations.
- The principle of office hierarchy and of levels of graded authority, which establishes a system of super- and subordinate relationships.
- The management of modern office based upon written documents.
- Office management based on expertise.
- Full-time employment of officials.
- The management of the office follows general rules, which are stable, exhaustive, and can be learned.

This classical characterization remains largely unchanged to this day. While traces of some of the characteristics can be found in all subsequent definitions stressing rational, specialized, formal, and hierarchical nature of bureaucracy, other crucial characteristics such as the importance of specialized knowledge and expertise or the importance of archiving and management of knowledge in the form of files became somewhat overlooked. The concept of culture is much less clearly defined, and it has been widely recognized as one of the trickiest theoretical concepts (Alvesson 2012). Its

origins can be traced back to anthropology and sociology while the peak of the debate in 1980s under the influence of Japanese investments and Japanese methods of management. In the broadest sense, culture is defined as set of basic assumptions developed by a given group, which shape the norms, values, and behavior patterns (Alvesson 2012), or as Hofstede defines it a "software of the mind" that distinguishes one group of people from the other. In this entry, culture is understood narrowly as a way of organizing people rather than an anthropological or social phenomenon.

## The Relationship Between Bureaucracy and Culture

### Bureaucracy and Culture in the Light of Sociological Paradigms

In order to fully grasp the nature of relationship between bureaucracy and culture, it is useful to refer to Burrell and Morgan's sociological paradigms. Paradigms in social sciences constitute a particular view of world and can broadly be divided into four groups along two dimensions representing views about the nature of science and society, i.e., subjective-objective dimension and regulation-radical change dimension (Burrell and Morgan 1979, p. 22). What is interesting is that while bureaucracy and culture differ in one of these dimensions, they show significant similarity in the other. While the concept of bureaucracy in its classical form (Weber 1947) is the embodiment of a belief in objective reality, the concept of culture, and in particular the notion of "cultural relativism" advocated, embodies the opposite extreme of the subjective-objective dimension. This dichotomy has often been embodied by a conceptual distinction between hard structural and soft cultural elements of organization. Situation is different, however, in the dimension of regulation-radical change where both bureaucracy and culture clearly advocate regulation whether it is formal, informal, or normative. As a result, research on bureaucracy falls into functionalist paradigm, while research on culture falls into interpretivist one; both of these paradigms are focused on regulation. This commonality becomes evident in case of research on modes of organizational control, which constitutes the main common theoretical platform on which both concepts were discussed in relation to each other.

### Bureaucratic and Cultural Modes of Control

Organizational control is defined as actions taken in order to decrease the uncertainty related to spontaneous behaviors of organizational members and to direct their efforts toward the attainment of organizational objectives (Flamholtz et al. 1985). Early literature on organizational control tended to focus on outputs while bearing strong resemblance to the main characteristics of ideal bureaucracy including rationality, impersonality, stability and continuity, formal schedules, hierarchy, specialization, and standardization in terms of content and channels of communication (Weber 1947). Subsequent studies on "cybernetic" models of organizational control extended these early contributions by adding measuring, assessment, and feedback mechanisms, which permitted organizations to regulate themselves while correcting deviations in organizational behavior (Flamholtz et al. 1985). The underlying idea remained the same as in case of bureaucracy since cybernetic models perpetuated the assumption of the objective nature of organizational reality. This view has been challenged by representative of the cultural stream of research, which at the time was emerging in the area of organizational theory. Hofstede (1978) questioned the division of responsibilities between controller and controlee providing an example of semiautonomous work groups, in which measuring, comparing, feedback, and intervening are carried out within the group. In a series of article devoted specifically to the issue of organizational control, Ouchi pointed out that due to limitations in the availability of output measures and explicit knowledge of the transformation process control based on output may be inefficient and may need to be supplemented by control of behaviors or control of symbolic nature (Ouchi 1980). In his typology of control, bureaucratic control represents control focused on behaviors since the outcomes are not easily measured while procedures are clear. Based on his observations made in

Japanese companies, in extreme cases when both the ability to measure output is low and the knowledge of the organizational transformation process is imperfect, he advocated so "clan control" (Ouchi 1980). The outcome of this debate was a taxonomy of organizational control modes which tended to distinguish "bureaucratic" and "cultural" modes of control as two extremes (Jaeger and Baliga 1985; Kirsch 2004; Raelin 2011). The table below presents comparison of characteristics of both modes of control in terms of measurement, evaluation, rewards, and roles and relationships of organizational members.

| | Bureaucratic control | Cultural control |
|---|---|---|
| Measurement | Measurable outcomes and explicit behaviors | Implicit norms and shared goals |
| Evaluation | Formal exchange of information based on written documents | Informal exchange of information based on dialogue and interaction |
| Rewards | Pay, bonuses, promotion/ demotion based on following the rules or achieving targets | Group recognition and peer pressure based on acting in a manner consistent with group |
| Roles and relationships | Hierarchical | Group work |

Source: Jaeger and Baliga 1985; Kirsch 2004

"Bureaucratic control" represents a formal mode of control, in which both behaviors and outcomes are subjected to measurement and formalized assessment based on standards. Rewarding in this mode of control is formal, tangible, and based on clear criteria, which describe desired behaviors or intended targets. Similarly roles and relationships are clear and described in the form of hierarchies (Jaeger and Baliga 1985). On the other hand, "cultural control" represents an informal mode of control, in which implicit norms, values, and goals shared by organizational members guide their behavior and constitutes the main frame of reference for measurement. Evaluation is performed trough constant interaction, socialization, and/or dialogue, and behaviors consistent with group expectations are rewarded with recognition or punished with peer pressure or exclusion. Roles and relationships among organizational members will be characterized by dispersed authority, group orientation, and codependence (Jaeger and Baliga 1985). Although useful, this dualistic taxonomy proved to be rather simplistic especially in the light of organizational life cycle (OLC) literature.

## OLC Perspective on Bureaucratic and Cultural Modes of Control

Organizational life cycle (OLC) models are based on an assumption that development of an organization follows a predictable pattern, which can be characterized by development stages, which are sequential in nature, occur in a hierarchical progression that is not easily reversed, and involve a broad range of activities and structures (Quinn and Cameron 1983). Conceptually OLC models represented a shift from a "static" or "snapshot" approach to a more comprehensive dynamic analysis (Kirsch 2004). What is most important is that in OLC models control often constituted one of crucial indicators of the organizational development stage (Quinn and Cameron 1983). Even more interesting was the fact that, although different OLC models conceptualized organizational control, under different names of formalization, bureaucracy, and structure, they observed similar phenomena of mode of control moving from informal to formal and then to informal again (Quinn and Cameron 1983). These observations were later on confirmed by empirical studies. For example, Laurie J. Kirsch (2004) has found empirical proof for the coexistence of two modes of control in the context of IT projects. He found that in the first phase of the project mostly informal modes are used, in the second phase focus shifts to formal control, and finally in the third phase both modes coexists and interact with each other. Further empirical evidences were delivered by Cardinal et al. (2004), who using their in-depth single case study of a moving company extended existing perspective on modes of control adding the notion of "latency." What they found was that although modes of control tended to switch from informal to formal and back again, neither of these modes

disappeared completely but remained latent only to reappear in later stages.

## Bureaucracy and Culture in Public Management Literature

Despite much longer tradition and much deeper understanding and appreciation for the notion of "bureaucracy," debate concerning relationship between bureaucracy and culture in public management literature bears significant resemblance to approaches discussed in management and organizational theory.

Weber's routinization of charisma (1947), which illustrates the process of gradual formalization of an informal authority based on shared values, which ultimately leads to development of a bureaucratic form, has touched upon the dynamics of the relationship between bureaucracy and culture long before OLC perspective came into being. This contribution however has been overlooked as large number of critics of bureaucracy began to implicitly or explicitly employ culture in order to point out its limitations. Some of the earliest critics pointed to the risk of dehumanization and impersonal rule-based, rational control (Merton 1957), which was one of the first attempts to stress the dichotomy between soft subjective nature of human culture and hard objective reality of bureaucracy. Later on Osborne and Plastrik (1997) explicitly called upon the creation an entrepreneurial culture as way of banishing bureaucracy and improving the efficiency of governance. These extreme views continued to echo in the discourse on the nature of post-bureaucratic administration imitating flat, decentralized, modern corporations based on autonomous work groups.

Some researchers took a more balanced stance perceiving bureaucracy and culture in a symbiotic rather than adverse relationship. For example Raelin (2011) pointed out that the efficiency of bureaucracy relies on organizational culture. He argues that bureaucracy as a way of organizing work is in itself is neutral; consequently whether the bureaucracy will lead to dysfunction or will bring the positive effects depends largely on the cultural aspects of the organization. Other researchers go even further in combining the two concepts and treating bureaucracy as an embodiment of "role culture" and including it directly into their taxonomy of organizational cultures.

Only recently we notice a more in-depth look into the nature of relationship between bureaucracy and culture in public management debate. Du Gay, who is one of the most notable proponents of bureaucratic form of organization, points to the fact that bureaucracy is much more complex and universal phenomena than often given credit, and since it can be found in all cultures, despite its dysfunctions, it must fulfill some important social need (Du Gay 2005). As a result, he urges for more studies into the nature of bureaucracy and role it plays in different cultural contexts. What is interesting is that Weber's mechanism of routinization of charisma, which might shed some light on dynamics of bureaucracy and culture, has not been as of yet extended.

## Conclusion

This entry provides a brief overview of the notions of "bureaucracy" and "culture" and the relationship between them. It demonstrates that even on the level of paradigms, these two concepts have a lot in common, which is exemplified by their adoption in the literature on organizational control. It has been shown how this relationship and interconnectedness of bureaucracy and culture can be understood better when supplemented by a dynamic perspectives offered by the OLC and evolutionary approaches. The final part of this entry demonstrates that the usage of both concepts within public management literature bears significant resemblance to debates in a broader field management and organizational theory. Theoretical implications include the need of overcoming the dichotomy of bureaucracy and culture and adopting a longitudinal perspective when researching the organizational phenomena related to these two concepts. From the point of view of practitioners, it might be useful to perceive the two concepts on a single continuum. One of the surprising implications resulting from such

perspective is that the road to strong organizational culture leads to bureaucracy and that in mature organizations, formalization, standardization, and measures should all be perceived as means of supporting and facilitating organizational culture.

# Bureaucracy and Democracy

Eran Vigoda-Gadot
Division of Public Administration and Policy, School of Political Science, University of Haifa, Haifa, Israel

## Synonyms

Administrative structure; Citizens involvement; Democratic values; Governability; Organizations; Paramedical order; Political participation; Power flow

## Definition

Bureaucracy is thus a formal administrative order of actions by government (Farazmand 2009) and a mechanism to implement public policies. Democracy on the other hand is a political system of ruling and being ruled in return, based on elections, representation, and the rights of the people in a specific national entity (Mosher 1982).

## Introduction

One of the major ironies in modern governance is the complicating and confusing relationship between bureaucracy and democracy. This relationship can be viewed as a tango where both spheres are independent but still closely related in a unique way. As in a tango, they move together in different directions, keeping their distance from one another (Vigoda-Gadot and Mizrahi 2008), but in the same time seeking close contact and effective interaction. On one hand, building strong modern societies relies heavily on efficient

mechanisms for running the state, formulating wise policies, implementing them in good order, and thus providing excellent public services to citizens. However, at the same time, these mechanisms are expected to integrate themselves into a liberal environment of the "open society" (Popper 1991). Since the rise of the democratic ethos after World War II, the ideology of an open society encouraged stronger commitment to people's rights and a concern for freedom of choice, an environment that listens and responds to the voices of various segments of the society. Consequently, there are many occasions when bureaucratic mechanisms of formal order and strive to effectiveness seemed to be a barrier to a prosperous open democracy. From the other end and quite similarly, core democratic principles clash with ideal types of bureaucracy. This entry deals with the meaning, evolvement, and future of the relationships between democracy and bureaucracy in a highly globalized world. It touches political, ideological, social, and administrative aspects of the tango-style relationship with both old and new envisions.

## Bureaucracy and Democracy: A Paradox of Governability Under Stress

For most people, bureaucracy is related with the Weberian view of formal organization with hierarchy and order. Bureaucracy is thus a formal administrative order of actions by government (Farazmand 2009) and a mechanism to implement public policies. Democracy on the other hand is a political system of ruling and being ruled in return, based on elections, representation, and rights of the people in a specific national entity (Mosher 1982). Whereas there are handful of definitions for both bureaucracy and democracy, they represent quite different entities in terms of power flow, authority, and values. Thus, it is not surprising to find that bureaucracy and democracy do not live together happily. Whereas bureaucracy is the art of mastering others using hierarchical mechanisms of organization and formalization, democracy is built to echo the voices of many in an attempt to limit the power of few and balance the paramedical power chain with authentic impacts of citizens (Gawthrop 1997; Waldo 1977). This unhappy marriage reflects a paradox which largely affects current discontent in modern nations. The decline of the welfare state as a top-down transition of governments toward more restrained socioeconomic policies is one side of the story. This process is accompanied by bottom-up pressures from citizens who are demanding a greater involvement of the state in shaping people's lives. The demands create a gap between the public's expectations and the ability of the government to meet these expectations given its increasingly limited resources (Vigoda-Gadot 2009).

Governability under stress is similar to a body under stress. The curve model of stress suggests that bodies, physical or abstract, can bear a limited amount of external pressure. To a limited extent, such pressure can be productive and constructive. However, beyond a critical point, we should expect a breakdown. Indeed, governability in many modern nations has reached, or at least is quickly approaching, that critical point. The crisis that is on the horizon is reflected in the clash between democracy and bureaucracy, a clash that is defined here as the paradox of two desirable visions battling over the same time and space. One vision seeks an effective and responsive government while the other strives for political freedom and the maximum level of choice and voice.

Figure 1 presents the classical clash between the bureaucratic and the democratic ethos. While this is not a new model, it does highlight the black box of interfaces between these arenas. As suggested by Fox and Miller (1996, p. 15), this paradox is a reflection of the dichotomy between politics and political administration. "On the administration side are hierarchy and chain of command, enabling elected officials to both control nonelected career officials and superintend their carrying out of the people's will. Because they are not themselves elected, administrators (bureaucracy) must be neutral malleable tools so that elected officials, who embody the will of the people (democracy), can have their way and be held accountable for whatever does or does not get done."

**Bureaucracy and Democracy, Fig. 1** The pyramidal paradox of democracy and bureaucracy (Vigoda-Gadot 2009)

## Public Administration in the Fire Zone of Bureaucracy and Democracy

It is not surprising though that the nexus between bureaucracy and democracy has become a puzzling research arena and the object of attention by both academics and practitioners worldwide over a number of years (Mosher 1982; Thompson 1983; Waldo 1977). This research track also affected the theory and models of new governance (Buss et al. 2006), New Public Management (NPM) (Christensen and Laegreid 1999), and a wave of third-way ideology for running the modern state that has become so popular in the early years of the twenty-first century. Notwithstanding, a common denominator of all these approaches and doctrines is the belief that reconciliation can be infused into the widening gap between public administration under pressure and democracies under threat.

Previous studies on the relationship between bureaucracy and democracy in modern societies suggest that many of the elements of one conflict with those of the other. Back in the 1970s and 1980s, this tension was discussed by Mosher (1982), Thompson (1983), and Waldo (1977). Woller (1998) encouraged finding ways for the "reconciliation of the bureaucratic and democratic ethos," as the two are basic aspects of modern life in free nations. Similarly, more recent studies by Vigoda-Gadot and Mizrahi (2008, 2014) suggest conceptual frameworks for the understanding of the nexus between bureaucracy and democracy. According to this line of thinking, managerial quality and participation in decision-making are essential antecedents of perceived performance in the public sector. How citizens view the performance of the public sector may, in turn, affect democratic values such as trust in administrative agencies and trust in government, as well as participatory behavior of various types.

## Models of Bureaucracy and Democracy in a Globalized World

In recent decades, reforms in public administration, and especially the New Public Management (NPM) doctrine, have raised many questions as to the role of citizens and governments in our modern societies. This leading contemporary paradigm in public administration has emphasized

the need to improve administrative performance and to treat citizens as clients, to create an ethos of a businesslike public sector and a market society. However, NPM and the new age of bureaucratic ideology has drawn fire from various fronts: from those who seek the improved governability of state agencies, from those who have prophesized a resulting decline in citizenry activism and involvement, and from those who have predicted serious damage to democratic values. The call for increased responsiveness by public bureaucracies in some ways contradicted the basic need for strong governments and for improved governability. It was also countered by pressure for more collaboration between bureaucracies and social players. This second paradigm believes that the goal of improved bureaucratic performance can be accomplished only by safeguarding and advancing democratic values (Vigoda-Gadot 2003).

In light of the above, it seems worthwhile to enlarge on the discussion about two major topics related to public administration and modern societies, namely *governability* through improved performance and *democracy* through liberal values. The conceptual territory between them is in fact a strong reflection of the democracy and bureaucracy paradox. In many ways such a discussion calls for a better balance between managerial/administrative theories and social/humanistic ideology, and the creation of a much more realistic understanding of public administration. It seeks a golden path between the needs and constraints of modern nations as market societies, and the desires and demands of the citizens of liberal states. This golden path should lead us toward effective governability that preserves democratic values. While bureaucracy and democracy are frequently perceived as two separate concepts, they also have complementary meanings that are central and essential for the prosperous growth of our societies, states, and nations.

Literature in public administration follows two complementary tracks for understanding changes and progress in the discipline: those that favor the bureaucratic framework of managed change and those that advocate a bottom-up transformation based on public choice. Similarly, there are two major theoretical models for reforming public administration: (1) administrative/bureaucracy-driven models and (2) democratic/citizen-driven or grass-roots-driven models. Both of these models imply change in the public sector, each from a different starting point. Both models are practical and possible. Neither of the models, however, is superior to the other. They are both legitimate abstractions of a very complicated reality where changes can work either way.

Administrative-driven models represent top-down governability. They view government and public administration as those who are responsible for the initiation of change and for making it work properly. On the other hand, grass-roots-driven models represent bottom-up governability. They make more demands of the people, expecting that they, instead of governments and bureaucracies, will make the first move toward change and reform. Hence, these models demonstrate how various reforms became successful when emanating from the urgent needs of individuals and groups or from the spontaneous collective support for an original, popular leader.

## The State Dominance: Administrative-Driven Models and Top-Down Governability

The most conventional path to governability, change, and reforms in public administration is by top-down initiatives of the state and a planned transformation from "old" to "new." A planned change by the government assumes that the state must lead national progress and development through effective tools of strategic thinking, the professionalism of public servants, and a balanced integration of political, economic, and social considerations. The idea of top-down governability is supported by the rational choice theory and by rational decision-making models. According to this approach, democracy functions to maximize the interests of all citizens and individuals of a national system. Hence, bureaucracy serves as a tool to facilitate the required change. Consequently, budgets, allocation of resources, employment of public servants, strategies for problem solving, and other core issues in state management are all subject to the rational thinking of

disinterested politicians and professional public servants.

However, rational choice theory originally suggests that humans are motivated by self-interests. Based on utilitarian philosophy and game theory arguments, it has been posited that individuals, as well as groups and institutions, generally operate according to desired goals and objectives. These may be formal or informal, but they always aim at maximizing personal benefits and minimizing costs (Ostrom 1990). On the assumption that social players constantly seek more revenues and at the same time attempt to reduce expenses and negative consequences, top-down initiatives may be problematic because the utopian view of collectivist vision contradicts human nature and self-centered interests. Thus, useful and long-range successful policies will emerge only in those cases where high ranking policy makers see a personal benefit (i.e., political, economic, psychological) in making a process work.

As opposed to this rationality, healthy and prosperous civic societies in practice seek higher levels of cooperation among their members to increase general "public goods" and to improve the welfare and well-being of large communities. Thus, collaboration is frequently initiated from the top down and may be referred to as another mechanism for conflict management (Vigoda-Gadot 2003). For example, Frederickson (1997) elaborated on the usefulness, but also the fragmentary nature, of analyzing conflict management methods in public domains as a continuum ranging from competitive to cooperative techniques. While the former represent a win-lose game, the latter are better described as win-win alternatives. Between the two extremes, several other alternatives exist such as litigation, arbitration, mediation, facilitated problem solving, and collaboration. However, these alternatives may be always subject to the basic contradiction between utilitarian human nature and the desirable altruistic nature of civic societies. For the emergence of reliable and honest leadership that plans ahead and initiates top-down ventures that accord well with citizens' needs and desires, a balanced mixture of self-interests and collective interests must be maintained. In top-down models of governability, egocentrism and communitarianism must find a way to coexist in peace. Consequently, healthy top-down initiatives in public domains depend on rational choice models, on social/economic exchange theory (i.e., Blau 1964), and on the collective vision of communal solidarism. Whereas false top-down initiatives are typical of nondemocratic regimes, true top-down changes exist only in liberal environments and prosperous societies, those that abound in mutual understanding and acceptance of others' needs and aspirations, but that also value the idea of free markets and free exchange mechanisms among people. Wherever such acceptance and approval are sparse, there is a greater likelihood of alienation from governments, distrust, diversification, intolerance, conflict, and self-centered activity rather than concern for society at large or public solidarity. In such cases, top-down initiatives of public policy are counterproductive, and the alternative path of bottom-up initiatives flourishes.

### The Peoples' Dominance: Citizen-Driven Models and Bottom-Up Governability

The less conventional track for governability relies on the democratic ideal of grass-roots change and reforms. As suggested above, the grass-roots-driven models represent bottom-up governability and make more demands of the people, expecting them to be more involved, active, and innovative in determining their lives and quality of life. Citizens, instead of governments and bureaucracies, are those who need to make the first move toward change and reform because they are the ones who will be affected by those changes.

Letting the people lead involves many partners who initiate a process of change in policies, services, and administration based on the voluntary actions of citizens as individuals and as groups. As will be demonstrated in the next chapter, the meaning of citizenship and of citizenship behavior is similarly transformed to cohere with this change in mindset in modern nations. According to this approach, the administrative state no longer has the monopoly on reforms and formation of policies. The state relies quite often on the

motivation and power of voluntary groups, on citizens, and on the third sector in general for performing tasks that in the past seemed to be within the purview of public officials and of politicians. Jordan et al. (2005) suggests that at the center of the debate about models for governability is the question of "who or what steers society." According to Jordan et al. (2005), a distinction must be made between the meaning of government and the meaning of governance. The governance debate is essentially concerned with understanding who or what steers society. Thus, under a government approach, society is steered by a central government, whereas in a governance model, "society actually does more self-steering rather than depending upon guidance from government" (Peters 2000, p. 36).

Without a doubt, we live in an era of great challenges for democracies and for free citizens, some of which come from the duality of the meaning of government and governance. The twenty-first century will necessitate enormous changes in our conventional perceptions of governability from top-down initiatives to higher levels of citizen involvement and participation in policy making and implementation. Thus, a similar reformation of the meaning of citizenship and a redefinition of the role of citizens in democracies and in bureaucracies is expected. This process will undoubtedly have an impact on other stakeholders in the public sphere, in private sector firms, in the third sector, in the media, in academia, and all of them in the international context. All these players, and others, will need to find better ways to collaborate, innovate, and change, and it is the role of academic activity and studies to pave the way for such productive interaction.

Moreover, the growing trend of bottom-up initiatives should be encouraged by governments as it has several advantages: (1) *building strong nations* with stronger and more deeply involved citizens; (2) creating an *active and responsible* citizen, rather than a passive and dependent customer; (3) *sharing the burden* of caring for and improving society among the many stakeholders of society; (4) highlighting *collaboration and partnership* instead of conflict and dissention in democracies; and (5) encouraging grass-roots *innovation* from the people who will benefit from it.

## Bureaucracy, Democracy, and the Decline of the Welfare State

Since the second half of the twentieth century, the welfare state in Europe, as well as in many other parts of the world, has been in decline. Many books and articles have depicted the crisis that has resulted from the movement of the state away from its former role as caregiver to its citizens. Razin and Sadka (2005) deal with the problem of the withdrawal of the state from its commitment and responsibility to citizens. They use a political economy framework to support their rationality, which is quite accepted by most of the political science and social science community worldwide. Focusing on global processes of aging populations, migration, and globalization, they suggest that we are witnessing a deterioration of the financial system and the welfare state benefits as known today. In their view, combined forces of demographic change and globalization will make it impossible for the welfare state to maintain itself at its present level, that is, to continuously increase services to citizens and increase public expectations. As the authors argue, in much of the developed world, the proportion of the population aged 60 and over is expected to rise dramatically over the coming years – from 35% in 2000 to a projected 66% in 2050 in the European Union and from 27% to 47% in the United States – which may necessitate higher tax burdens and greater public debt to maintain national pension systems at current levels. The migration of unskilled workers produces additional strains on welfare state financing because such migrants typically receive benefits that exceed what they pay in taxes. Moreover, higher capital taxation, which could potentially be used to finance welfare benefits, is made unlikely by international tax competition brought about by globalization of the capital market. Their conclusion is simple: the political pressure from both aging and migrant populations indirectly generates political processes that favor trimming

rather than expanding the welfare state. The combined pressures of aging, migration, and globalization will shift the balance of political power and generate public support from the majority of the voting population for cutting back traditional welfare state benefits.

## Bureaucracy, Democracy, and Citizens' Expectations

Ironically, as the welfare state and its bureaucratic power have been declining, the public has been increasing its demands for an improved quality of life and increased political freedom. The economic growth in modern democracies has a general positive effect on our lives. However, with this progress comes bottom-up pressure on the state to meet greater and more challenging goals. While this is a normal and expected process, it still creates a gap between expectations and reality that can never be bridged and gives rise to a serious reason for mistrust in government. Despite the power of bureaucracy, law, and authority (and some would also say control over resources and budgets), governments are in fact in an inferior situation compared with citizens. Whereas citizens' demands of governments may be justified and natural, the response of governments to such democratic bottom-up pressures poses many dilemmas. First, there is the normative, ethical, and ideological question of "should we meet the demands"? Then comes the practical, economic question of "can we meet the demands"? Finally, there is the technical question of "who will meet the demands"? Unsurprisingly, and in accordance with the main approaches of the disciplines defined earlier in this book as nation building, the answers come from three different sources. The normative question of "should we" must look to the sociopolitical framework of ideology and ethics for an answer. The practical question of "can we" relates to economic resources and the availability of budgets. Finally, the technical question of "who will" must be answered within the organizational, managerial, and administrative framework.

Moreover, as customers of public services, citizens tend to generalize their attitudes toward decision makers and public institutions as well as toward any specific person whom they encounter in such agencies. Yet most surprisingly, in many modern democracies the public expresses a great deal of dissatisfaction with public administration. Studies conducted in different countries, using various means and methods, repeatedly conclude that in general, the public trust in government and its administrative branches is low, that people are usually dissatisfied with public services (Nye et al. 1997, pp. 1–18), and that many times the level of government responsiveness is poor (Vigoda-Gadot 2009). Modern public administration thus encourages the use of satisfaction measures as part of performance evaluations both inside public agencies and around them (e.g., Swindell and Kelly 2000). It should also be noted that this strategy has been adopted despite some limitations it has and some criticism it needs to address.

The relationship between political trust and economic indicators of performance and citizens–clients' satisfaction is also elusive. King and Stivers describe it as the "antigovernment era" and state clearly, in the introduction to their book, that: "Over 200 years American citizens have tended to tolerate government rather than to support it with enthusiasm. Yet, in recent decades, distaste for government seems to have deepened" (1998, p. 3). For example, Americans' trust in their government dropped in the late 1960s (Nye et al. 1997) despite the economic stability during that time period. Many American scholars are similarly worried about the declining trend in Americans' trust in public institutions that had been briefly renewed during the 1990s. Neither stability in foreign affairs (the end of the Cold War) nor economic strength was enough to shore up Americans' trust in governmental institutions. Nevertheless, there have been some fluctuations in public trust, such as during the period after the terror attack of September 11th, which dramatically increased the level of trust in the government. Overall, however, the perception of government and the bureaucratic system in America is becoming negative over time and expresses

a sense of mistrust or even paranoia about government (King and Stivers 1998, p. 5).

## How Bureaucracy and Democracy Affect Governability in a Global World

The discontent in modern nations, however, also arises from the immense worldwide transformations in culture, politics, technology, and demographics. Since the 1990s, this issue has been discussed extensively in the literature on governance and administration (i.e., Giddens 1990). Globalization as both a problem and a challenge to modern nations' democracy and bureaucracy is widely reviewed and exemplified in a 33 nations study by Raadschelders and Vigoda-Gadot (2015). In the modern world, governing in the twilight zone of bureaucratic versus democratic realms is subject to sociocultural, political, and technological transformations. But how exactly they interact?

Sociocultural Transformations and GovernabilityMany of the current problems of governability in the developed, but also in the less developed world, are strongly affected by social and cultural changes in the structure of nations and in the lifestyle of our societies. Sociodemographic transformations such as the changing nature of populations in demographic terms (e.g., the need to handle the pressures of mass immigration from less developed countries, to deal with elderly populations, change of careers and the nature of jobs, greater demand for education and knowledge), the effect of the media revolution, the time and energy citizens tend to spend on activities that are not directly related to the production of goods and services (e.g., leisure time, volunteering, and work for the community) have all changed the world in which we live. However, there are also influential cultural dynamics that may affect governability such as the almost unrestricted flow of norms and values among nations and societies and the liberal jargon of the modernized democratic society that permits behaviors and new types of lifestyles that were unacceptable in the past. Moreover, the sociocultural revolution facing many states is affected by changes in other societies and cultures and by the rapid and almost unrestricted flow of knowledge and information from one part of the world to the other.

These are all challenges to modern governability, to bureaucratic and to the democratic systems we all live in. They simply set new goals for policies and create new problems with which governments of the past had not dealt in any way. First, when the structure and type of populations is in flux, governments need to respond by adjusting their policies and goals to the new audience. The change in the structure of society, in the demographic characteristics of age, health, aspirations, and urbanization, calls for a variety of responses on the part of governments and greater flexibility of their mechanisms. These are all goals that are difficult to realize, as in any other organization that loses its old clients and needs to adjust to a new market. The only difference here is that governability is expected to answer our needs and demands as citizens in all aspects of our lives, not merely one "market" or another. In addition, given the massive change in cultures, governability is facing growing levels of uncertainty and pressures to do things differently and according to new norms and values. Governments operate within the framework of a set of values. When those values change, the attitude of officials and the policies they promote must change as well, which is a not simple task, to say the least. Globalization adds yet another issue by forcing governments to operate in an environment that is constantly in flux, much like changing the tires on a car that never stops moving. When one policy in a specific field is proved successful (or unsuccessful) in one nation, other nations are often tempted to try it, sometimes with disastrous consequences. While we can learn a great deal from policies implemented in other states or cultures, we must recognize that every culture functions in a unique context. Ideas usually cannot be imported wholesale to another culture without some adjustments.

Political Transformations and Governability Clearly, governability in the modern bureaucratic and democratic sphere is also affected by political changes across the globe and in the internal arena

of each state and nation. In fact, politics and governability are quite synonymous in their meaning, as the political sphere is the place where governments work and their policies are implemented. Furthermore, the legitimacy of governments is based on political and judicial arrangements that are acceptable in a given state, subject to the very clear set of bureaucratic and democratic values. Therefore, when the political arena is in turmoil, governability is ultimately affected.

While the example of the immense changes in Eastern Europe as it transitioned toward democracy (or in other states in Asia or Africa that have experienced political transformations in recent years) springs to mind, our discussion focuses more on the political transformations *within* the democratic sphere. For example, in a parliamentary democracy, the capacity to govern is frequently determined by the balance among the parties. When electoral balance clearly gives one party (or a small number of parties) the mandate to rule and shape public policy, governability is much stronger than when more parties are involved in the process of governing. This point is simple and self-evident. However, reality is much more complicated and does not allow interpretations of governability merely based on electoral parameters. In other words, the balance of a coalition is only one aspect of the capacity to govern and the capacity to balance bureaucratic and democratic values. The power of governments is also determined by other factors in political life such as the type of political leadership and the personality of the political cadre of leaders, the presidents, the prime minister, or the chancellor. Hence, political stability is not just a substitute for the power of coalitions. Political disorder and problems of governability can also arise when citizens make greater demands of the government and changing events pit the public against the government, either on a temporary or continuous basis. When the political and bureaucratic order is challenged by contentious decisions of the political leadership, by its moral standing as a group, by the individual moral standing of its members, or by worldwide trends that force greater attention to urgent threats (e.g., environmental pressures, security threats, and problems of terrorism), the capacity to govern is affected as well. It seems that, as in many conventional organizations, optimal governability may be attained in times of peace and stability for the people and the leadership. Alternatively, in more turbulent times, governability becomes more and more subject to environmental changes and to the political transformations that create new rules for both those who are expected to govern and to those who are affected by such governability.

Technological Transformations and Governability Governability also is subject to the greatest revolution of recent years, the technological revolution in computers, information systems, communications, and media. Today, governments have greater access to their citizens than at any time in previous history. Similarly, citizens can interact with governmental services in a much more intensive and dynamic manner. Therefore, governments have more influence on the people, but the people have much more input into governmental decisions through a variety of means, methods, and technologies (e.g., access to data sources, involvement in decision-making, the actions of pressure groups, the criticism and advocacy of policy plans, and so on). Buss et al. (2006) describe the new approaches and mechanisms for modernizing democracy in times of greater change and the sophistication of bureaucracy and technology. They suggest that governability in the mass technological revolution era will necessitate not only new techniques for innovation in citizens' participation but also a shift in our collective understanding about the role of governments and citizens in building our nations. This shift will bring governments and their activities closer to the public. While this shift will make the governments' actions more open to criticism, it should also increase the number of innovative ideas for change. Information and knowledge will flow much faster and more broadly, allowing more responsive governance on one hand, but also demanding more participation by citizens and their integration into the actions of governance. Thus, in several ways the capacity to govern is enhanced by using the technological interfaces that modern society offers, but its boundaries

and fields of responsibility expand, and citizens are called upon to increase their role in the process of governance.

## Bureaucracy and Democracy Under the Information Age Revolution: E-democracy and E-bureaucracy in Modern States

Technological transformations, the information age revolution, and the development of new tools, methods, and rationale for e-democracy (taking part in the democratic process by electronic means) and e-bureaucracy (taking part in the bureaucratic process by electronic means) are a fact in our lives. They affect the nature of the modern state and governability. The modern state is subject to the greatest revolution of recent years, the technological revolution in computers, information systems, communications, and media. Today, governments have greater access to their citizens than at any time in previous history. The opposite line of access – from citizens to government – has changes as well but not in the same scope and intensity as many would expect or anticipate. Nevertheless, citizens can interact with bureaucracy and with governmental services in a much more intensive and dynamic manner.

As a result, governments have more influence on the people, and the people have more input into governmental decisions through a variety of means, methods, and technologies (e.g., access to data sources, involvement in decision-making, the actions of pressure groups, the criticism and advocacy of policy plans, and so on). Buss et al. (2006) describe the new approaches and mechanisms for modernizing democracy in turbulent times of greater change and the sophistication of bureaucracy and technology. They suggest that governability in the mass technological revolution era will necessitate not only new techniques for innovation in citizens' participation but also a shift in our collective understanding about the role of governments and citizens in building our nations. This shift will bring governments and their activities closer to the public. While this shift will make the governments' actions more open to criticism, it should also increase the number of innovative ideas for change. Information and knowledge will flow much faster and more broadly, allowing more responsive governance on one hand, but also demanding more participation by citizens and their integration into the actions of governance. Thus, in several ways the capacity to govern in the modern state is enhanced by using the technological interfaces that modern society offers, but its boundaries and fields of responsibility expand, and citizens are called upon to increase their role in the process of governance.

Buss et al. (2006) also present a varied collection of essays on citizens' participation in modern democracy in the age of information and technology. They try to point to the nexus between those who make and implement public policy and those affected by it. The era of technology mandates changes in policy agenda designed to increase citizens' participation; community learning and collaboration; strategies for greater accountability in developing countries; new methods for improving participation, such as focus groups, surveys, workshops, e-governance, and other technology-supported ideas for citizens' involvement; and simulation and decision support technologies for citizens' engagement in policy making and in policy implementation. A variety of players and stakeholders struggle with new demands for the authentic involvement of citizens in forming the institutions that affect their lives and their quality of life. The echo of this trend is heard in many fields such as environmental projects, transportation, planning and development, welfare policies, healthcare, crime prevention, and other governmental initiatives that may benefit from input by the public prior to implementation or even planning.

However, when we consider democratic and bureaucratic changes in the era of technology, we must pay more attention to the role of modern lifestyles in our societies. Our modern lifestyles hinder many efforts to increase participation and thus also stand between citizens and governments in the form of growing mutual mistrust. For

example, even with highly sophisticated technology, computer-based voting systems, and advanced techniques for involving citizens in policy making, the average individual will still avoid involvement when other, more pressing issues exist. Our modern lifestyle urges us to devote more time to personal individualistic issues such as providing for our families and saving time and energy for leisure activities. In a marketplace society where welfare networks are weakening and solidarity arises only in the face of governments' inability to govern and provide services to the people, why would the average person devote time to saving the government from its own self-defeating decisions? This interesting question should be mentioned, even if it is not answered in the discourse about participation and involvement in modern society. In many respects, not much has changed in the "civic society" of 50 years ago. However, enough has changed to conclude that we all have less time to invest in collective efforts targeted at making our life better, even in times of greater access to the state decisions and actions with e-democracy and with e-bureaucracy. This is an ironic conclusion but one that certainly seems to be true. Thus, in some respects, the good will of active citizenship, by individuals and by government, is frequently diminished in the face of mass media, instant information, and the generally hectic lifestyle of the twenty-first century.

Finally, citizens' participation in political and administrative dynamics (e-democracy and e-bureaucracy) is a cornerstone of the modern state, even in times of global changes and transformations in management style, technology, and knowledge structures. Whereas such participation may be classified as part of the idea of civism (i.e., Box 1998; Fredrickson 1982; King and Stivers 1998), we believe it better suits what Fox and Miller (1996) describe as the "discourse theory" of public administration. This theory seeks to mediate the two conventional doctrines of public administration: institutionalism/constitutionalism and communitarianism/civism. It is a third voice, one that adheres well with the seminal works of Giddens (1990) about the third way of governance. It emphasizes the authentic contribution of citizens to their states, communities, and fellow citizens that will endure in the years to come, even if its form and structure change. At the same time, it urges governments to develop a direct link to communities and to develop an effective "discourse" with citizens. Just as e-democracy is dynamic and changes its face over time, so too do the types and methods of participation constantly transform and reinvent themselves through the actions of both citizens and governments. Therefore, people's attitudes and behaviors in a democracy must be studied with the best tools that science can offer. Using T.H. Marshall (1950) typology, participation is the less obvious role of citizens in modern democracies. Beyond obedience and trust or loyalty, participation is the active part of citizenship and definitely a major component of good citizenship behavior that is so essential in the modern state, especially in turbulent times. The discourse approach also calls for innovative mechanisms that can bring the public closer to decision-making processes and encourage the genuine involvement of individuals in setting the policies and strategies of modern states and nations.

## Conclusions

Open democracies are strongly based on citizens' legitimacy. Legitimacy is reflected by mutual trust of players. There are several such types of trust in the democratic realm. First, public institutions need to fulfill their core duty of providing services to the people. In order to do this they need to develop and maintain professional staffs, methods, and tools that increase their responsiveness to their citizens. In other words, they need a strong and constructive bureaucracy that delivers. Second, citizens must indicate that they are satisfied with these bureaucratic institutions and with the public services they offer, as this satisfaction is the prime indicator of a bureaucracy that is functioning effectively. Third, and most important, such performance and satisfaction need to be in line with peoples' political attitudes toward

governance, with aspirations for humanistic rights and democratic values, and especially with citizens' trust in the government.

Building stronger democracies in a global world relies on more effective bureaucracies that struggle rapid changes in the technological and communicative arenas. But the stronger the bureaucracy gets, the greater is the threat on and challenge for democratic values. This paradox has been the soul of good governance since early days of modern states is far from reconciliation. Most presumably, it is here to stay and even intensify in view of greater global changes of greater technological power, mass communication, and ultra-fast transfer of ideas, information, and knowledge between countries, continents, and people. In the postmodern era of extensive globalization and progress in the welfare state aspirations, much more balance can and should be found between bureaucracy and democracy. After all, the stronger nations get the more effective bureaucracy, democracy, and their interaction should be.

# Bureaucracy and Economic Growth

Alexander Libman
Ludwig-Maximilians-University, Munich, Germany

## Synonyms

Bureaucracy and economic development; Bureaucracy and economic performance; Public administration and economic development; Public administration and economic performance

## Definition

Bureaucracy: the body of nonelected officials involved in public administration (adjusted from: Merriam-Webster n.d.)
Economic growth: quantitative expansion of the national economy over time, either through resource accumulation or through improvements in productivity, typically measured through the growth of the gross domestic product (adjusted from: Soubbotina 2004).

## Introduction

Governmental economic policy is, without doubt, one of the major factors influencing economic growth. However, the growth performance depends not only on *what* policy measures the government decides to implement but also on *how* these policies are implemented – and therefore, is influenced by the behavior of the bureaucracy. Inefficient and poorly functioning bureaucracy can undermine even the most insightful and reasonable policy measures; flexible adjustment by bureaucrats can overcome the rigidity of the political decisions, if the latter ignore the needs of economic growth. The available empirical evidence on the impact of bureaucracy on growth is unfortunately limited. The only research question, which received substantial attention in the scholarly studies, is the impact of corruption (as one of the characteristics of bureaucracy) on growth. Other aspects of how bureaucracies operate may have an equally (or more) important influence on the economic performance of individual countries – but the amount of empirical evidence to corroborate or to refute this claim is much smaller.

This essay provides a survey of the key arguments of the literature investigating the influence of bureaucracy on economic growth, describes the results reached so far, as well as avenues for future research. It focuses in particular on quantitative large-N studies in this field, at the same time attempting to cover various literatures in different social science disciplines – from economics over political science to sociology and public administration.

Generally speaking, there are two empirical characteristics of bureaucracies, which could be relevant from the point of view of this essay's discussion. First, the effect of bureaucracy on economic growth is likely to depend on the *quality of bureaucracy*, which, in turn, is a function of the formal and informal (e.g., the ethos of the civil servants) incentives bureaucrats are subject to. Second, the impact can be driven by the *size* of the bureaucracy, i.e., the number of the public officials. Hence, the paper systematically discusses each of these aspects one after another.

## The Quality of Bureaucracy

The research on how the quality of bureaucracy affects economic growth belongs to the general broad literature on the impact of institutions and governance on economic performance. There are hundreds or even thousands of studies dealing with this topic, but many of them measure institutions in a way capturing both characteristics of bureaucracy (e.g., corruption) and other features of the institutional environment – i.e., the legal characteristics or the political system – and occasionally even public policies (e.g., taxation). Thus, their findings are less relevant for the discussion of this essay. Several studies, however,

specifically concentrate on the impact of bureaucracy on growth. These papers attempt to single out particular characteristics of the bureaucracy, which make it better able to support growth, and to devise quantitative measures of these characteristics.

From the theoretical perspective, it is probably reasonable to go back to the early literature discussing how bureaucracy can serve economic performance. The classical work of Max Weber identified a number of characteristics of the government administration making it able to support growth. Weber especially focuses on two features: the recruitment of bureaucracy should be based on meritocratic principles rather than political loyalties or personal relations (which also implies a separation of the public administration from politics) and bureaucrats should be protected by long-term rather than short-term contracts. This should both ensure the competence of the bureaucrats and their motivation to focus on long-term goals, which are crucial, e.g., if the task of the administration is to provide public goods and organize financing for long-term investments. Evans and Rauch (1999) in a highly influential paper construct an index of the "Weberianness" of the national bureaucracies of 35 developing countries and indeed show that states with bureaucracy more resembling the Weberian ideas are characterized by higher growth rates. A further study by the same authors indicates that Weberian bureaucracies exhibit several features associated with good governance, in particular low level of corruption.

This approach is, however, in spite of its advantages associated with clear links to the theory, rather exceptional in the existing research. A much more frequent approach of studying how bureaucracy affects economic growth looks not at the bureaucratic organization and incentives as such but rather on the behavior of bureaucrats under these incentives and organization structures – in particular at the level of corruption. The influence of corruption on the economic performance is a highly controversial topic. On the one hand, it appears intuitive that corruption should reduce economic growth. Corruption acts as another tax on the private investors and businesses, making their operations more expensive (and in extreme case impossible). Furthermore, corruption limits competition by providing privileges to a small group of firms or individuals having access to bureaucrats – in this respect the "corruption tax" is more damaging than equivalent taxation burden. Corruption is harmful also because contracts between businesses and corrupt officials are not enforceable: officials can at any time request additional payments, and, anticipating it, business will be cautious while undertaking long-term expensive investment projects. At the same time, since Leff (1964), corruption is also considered a factor potentially improving economic performance. It happens if the quality of *economic policy* as such is very low: corrupt bureaucrats will provide larger opportunities to private business and individuals to avoid the formal (inefficient) requirements of the state, e.g., by speeding up the procedures and escaping inefficient regulations. As a result, the opportunities for growth will increase – in spite of predatory or at least inefficient governmental policies. Furthermore, corruption incentivizes bureaucrats; in extreme case, it leads to a competition among bureaucracies (e.g., in individual regions of a federal state), resulting into improvement of their performance.

This "grease the wheel" corruption argument has been put to a test in numerous empirical papers (for a survey, see Bose 2010). The majority of studies seem to confirm that corruption has a negative effect on growth. There are, however, also some contributions, which suggest that at least under certain circumstances corruption can be beneficial for growth. Meon and Weill (2010), for example, suggest that corruption improves efficiency in countries with extremely poor quality of economic institutions. One has to point out that the measures of corruption used in the empirical research rarely clearly separate bureaucratic corruption from political corruption. The arguments of the "grease the wheel" corruption specifically apply to bureaucratic corruption; if corruption persists at the political level (i.e., where the inefficient and contradictory laws bureaucratic corruption is supposed to overcome are created in the first place), there are no reasons

to expect corruption to strengthen economic performance of a country. Furthermore, many modes of corruption are country specific and therefore extremely difficult to compare.

Finally, there exists a relatively small group of papers, which, while intending to study bureaucracy in particular, use broader proxies of bureaucratic quality and link them to growth. Typically, these proxies have weaker theoretical foundation than the Weberian properties of bureaucracies and are less focused on particular aspects of the bureaucratic behavior than the measures of corruption. For example, the International Country Risk Guide (ICRG) dataset, a popular source of data on the quality of institutions, includes a component measuring the "bureaucratic quality" and capturing, broadly speaking, the level of independence and competence of bureaucrats. The Business Environment Risk Intelligence (BERI) dataset captures the level of bureaucratic delays in different countries. Some of the components of the Doing Business dataset can also be seen as proxies of bureaucratic quality. A certain disadvantage of these proxies is that, to some extent, they make the predictions about the effect of bureaucracy on growth self-fulfilling: one defines good bureaucracy as a bureaucracy acting in a way supporting business activity and growth. Most papers in this area of research document that the quality of bureaucracy has a positive effect on growth. Some papers use even broader measures to study the impact of bureaucracy on growth: Tsanana et al. (2016) argue that the index of economic freedom can be applied for this purpose. They also suggest that high quality of bureaucracy improves economic growth: however, in this case separating the effect of government policies from the effect of their implementation by bureaucrats is very difficult.

## The Size of Bureaucracy

Studies of how the size of bureaucracy affects the economic growth are even more limited than those looking at the quality of bureaucracy. To some extent, it is an outcome of the poor quality of data. While there is comparable information on the size of public sector employment, singling out bureaucrats (i.e., government officials involved in the functioning of the public administration, as opposed to the employees of the public sector in general) in different countries in a comparative perspective is a very difficult task. The definition and the status of the public service differ from country to country, and the assignment of particular publicly funded positions to the bureaucracy or merely to the public sector employment (or even to private or semiprivate contractors) is country specific as well. Employees of public schools, universities, healthcare facilities, railroads, or utility companies can both have a status of civil servants or merely work for a government-owned entity under the normal labor law requirements. In many cases, granting the status of a civil servant to some groups of state employees is an outcome of political debates and lobbying. It creates a further problem: those identified as "bureaucrats" in some of the countries may be engaged in occupations different from those theory of bureaucracy focuses at (i.e., public administration) and therefore may be subject to different stimuli and incentives than those governing the behavior of the bureaucracy in the theoretical work. It makes testing the theory regarding the influence of the size of bureaucracy on growth even more difficult.

Still, from the theoretical perspective, the size of the bureaucracy is likely to be an important factor influencing economic growth for two reasons: because it affects the costs necessary for sustaining the bureaucracy and because it can be seen as a proxy for capacity and power of bureaucracy. The most obvious factor how size of bureaucracy should matter for growth is associated with the fact that maintaining large and sophisticated civil service is frequently quite expensive. As a result, the government is forced to increase the burden of taxation, which, in turn, reduces the ability of the national economy to grow. It is unclear, however, whether the costs of even a very large bureaucracy can reach the level when they indeed have a macroeconomic impact. The share of compensation of government employees in the GDP is indeed substantial in some of the countries (especially in those with developed welfare state, e.g., in the European

Nordic states, France, or Greece, as well as in some post-Socialist states), but, as mentioned, these data cover various groups of state employees – and the bureaucrats in the strict sense constitute only a minority of it. Therefore, the second reason – the size of bureaucracy as a proxy for its power and capacity – is likely to be more important. On the one hand, particularly the public choice literature points out that the crucial goal of the bureaucracy is to maximize the discretionary budget available at its disposal. If bureaucracies are successful in achieving this goal, they are likely to expand, particularly increasing the size of their personnel. At the same time, powerful bureaucracies face lower constraints in terms of rent seeking. Rent seeking, in turn, results in lower economic growth. As a result, large size of the bureaucracy should be negatively correlated with growth. On the other hand, in many cases – especially in developing countries – the size of the bureaucratic staff is simply insufficient to implement the tasks assigned to the bureaucracy in an efficient and expedient manner. Then hiring new civil servants should solve some of these problems – e.g., expedite granting business permits, more effectively react on complaints from the private sector, etc. Then the size of bureaucracy should be positively correlated with growth.

The existing research on the link between the size of bureaucracy and growth frequently focuses on using subnational variation of the bureaucratic apparatus rather than the national one. The advantage of subnational data is that, first, they reduce the impact of unobserved heterogeneity and, second, allow the comparison of bureaucracies across different observations of the sample – while internationally, as mentioned, the precise definition of what constitutes a bureaucracy could vary substantially, within a single country regions are most likely to use similar approaches to separating the general public sector employment from the bureaucracy. In particular, several studies use the case of the Russian Federation. Russia is indeed a suitable laboratory for cross-regional analysis: it consists of a large number of regions characterized by an enormous heterogeneity in terms of their economic, social, and political characteristics. Furthermore, its statistical agencies publish detailed information on the size of bureaucracies of each region, clearly distinguishing between the bureaucrats and other state employees. The findings of the literature are, however, inconclusive. Libman (2012) investigates how the size of bureaucracy affects economic growth and finds a very strong and negative effect. For Russia, which has a century-old tradition of powerful, inefficient, and corrupt bureaucracy, it seems to be compelling. Russia in the 2000s, in fact, organized its bureaucracy based on principles precisely contradicting the Weberian idea: Russian bureaucrats have short-term employment contracts tied to strict quantitative performance criteria, and public officials are selected based on personal ties rather than on meritocratic criteria. At the same time, Brown et al. (2009) come to a different conclusion. They look at the variation in the impact of privatization on firm productivity across regions of Russia and find that the increase of productivity is more pronounced in regions with large bureaucracies, because the institutional environment after privatization in this case is better. Their argument is based on the idea that in regions with insufficiently large bureaucracies the state capacity is also insufficient to support the private business, and the Russian bureaucracy is indeed relatively small as compared to the country's population.

Thus, even in the specific country case of Russia with somewhat better data available to the researchers, there is no clear evidence on the role the size of the bureaucracy plays. Certainly, generalizing Russian findings to other countries – both developed countries with effective and much better organized and less corrupt bureaucracies and developing countries with very weak control over bureaucrats and poor professionalization and training of the civil servants – is very difficult. However, Russian results clearly suggest that the size of bureaucracy is a variable, which matters for the economic performance – which makes further research concentrating on this characteristic particularly important.

In terms of the cross-country evidence, the investigation of Goldsmith (1999) is almost unique in studying the effect of the size of bureaucracy on economic growth. He focuses on African states, which are frequently described as examples of overgrown predatory bureaucracies, and concludes that this frequent stereotype is not supported by the empirical evidence – on the contrary, in Africa large bureaucracy is occasionally characterized by higher level of economic well-being. This result is driven by the lack of state capacity, which is one of the key problems for Africa. At the same time, the predatory behavior of bureaucracies in Africa should not be easily dismissed. In his provocative paper, Leeson (2007) looks at Somalia and concludes that after the collapse of the government the economic situation in this country is by no way much worse than in other African states and in some aspects even improved – because even anarchy turned out to be a better economic regime than the repressive and corrupt state of Siad Barre preceding the Somalian civil war. Possibly, in case of the least developed countries, the effects of bureaucracy on growth is associated with a trade-off – increasing state capacity comes at a cost of increasing government predation.

Finally, Ayal and Karras (1996) link the discussion of the quality of bureaucracy and of its size by constructing what they refer to as a "bureaucracy inefficiency ratio": defined as the ratio of the share of public employment to the share of government consumption in the GDP. The intuition behind the ratio is to compare the productivity of a government employee vis-à-vis an employee of the public sector: how many employees are necessary to make a particular contribution to GDP. The problems with this indicator are, however, not only empirical (Ayal and Karras do not separate government employment from bureaucracy in the narrow sense) but also conceptual. First, the quantitative indicator of the government consumption captures only some of the contributions of the bureaucracy to economic growth – e.g., it fails to account for activities of the bureaucracy associated with upholding law and protecting property rights and contracts and thus making *private* businesses more effective. Second, a direct comparison of the public and the private sectors can be misleading – in the public sector there is no market pricing mechanism, and therefore the evaluation of the public goods produced by the government in comparison to the privately produced is difficult.

## Research Challenges

While investigating the link between bureaucracy and economic growth, the empirical large-N studies typically face a number of challenges. Some of them relate to the methodology of research; others concern the research topics, which are promising in terms of new interesting results, but have so far received only limited scholarly attention. In what follows, the paper discusses these challenges and opportunities.

### Endogeneity and Methodology of Large-N Studies

As it is typically the case in the empirical political economy research, the studies on the impact of bureaucracy on economic growth are plagued by severe problems of endogeneity. Intuitively, it is not clear whether countries with high level of economic growth are better capable of creating more efficient bureaucracies or whether bureaucracy (as it has been implicitly stipulated in this paper) supports growth. In the same way, economic growth could make it feasible for countries to sustain larger bureaucracies or to finance training programs for bureaucrats. Furthermore, omitted variable bias can also play an important role: the quality of bureaucracy can be correlated with other (unobserved) characteristics of a country affecting its growth performance. The issue of endogeneity has been discussed in the general literature investigating the link between institutions and growth, but much less frequently in the studies of the effect of bureaucracy on growth. The main problem is, on the one hand, the lack of reliable proxies of the bureaucratic capacity and quality and, on the other hand, extreme difficulties associated with finding plausible identification

strategies. One particularly interesting and promising approach could be associated with looking at the historical roots of the differences in the organization, motivation, and functioning of bureaucracies. In spite of major historical discontinuities and political changes, bureaucracies persevere: while using a different ideological language, they often replicate the old patterns of behavior. Bureaucratic legacies can be traced back to the type, size, and organization of the colonial administration for many developing countries, to the bureaucracies of the pre-World War I empires (Germany, Austria-Hungary, Ottoman, and Russian empires) for the countries of Central and Eastern Europe, to pre-colonial states and the level of their development (e.g., in Africa), etc. Investigating historical trajectories of bureaucratic development therefore becomes a potentially fruitful avenue to improve identification in the empirical analyses of the link between bureaucracy and growth.

### Bureaucracy and Political Regimes

Bureaucracy cannot be studied in isolation from other aspects of the social and political system: thus, its impact most likely is conditional on other characteristics of a country or a polity. From this point of view, one of the most interesting and hotly debated topics is how the influence of bureaucracies on economic growth varies in countries with different political regimes. The successful economic development of China in the last two decades triggered a large debate about the importance of governance vs. democracy for economic development. From this point of view, improving governance practices and bureaucracies could to some extent compensate for typical deficits a nondemocratic regime has in terms of supporting economic growth: for example, bureaucracies can (in most cases except highly politically sensitive ones) protect property rights and enforce contracts, thus encouraging private investments and business activity. Since at least early stage of democratization is likely to be associated with a massive increase of populist policy making (with potentially harmful consequences for growth), such a "bureaucratic" authoritarian regime could eventually turn out to be a better development alternative than an early attempt of a democratic regime transition. The optimal trajectory of economic development is then hypothesized to be the following: from creating a strong and efficient bureaucracy to high growth rates and ultimately to democratization when certain development goals have been achieved.

Certainly, the major question remains, what makes nondemocratic regimes able to create a functioning and efficient bureaucracy. Politicians in a nondemocracy are heavily involved in rent seeking and thus not necessarily interested in improving the quality of governance; providing credible commitments to bureaucrats (e.g., ensuring their long-term employment – necessary in the Weberian bureaucracy concept) is extremely hard due to the absence of political constraints, and the separation of bureaucracy and politics generally is very difficult. Besides, studies of nondemocracies in particular make it very hard to understand which characteristics of bureaucracy support economic growth – potentially, a "good" bureaucracy in a nondemocracy is different from a "good" bureaucracy elsewhere. China, for example, is by no means an example of an independent, meritocratic, and not corrupt public service – but its bureaucracy exhibits certain features (in particular, strict connection of the promotion of a bureaucrat and of growth performance of jurisdictions an official is responsible to), which make it able to encourage bureaucrats to support growth-enhancing policies.

Some studies indeed provide empirical evidence that high-quality bureaucracies can encourage economic growth in authoritarian regimes (e.g., Jamali et al. 2007). However, in most cases the definition of the bureaucratic quality applied in this research is extremely generic: thus, one cannot be sure whether the study singles out the effect of bureaucracy or, generally speaking, other aspects of good governance a nondemocratic regime can have (e.g., better codification of law, institutionalization of politics, or involvement of various groups in political decision-making process). Again, the problem faced by this literature

is the lack of comparable quantitative measures of the quality of bureaucracies for a sufficiently large sample of countries. Hanson (2015) offers an interesting discussion of state capacity and democracy, showing that both can improve the quality of public goods provision, but do not mutually reinforce each other. His quantitative proxies of state capacity measure the very fundamental issues of organization of bureaucracy: the length of the existence of statehood and the frequency with which census is conducted. Studying the interplay between bureaucracy and political regimes, one is also interested in a more nuanced view of how bureaucratic systems and performance can vary across countries, which already have sufficient state capacity. Overall, there exists large potential for further empirical research on the topic.

### Organization of Bureaucracy

Finally, a topic, which received very little attention in the studies of the link between bureaucracy and growth, is how the organization of the bureaucratic machinery affects the economic development. Bureaucracies are more fragmented in some countries than in others, are different in terms of the use of horizontal vs. hierarchical communication, have different assignments of functions to different agencies, have different structures of control and of promotion, use different remuneration systems for civil servants, etc. Do these differences affect the way bureaucracy provides public goods and regulation and, in turn, influences economic growth? In the actual policy making and design of bureaucracies, this topic is probably the most frequently discussed; there are also numerous studies investigating the comparative effectiveness and efficiency of different organizational designs. However, large-N studies, which would systematically examine the differences across various countries of the world (or various regions of a single country) in terms of the link between the organization of bureaucracy and the economic growth, do not exist yet. Again, it creates an important research gap and an attractive field for future research.

## Conclusion

The empirical evidence seems to support the claim that good bureaucracy provides an important contribution to economic growth and, even more, is able to compensate for some of the other deficits of institutional environment (e.g., lack of democracy). However, the proxies used in the literature are mostly extremely generic and hence may be insufficient to identify the specific effect of bureaucracy as opposed to other aspects of institutional environment; because of the problems of endogeneity, it is not entirely clear whether correlations indeed represent causal effects.

Furthermore, if one looks at the effects of bureaucratic corruption and of the size of bureaucracy on growth, one finds contradictory theoretical predictions empirical results in the extant studies. The literature generally leans toward supporting the conjecture that corruption has a negative influence on growth, but some studies provide evidence for the "grease the wheels" corruption hypothesis as well. Large bureaucracies can be both harmful for growth by increasing costs of public administration and being associated with larger rent seeking and favorable for growth by improving state capacity.

The literature on the link between bureaucracy and economic growth still provides numerous gaps and opportunities for future research. They are associated in particular with improving the quality of data more specifically capturing theoretically relevant aspects of the functioning of bureaucracy and searching for new identification strategies. Furthermore, a mostly neglected topic is how different models of organization of bureaucracy influence growth – the substantial variation between individual countries (and regions of large federal states) in this respect could become an attractive avenue for further studies.

# Bureaucracy and Efficiency

Taptuk Emre Erkoc
Institute for Islamic Studies, University of Vienna, Vienna, Austria

## Synonyms

Bureaucracy: Civil servants; Government officials; Public sector employees

Efficiency: Effectualness; Efficacy

## Definition

Bureaucracy: A system of administration distinguished by its clear hierarchy of authority, rigid division of labor, written and inflexible rules, regulations, and procedures, and impersonal relationships.

Efficiency: The state or quality of being efficient or able to accomplish something with the least waste of time and effort; competency in performance.

## Introduction

Rising economic inquiry on the provision of goods and services by public institutions sparked an investigative research on the efficient allocation of resources within public sector organizations (Duncombe et al. 1997; Pedraja-Chaparro et al. 2005). Whereas neoclassical assumptions on the theory of firm put forward by Coase (1937) and Alchian and Demsetz (1972) assume that a firm is always expected to operate at the efficient production frontier, unpredicted divergences from the neoclassical firm postulations attracted attentions of researchers working not only on the private firms but also on the public sector organizations (Lewis 2004; Bloom and Van Reenen 2007). In this section, the reasons behind the deviance of public sector organizations from the efficient frontier are scrutinized on the basis of the discussions around the economic theory of bureaucracy. The outline of this section is as follows: part II explores the theoretical framework for the efficiency in the public sector organizations, part III demonstrates the bureaucracy component of efficiency in the public sector, and part IV concludes.

## Efficiency in the Public Sector Organizations

Efficiency (For a comprehensive literature on the concept of efficiency in the allocation of resources, please see Erkoc (2012)) analyses of public sector organizations are often academically inspired by opposing readings on the frontiers of

state interference into the economic sphere. Although public provision of social services became a noteworthy phenomenon throughout the modern age particularly after the emergence of nation states (Rosanvallon 2000), debates on the proper function for governments in the social sphere are as long-standing as Plato's *The Republic*. The accumulated literature on this particular theme can be mainly classified into two streams as Besley (2011) points out clearly below:

> (. . .) One emphasises government in the public interest. It outlines the range of activities that government can undertake to improve the lives of its citizens. Government provides underpinnings of the market system by establishing property rights and a means of adjudication through the courts. (. . .) The logic behind this has been developed at length and provides the modern theory of state from a welfare economic point of view. At the other extreme are accounts of government seen mainly as a private interest. Government can be a focus for rent seeking in which the power to tax results in private, wasteful efforts to capture the state which then rewards the powerful at the expense of citizens at large (. . .). (Besley 2011, pp. 1–2)

In addition to the theoretical background for the efficiency in the public sector, there is a growing awareness amid the decision-makers in the governmental institutions concerning the efficient allocation of resources within public sector organizations, which resulted in an expansion in the number of academic papers (Duncombe et al. 1997). The driving factor behind this growing sensitivity among governmental bodies is highly associated with the fact that inefficiencies may "suggest that public service resources could be better used elsewhere in the economy, or that more outputs could be generated within the public services without additional resources" as well as "undermine the public's support for tax funding of public services" (Smith and Street 2005). Thus, studies assessing the efficiencies of public sector organizations are used as policy-recommendation papers together with their academic contributions as indicated by Duncombe et al. (1997).

The ultimate goal of the empirical researches on this particular area is "to measure the relative efficiency of different public organizations providing the same public service" (Pedraja-Chaparro et al. 2005). Accordingly, Pedraja-Chaparro et al. (2005) suggested two different measurement techniques. In the first technique, a number of partial performance measures are developed to comprehend the behavior of the organization. However, in the second one, a "general index" is defined to compute the efficiency of the given set of organizations. Hence, the former method specifies local efficiency scores, while the latter one refers to global efficiency indicators. The most common and methodologically well-established efficiency indicators are predominantly stemming from the second group of indicators that use a variety of methods including parametric, semi-parametric, and non-parametric models (Stone 2002).

There is a common argument in the efficiency analysis arguing that it is evidently hard to measure the efficiency performances of public sector organizations as opposed to the private companies due to the fact that public sector "produces goods that are provided either free at the point of use or at a price that is not determined by market forces" (IFS Report 2002) as well as the "non-tradable nature of goods and services" supplied by public organizations (Pedraja-Chaparro et al. 2005). Accordingly, price mechanism that is expected to ensure the efficient allocation of resources on the basis of conventional market dynamics does not function properly in the public sector. That is to say, "signaling" in the market mechanism tends to be substituted by the discretionary actions of political actors that would cause inefficiencies in the production process for the public sector organizations.

In addition to the intrinsic problems of the public sector regarding to the political manipulation on the provision of welfare services, ill-defined nature of property rights within them lead people in the public service to act in reluctant ways on the usage of resources. And accordingly "the allocation of public resources is governed by a political process which usually does not follow the price mechanism" (Kang 1997). The political and social constraints, in lieu of market based constraints, on the publicly provided goods and services result in inefficient allocation of resources as well. Besides, the lack of competition and the "monopolistic nature of public production" prevent the actors in the public sector organizations to be cautious about the efficient usage

of resources compared to their competitors in the private sector (Pedraja-Chaparro et al. 2005).

As indicated in the preceding paragraphs, outputs produced in the public sector organizations either in police, education, healthcare, and courts is questioned concerning their efficiency performances. Chong et al. (2014) claimed that the reasons behind the lower productivity and efficiency figures in public sector can be summed up as "inferior outputs, including human and physical capital, technology, and poor management". Moreover, Lewis (2004) and Bloom and Van Reenen (2007) stated that the poor public sector management is mostly motivated by lack of incentives, supervision, and monitoring. Consequently, the statements on poor management in the public sector encourage comprehensive investigation on bureaucracy that backbones the organizational structure in the public sector organizations.

The economic insights on the bureaucracy studies are mostly situated on the fundamental question exploring to what extent efficient or inefficient usage of resources are interrelated with the managerial performances of bureaucrats. Besides, these studies are largely consisted of budget size (Downs 1965; Niskanen 1971), slack maximization (Migue and Belanger 1974), and expenditure choices (Williamson 1964) models. Moreover, since Migue and Belanger (1974) extended Niskanen's (1971) assumption of technical inefficiency in the public sector by incorporating allocative inefficiency into the model, the number of empirical researches measuring both technical and allocative efficiencies of public sector organizations has boosted apparently. That is to say, the aforementioned papers on the economic theory of bureaucracy had paved the way for the current empirical researches to conduct efficiency analysis on public sector organizations.

## Bureaucracy and Efficiency in Public Institutions

Public sector employees, namely, bureaucrats, correspond to the major part of public sector discussions particularly when the efficiency in the public sector organizations is questioned. Hence, the efficient or inefficient allocation of resources to provide certain services to the public has often been examined on the basis of budget choices that are made by bureaucrats (McNutt 2002, p. 124). This part critically summarizes the fundamental insights and discussions on the bureaucracy and efficiency in the public sector.

**Preliminary Research on Bureaucracy.**
The introductory academic studies on the bureaucracy were inspired from Weber's (1947) influential work centered predominantly on German case. In his paper, Weber's first and foremost aim was to put forward certain set of ideal characteristics for each and every bureaucratic mechanism including profit-maximizing firms (McNutt 2002, p. 124). Moreover, he was also trying to create the most appropriate way of management in organizations to assure that a staff can enhance her technical competence as well as apply it to the certain practical cases. Weber's (1947) ideals for a well-functioning bureaucracy can be enumerated as "hierarchy, unity of command, specialization of labour, employment and promotion based on merit, full-time employment, decisions based on impersonal rules, the importance of documentation and a separation between the bureaucrats' work-life and private life". These aforementioned characteristics still influence modern conception of bureaucracy and stimulated the formation of vast literature in this particular area of research (Aucoin 1995, p. 157).

Following the early sociological analysis of bureaucracy introduced by Max Weber, economic insights on bureaucracy initially commenced with the works of Tullock (1965), Downs (1965), and Niskanen (1971). All three authors were aiming to figure out the modes of "relations between people within an organisation in receipt of a recurrent block of funds" (McNutt 2002, p. 124). And eventually, their theoretical conclusions formed the mainstream understanding in microeconomic research.

Downs (1965) proposed a fundamental assumption for bureaucrats by arguing that they are solely motivated by their own self-interests like any other agent in the society. Hence, rather than specifying public interests, they prefer to

maximize their utilities while they are working in the bureau. And subsequently, he indicates that the "nonmarket orientation" for bureaucratic outputs prevents an "objective monetary measure of profitability," which results in larger bureau sizes alongside with reluctance toward efficient usage of resources. As a final point, it needs to be stated here that Downs' preliminary analysis was rather influential on the further bureaucracy analysis particularly on Niskanen's theory of bureaucracy.

### Utility-Maximizing Models of Bureaucracy

Utility-maximizing models for managerial organizations including bureaucracy has widely been used in the economics literature focusing particularly on three different pillars: (a) budget maximization, (b) slack maximization, and (c) expense preference. The following paragraphs articulate these models separately.

### Budget Maximization

Niskanen (1971) coined the budget-maximizing model for bureaucracy stating that bureaucrats are willing to increase the level of production until it reaches the largest amount of budget. The basic reason behind this attitude is that "bureaucrats do not have property rights to the fiscal residuum of the bureau" which corresponds to the difference between social costs and benefits incurred in the provision of services (Kang 1997). That is to say, bureaucrats prefer producing the goods and services above their social optimum to utilize the remaining portion with an eye to enhance their position within the institution they work in (Downs 1965; Niskanen 1971).

Niskanen (1971) developed a demand function for output of bureau by assuming that demand and cost functions have linear characteristics. And accordingly, he claimed that bureaucrat does not prefer the point where profit is being maximized but his own budget is being maximized. Thus, public institutions face a fundamental challenge to operate at the efficient frontier due to the lack of profit-maximizing target set by bureaucrats. However, the budget-maximizing model developed by Niskanen received an essential criticism from Migue and Belanger (1974) on its very assumption that public sector operates technically efficient but may not be allocatively efficient. They criticized this assumption and relax it with the statement that public sector may both be technically and allocatively inefficient and eventually established a slack-maximizing model that is discussed below.

### Slack Maximization

Migue and Belanger (1974) expanded the economic theory of bureaucracy by disproving the Niskanen's (1971) ironic approach stating that bureaucrats' only motivation is to increase the amount of budget they have, and if this is right "then, no expenses other than those contributing to productivity are incurred since these would compete with output" (Kang 1997). In contrary to the Niskanen's conclusions, they argue that bureaucrats will opt for the point on the budget line where marginal rate of substitution among the output of bureau and other expenses is equal to the slope of the budget line (Migue and Belanger 1974). Therefore, the relative prices of output and other expenses become the significant subject of analysis in lieu of maximum amount of attainable output on the budget line.

The argument between Migue and Belanger (1974) and Niskanen's (1971) models of bureaucracy is examined by Wyckoff (1990) leaning on four separate empirical predictions on the basis of "utility-based model of bureaucratic choice." The author argues, "slack-maximizing and budget-maximizing bureaucracies are similar in their response to changes in cost and in their generation of 'flypaper effects', but they differ in their responses to matching and lump-sum grants". In relation to the efficient usage of resources, budget maximization causes technical inefficiency as it leads overprovision and cost efficiency; slack maximization creates allocative inefficiency, due to under-provision, and cost inefficiency (Duncombe et al. 1997).

### Expense Preference

In addition to the budget and slack-maximizing models, Williamson (1964) initiated expense preference model to explain why bureaucrats are inclined to produce above the expected minimum cost level, which results in cost inefficiencies in

the public sector organizations. Kang (1997) argues that Williamson (1964) meant in the expense preference model, "Managers do not have a neutral attitude toward all classes of expenses. Instead some types of have positive values attached to them". Thus, so as to "enhance individual and collective objectives of managers," certain types of expenses such as staff are incurred in higher amounts even though they do not have any impact on productivity and efficiency in the organization (Kang 1997). In other words, if this is the case, cost function of a given public institution is expected to be highly correlated with labor expenses as well as staff characteristics (which causes higher labor expenses) would have an impact on the efficiency performances.

Following the arguments put forward in Williamson's (1964) paper, De Alessi (1969) reveals an inter-temporal dynamic of bureaucrat's expenditure preferences that leads the current amount of expenditures to rise above the optimum. Unlike private companies, De Alessi (1969) argues that the government favors using lower discount rates, which result in over-investment in the public sector organizations due to the overestimation of the benefits yielded from current investments. And accordingly, managers in the government institutions have an incentive to increase the amount of present investments rather than waiting for prospective ones (Kang 1997).

### Public Choice Theory and Bureaucracy

Tullock (1965) has the pioneering work on the public choice model of bureaucracy that had an obvious impact on the Niskanen's (1971) budget-maximizing assumption of bureaucrats. Prior to the Tullock's economic analysis of bureaucracy, the sociological theories were manifesting themselves in this subject inspiring from Weber's model (1947) that was reluctant to the economic behaviors of bureaucrats. According to the public choice thinkers, actors in the political sphere comprised of voters, politicians, and bureaucrats perform their acts concerning conventional free market procedure, which is also known as catallaxy. Therefore, as far as public choice theory is concerned, bureaucrats are expected to maximize their utility levels either exploiting the monetary gains or enjoying higher status in the organization (Buchanan and Tullock 1965).

Tullock's (1965) particular hypothesis is centered on the growth of bureaucracy and output of bureaus from a dynamic or inter-temporal perspective. In his research, he concluded, "through time, bureaucracy grows in size and did not remain at initial size" (McNutt 2002, p. 143). He proposed a growth function of the budget for a given bureau depending on time as follows:

$$B_{t+1} = B_t \exp(r^t) \tag{1}$$

where $B_{t+1}$ represents the budget size at time period $(t + 1)$ and $B_t$ refers to the budget size at time period t. Additionally, $r$ corresponds to the magnitude of growth in the bureaucracy. Hence, as the time passes, the budget size is expected to grow referring to the fact that relatively older public institutions would experience higher inefficiencies as compared to their younger equivalents. This model also indicates that bureaucrats are desperately keen to increase the total amount of budget allocated to their bureaus as this increases their discretionary power over certain expenses that are more preferable to them (Williamson 1964).

In the following discussions within public choice theory, Brennan and Buchanan (1980) take one step further by incorporating tax base analysis into the budgetary preferences of bureaus. To these researchers, "if a citizen expected bureaucrats to maximise their budgets, they would constrain their ability" by imposing a limit on the tax base through certain legislative attempts (McNutt 2002, pp. 145–146). Therefore, the extent of budget size is not merely contingent upon the preferences of bureaucrats but also citizenry constraints concerning the level of taxation are highly influential determinants of budget size in public sector organizations (Brennan and Buchanan 1980).

### Alternative Perspectives on Bureaucracy

Over and above the models developed to illustrate the economic underpinnings of the

theory of bureaucracy that became a mainstream reference point for the current literature, some theoretical alternatives are shown below to expand the reasoned discussions on the (in)efficient allocation of resources within public sector.

### Dunleavy's Model of Bureau Shaping

Unlike the previous papers on the bureaucracy, Dunleavy (1991) assumes that the main motivation for bureaucrats is not pecuniary gains (although they have significance) but non-pecuniary ones including "status and prestige" and the "intrinsic value of the work involved" (McNutt 2002, p. 150). To clarify this, he argues that "There is always a pecuniary parameter in bureaucrats' concerns (...). But this is unlikely to be a constraint which is surmounted relatively easily and thereafter is not very influential positively or negatively in structuring individual behaviour especially when officials are making policy decisions" (Dunleavy 1991, p. 201). Hence, bureaucrats are expected to maximize their utilities through exploiting full control to shape their bureaus rather than maximizing the sizes of their budgets.

To Dunleavy, bureaus are shaped by a number of policy decisions consisting of major internal reorganizations to promote policy work over routine activities, transformations of internal work practices, redefinition of relations with external partners to enhance policy contacts, competition with other bureau to protect the scope of interesting work, load shedding, hiving off, and contracting out functions which are seen as undesirable (Dunleavy 1991, pp. 203–204). The main conclusion derived from Dunleavy's bureau shaping model can be summed up in two propositions: "Firstly, budget maximising will be more likely in bureaus where the core budget makes up most or all of the program budget, i.e. in delivery, regulatory, taxing, trading and servicing bureaus. And secondly, other types of self-interested behaviour by senior bureaucrats will influence the activities of bureaus" (Dollery and Hamburger 1995).

### Bureaucrats and Politicians

The abovementioned arguments on the theory of bureaucracy were lacking of the relationship between bureaucrats and politicians who both choose and implement policies (Alesina and Tabellini 2007). Even though the link between these two significant players in the policy-making attracted the attentions of researchers many years ago, first economic insight belongs to Rogoff (1985) who particularly focuses on the decision-making process for monetary policy. In the related paper (1985), he claims that nonelected central banker with independent and inflation-averse characteristics would enhance social welfare.

Departing from preceding literature on the bureaucracy-politics relationship based upon principle-agent models (Schultz 2003; Besley and Ghatak 2005), Alesina and Tabellini (2007) states that "bureaucrats are preferable to politicians in technical tasks for which ability is more important than effort, or if there is large uncertainty about whether the policymaker possesses the required abilities to fulfil his task". Moreover, they conclude that the policies encompass "highly technical tasks" need to be handed over to the high-skilled public employees particularly in monetary policy, regulatory policies, and public debt management. In addition to the aforementioned statements, Alesina and Tabellini (2008) extend their arguments in their following paper with certain propositions. They reveal the fact that bureaucrats are anticipated to perform better than politicians if "the criteria for good performance can be easily described ex ante, and are stable over time (...), the policy consequences touch narrowly defined interest groups and good performance can be easily formulated and assessed in terms of efficiency."

## Conclusion

After introducing the theoretical framework on the efficiency of public sector, this section examines the economic theory of bureaucracy that is seen as the major source of inefficient allocation of resources in the public sector organizations.

Besides, alongside with the earlier Weberian (1947) and Downsian (1965) interpretation of bureaucracy, alternative perspectives on bureaucracy including contemporary debate on the efficient role of politicians and bureaucrats in the policy-making are visited referring to the recent papers of Alesina and Tabellini (2007, 2008).

# Bureaucracy and Gender

Hatice Altunok
Abant İzzet Baysal University, Bolu, Türkiye

## Synonyms

Bureaucracy and gender policies; Democratic administration; Equal representation in public space; Equality; Positive discrimination

## Definitions

Bureaucracy, in the context of gender, refers to the actor which can contribute to the formulation and implementation of policies that will ensure equal representation of women and men, *equally.*

## Introduction

The term "Bureaucracy" can be explained in various contexts. In this chapter, it is aimed to approach it in gender perspective. This perspective, naturally, has an interdisciplinary character; therefore, the analysis is limited by following subtopics: Historical Roots of the Gender of the Bureaucracy, Bureaucracy as a Mechanism to Ensure Gender Equality, Bureaucracy as a Policy Actor that can Contribute to Gender Equality.

## Historical Roots of the Gender of the Bureaucracy

It is a very common phenomenon that men and women have been pushed out of historical tradition for a number of reasons, such as the class, race, religious community they belong to throughout the history. The only exception to this is exclusion solely due to gender, to which only women who have been subjected and they have been discriminated because of their gender. Women were obstructed and limited to take part in education, work, to get paid for their work and to participate in social activities (Koray 2008: 343).When this case is examined in specific to the fact that women have been excluded from history writing and interpretation process, it is seen that the gender of the history date is male (Berktay 2015). It can be argued that the gender of the bureaucracy is also male based on the reference point suggesting that the gender of the history is male. In addition, the emergence of the state should also be considered as a decisive factor in the definition of the bureaucracy and gender relations since the bureaucracy is a state mechanism. Because when the historical background of the state is explored, references are made to a solidarity formation to establish and protect a community based on citizenship, tribal and familial bonds, and partnership between men. In these definitions, the authority of men to maintain the security of the society by making a power union, to determine the rules which are decided as necessary for this and to accept these rules, is striking. In this sense, the state is the construction of masculine imagination (Sancar 2014: 54). In this regard, Camilla Stivers in her article titled "Toward a Feminist Perspective in Public Administration" referring to Joan Landes and Wendy Brown points out that the limitation of women's participation in the public sphere has its source in the discourse that is seen universal and shapes this field. According to article, one of the reasons of the development and continuity of male-dominated political understanding is state construction of gender dimensions and origins (Stivers 2016: 713–714).

It is a fact that patriarchal family and society structure has been dominant in every society in parallel to the discrimination between men and women in every society for centuries. As there is no single type of society in which women have a real sense of dominance, it should be accepted that women, who are said to have dominance in the first place, have been generally defeated against men in the history. The gender discrimination between women and men leads to the division of roles in every society; this role division has left women alone with daily works by restricting them to house works and private life. On the other hand, a patriarchal society, in which men are interested

in politics and gain an effective status in society, has been established as a consequence of division of labor (Koray 2008: 343; Akal 1994: 52, 54). From this point of view, when the bureaucracy is analyzed in terms of gender, which is defined as the social and cultural construction of the sex difference, it is seen that the determinations in this area are in favor of the male. The male-dominated bureaucracy is the area where women try to make room for themselves.

In terms of gender roles, the focus has shifted from a mere women issue to comparison of men and women. Still, it is a fact that the search of gender roles in society is originated from the women's part because of gender discrimination and inequality (Maruani 2011: 795). However, because the bureaucracy is generally shaped on the ruling male and the ruled female, the hierarchy between the genders is clear. As the bureaucracy cannot hide it, the feminist point of view also explores this situation and endeavors to ensure gender equality. While traditional political theory naturally accepts gender relations, feminist theorists define them through patriarchal notions, as part of the political institutionalization of male power (Heywood 2016: 33).

## Bureaucracy as a Mechanism to Ensure Gender Equality

As of the end of the nineteenth century and the beginning of the twentieth century, women have been directed towards what was determined by men to be good for themselves. Occupational categories on which women concentrate on can be exemplified such as secretariat, nursing, and teaching. Besides these, they have been kept away from relatively more prestigious fields such as medicine and law. The compatibility of theory and practice should not be overlooked in gendered occupational activity. Max Weber, who theorizes the bureaucratic systems in which the decision-making stages are male-dominated, suggests that the initial professionals are clergymen, such as priests and prophets, who exemplify the construction of charismatic and traditional legitimacy forms. By the industrial revolution and the rationalization of the activities, the professions were designed for men until new occupational groups emerged (Picot 2015: 324–325). In this period, women who were active in the production process at home in the preindustrialization period entered work life outside the home. The introduction of a woman into working life has caused many problems related to the "case of working woman," and searching for solutions to these problems and questioning their rights have become a current issue. In the perspective of equality, the social changes have led to the demands of equality between men and women.

With the development of feminist thinking, women's right to education, right to elect and be elected, right to be appointed to public office, heritage and property rights have been included in constitutional and law, for example, the woman who waited for the eighteenth–nineteenth centuries to enjoy the right to education, waited for the twentieth century to be considered a citizen. In order to have equal vote as men, women in the USA and Western Europe had to fight for more than 100 years. In the twentieth century, women gained equal political rights in most of the member countries of the United Nations. In these acquisitions, the feminist movement had a significant impact on the treatment of the specific rights of women in the context of general human rights. In the late twentieth century, human capital, which required the redefinition of women and accompanying family life, was determined by the pursuit of economic independence and lifetime wage employment. Accordingly, a new gender equality balance can be mentioned. Although it differs by countries today, it is still a fact that women are much less able to participate in education, work, and politics than men (Berktay 1995: 758; Koray 2008: 343; Andersen 2011: 23).

While efforts are underway to improve the representation of women in each area, studies are still being carried out on the fact that even in developed countries, the historical contribution of women is not reflected and should be illuminated. For example, for American history, Stivers points out that both women and men take the lead in the progressive reform movement. There are the efforts of middle-class white women,

particularly the black women's organizations who are endeavoring to improve the administration in the south, women's support for legislation regulating working conditions and other achievements. Men in the same period are seen to be more effective and serious in the reforms and public administration processes, in which women were hardly ever involved. The period from the mid-nineteenth century to the end of the nineteenth century was the period when the roles of gender in the USA were sharply disrupted. When the process of the industrialization began, the gender-based discrimination of workers became an ideological distinction. The fact that more men work as paid workers outside while women deal with house works although they also had to work due to financial necessities is the basis of this ideology. Therefore, men increasingly began to be referred to as engaged, aggressive, and selfish, while women were defined to be more ethical, self-sacrificing, and loyal to their duties. This sexist formation is reflected in the appropriate political roles of women and men in the USA. While party politics is masculine, competitive, and open to all men of different classes, women's public roles are limited by voluntary charity activities (Stivers 1995: 523–525). There are widely used stereotypes of appropriate roles for each sex. Duties associated with demanding character or courage, creativity and other admirable qualities are defined for men. On the other hand, the natural role of the woman is defined as mother and the householder. Therefore, women's lower status in the American society is not entirely on public policies, but also results of these stereotypes (Cochran et al. 2012: 376).

As an example of another country, in Turkey, there is a clear male dominance in terms of bureaucracy and gender equality. In fact, some important steps such as women's right to political representation were taken earlier in Turkey than many developed countries. However, the representation of women particularly in senior bureaucratic decision-making levels is low. The number of female ministers who served throughout the history of the Republic is 21. In 2011, there was one female Deputy Minister that takes place as a political position in the Turkish administrative structure between 2011 and 2014. The figures are also in favor of men in terms of gender equality considering the number of undersecretaries and deputy undersecretaries who are the highest appointed administrators within the bureaucratic structure of the ministries. The first female undersecretary was appointed in the Ministry of National Education in 2010. Later, a female undersecretary took part in the Ministry of Family and Social Policy in 2014. During these appointments, it should be noted that the ministers of the relevant ministries were also women, so that it should not be overlooked that the position of women at the highest level of the bureaucracy was ensured by women ministers. At the level of Deputy Undersecretary, the first female was appointed in 1989. After that date, the representation of women in the deputy undersecretaries of several ministries was found. However, it is worth noting here that women are concentrated in certain areas of the bureaucracy (especially the Ministry of Family and Social Policy). For example, there are no female representatives in the upper levels of the bureaucracy such as the Ministry of National Defense, the Ministry of the Interior, the Ministry of Finance, the undersecretary or the deputy undersecretary (Altunok and Gedikkaya 2017). The current representation of women in the bureaucracy contradicts with gender equality considering that women gained the right to elect and to be elected in the early 1930s. In the story of gains obtained by paying big prices like democracy, justice, equality, men are told to struggle for victory while the same concepts are symbolized by female figures. "Republic" is a lean foot, a chest-open, attractive, and pure young girl, she rides a flag in her hands, and then she is recorded in the male-dominant history in which men resisted heroically not to give women the right to vote (Akal 1994: 76). Many problems that women and men now oppose and are struggling to deal with are related to gender which refers to preacceptances as defined by society and culture in the context of their male and female identities and roles (Michell 1985: 54). However, since unjust treatments such as the exercise of their rights, violence, and representation are mostly seen on the women's front, it is assumed that the gender issue is based on raising women's conditions to the existing male conditions. This is

generally a situation that is considered separately from people's economic or social problems. While efforts are being made to ensure gender equality, it is necessary not to confuse the goals of ensuring and developing male-female equality in context of ensuring the involvement of women in every field and balancing the statistics (Berktay 2014: 28). While demands increase in order to ensure gender equality in the bureaucracy, violence, mobbing, glass ceiling syndrome also increase. For this reason, ensuring the existence conditions of women is a priority criterion in order to ensure gender equality in the bureaucracy.

## Bureaucracy as a Policy Actor that Can Contribute to Gender Equality

The bureaucracy is an organizational model as well as among the official actors of the public policy process (Beresford 2000: 8–9). Therefore, bureaucracy must adopt gender equality as an actor of public policies and then take other steps once it has the necessary means. Bureaucracy is both an instrument to ensure gender equality and a barrier to it. In other words, as a key actor in both the formation and implementation of public policies, the bureaucracy can provide guidance on regulations and appointments that will contribute to ensuring gender equality. In terms of appointments in offices, especially in upper levels, gender equality can be prioritized. Models like representative bureaucracy can tackle the problems and barriers which can arise in implementation.

In this context, representative bureaucracy debates on ensuring gender equality in the bureaucracy bring a different perspective. Through this concept, all sections of society, not just women, are focused on bureaucracy representation and it has been suggested that these sections should assume bureaucratic positions. One of the scopes of the representative bureaucracy is the existence of women in organization and administration. Representative bureaucracy today is generally preferred as a short way of narration for the ultimate goal of equal employment opportunities and positive discrimination programs (Shafritz et al. 2017: 444–445; Farazmand 2010: 256).

The fact of male principles that are undoubtedly determinative in political field (Akal 1994: 83) is a case in the bureaucracy as well. However, there are also positive developments in the increasing number of well-educated women in the senior decision-making positions (UNIDO 2008). Despite the positive developments, this is far from being a real equality in domestic production and working life as feminists insist on (Andersen 2011: 220). This is not a problem that can be solved in the short run. In general, progress can be made in parallel with the development of the social and political mentality of women employment. This process manifests itself in the inclusion of woman-related goals in international organizations where it is not at the desired level. In the United Nations Post-2015 Agenda, the emphasis is on investigating the structural causes of violence against women, free care, limited supervision of their assets and ownership, and unequal participation in private and public decisions in order for women's rights to become universal reality. It is considered as one of the basic principles that women should be heard in decision making areas in public and private sectors.

## Conclusion

Bureaucracy is an actor with the capacity to produce and implement both a state mechanism and policies in which gender equality must be ensured. The bureaucracy as an organization model of the state has been shaped by patriarchy, which has been the dominant force since the birth of the state. However, with the development of the feminist point of view, the male dominant structure of the state has been criticized and women have begun to take place in the bureaucracy more than before. This involvement of women in the bureaucracy can be regarded as positive steps towards gender equality. Yet, democratization and equality in representation are not fully met in the bureaucracy. Today, it is emphasized that both developed and developing countries need to ensure gender equality especially in decision mechanisms. Likewise, the provision of gender equality in international texts is on agenda.

Gender equality is reachable if bureaucracy, as a policy actor, develops practices of equal representation and directs politics in this direction. In addition to all these, as Stivers emphasizes, public administrators should take into account the challenges by feminist theory. Thus, the historically determined predominant gender relations can be changed (Stivers 2016: 716).

## Synonyms

Cross-national developments; Globalization; Transnationalization

## Definitions

Administrative internationalization is broadly defined as impact of global, transnational, or regional processes on public bureaucracies within and beyond nation-states. It thus comprises effects upon, first, domestic administration systems (their structure, processes, and personnel) and, second, on the emergence of international public administrations as well as, third, on the interrelationship between national-, subnational-, and international-level bureaucracies.

Globalization is defined as the processes that integrate societies worldwide, affecting and changing procedures and structures of the political and administrative level, the economy, and the civil society (Hood 1995).

## Introduction

The analysis of forms and effects of what is usually conceived of as globalization or internationalization has become a major topic of political speeches and academic research, especially in the social sciences. While the consequences of globalization for Western economies and societies are often at the forefront of debates, their effects on public administrations are focused on relatively sparsely yet.

This entry aims at identifying the different manifestations and effects of internationalization in the context of bureaucracies. The subsequent sections provide an introduction and delineate the main mechanisms of internationalization. The next section identifies the topics discussed in the context of globalization, internationalization, and transnationalization and distils the main characteristics of international public administrations, as well as the effects and ramifications of internationalization on domestic public administration.

## Dimensions of Internationalization

Global migration streams; culturally heterogeneous public personnel; the emergence of networks encompassing national and international actors from the public and the private sphere, including an ever-increasing number of societal actors with multiple backgrounds; modified responsibilities of national administrations; and international legislation and regulation that extort the creation of new administrations at the international level, all these recent phenomena, to name only some, can be understood as manifestations of internationalization that affect bureaucracy.

"Globalization" in this context can be defined as "the process by which particular societies are coming to be incorporated into a single world society" (Hood 1995, 168). Hence, "internationalization" can be conceived of as a particular subset of globalization, inducing the same effects, but involving not necessarily the whole world, but stretching over specific (groups of) countries and impacting in some policy sectors more than in others. Consequently, even if the terms are not fully conterminous, in the following they are used interchangeably, as their effects tend to have a similar impact on the bureaucracy.

In this context it is of importance to note that (administrative) internationalization does not occur only as a consequence of interactions between states or public authorities from various levels alone but often involves private actors and complex societal networks that span the boundaries between different levels of governance, policy sectors, and, of course, societies (see Stone and Moloney 2019). Thus, also the concept of "transnationalization" is relevant – not least in order to remain empirically open in respect to what actually constitutes the potential causes of domestic administrative transformations. Administrative transnationalization should therefore be conceived of as a particular form of administrative internationalization that covers "activities, institutions, actors or processes that cross at least one national border, *especially* when actors other than national governments are involved" (Hale and Held 2011, 15; emphasis in original).

But what do these phenomena concretely imply for the bureaucracy? To analytically take this issue with the phenomenon of internationalization in public administration, one has to consider the different manifestations of the phenomenon of internationalization more systematically.

Overall, the academic debate about the internationalization of the bureaucracy started only at the end of the 1990s – late compared to the boom of literature in other disciplines in social sciences. Nonetheless, from the very beginning of globalization debates, scholarship has stressed the substantial impact of globalization on our societies as a whole and on the nation-state in particular (see, e.g., Farazmand 1999). As the discipline of

public administration is very heterogeneous, an open and discursive definition of what we understand to be internationalization is chosen, even if it is by no means exhaustive nor are the different phenomena mutually exclusive. Internationalization in the context of bureaucracy and public administration becomes manifest – at least – in three phenomena.

Internationalization may stand for the emergence and relevance of organizations and therewith bureaucratic structures beyond the nation-state, i.e., at the international and supranational level (Grande 2018).

1. Internationalization can be observed in the intensifying interactions between international or supranational politics and its respective administrations with national public administrations or between non-state groups or actors and national bureaucracies. Transnational policy networks, transnational public-private partnerships, and overall increased intensity of transgovernmental actions are indicators in this field.
2. Internationalization in the context of bureaucracy may finally appear in the form of domestic administrative adaptation in reaction to or with view to better influence international transformations.

This entry covers all dimensions of the delineated categories of internationalization of public administration. In this context, it is important to mention that there is no overall "theory of internationalization of bureaucracy," but for all manifestations of internationalization, different phenomena are put center stage in the scientific debate, often without a link to other aspects of internationalization.

In the following, after delineating the main perspectives on international bureaucracies, we highlight especially *domestic administrative change* whose origin can be traced to developments outside the national realm. These developments – that also include phenomena such as Europeanization or the impact of other regional integration schemes, for instance, NAFTA – challenge domestic administrative arrangements and are likely to result in transformations of established organizational structures, forms of bureaucratic interaction, and bureaucratic behavior.

B

## International Public Administration

The changes induced by globalization – visible as an intensified cooperation between national states as well as the creation of international regulation and laws – led to the emergence of new forms of international bureaucracies, as well as a quantitative increase of these bodies. Accordingly, international public administrations (IPAs) in the current quantity and quality can be seen as an offspring of globalization and likewise as a driver of globalization. Consequently, the study of international – and regional – bureaucracies has recently intensified (for others Bauer et al. 2017b).

IPAs are the secretariats of international (governmental) organizations and constitute the international counterparts to administrative bodies at national and subnational levels. They are established to assist governments and other stakeholders in institutionalized multilateral negotiations over global or international public policies and their application on the ground. Owing to their intimate involvement in the internal functioning of international organizations, IPAs do not only fulfill administrative tasks but are consequential for how modern global governance works. This has induced research that aims to find explanations for their structures and operating principles, issues of autonomy, the differences between international and domestic administrations, and questions related to the culture of these entities.

Overall, the phenomenon of international public administrations is studied in two broad approaches. While one strand of research is focused on a decisively disciplinary PA perspective, putting international organizations and their bureaucracies on the agenda of the discipline, developing a genuine PA perspective on the subject, or adhering to the PA research tradition when studying IPAs (for a summary, see Bauer et al.

2017a), the other strand is characterized by a multidisciplinary approach, including international relations, organizational sociology, public administration, public policy (international), political economy, and anthropology and focuses on the empirical subject of inquiry, the bureaucratic apparatuses of international organizations.

So, what do we know so far about the structures of and processes within IPAs, their role in the process of globalization, and the linkages to the political or administrative level in the domestic sphere? Overall, different dimensions of IPAs are focused on recent research. In addition to studies focusing on member states' influence on the IPA, there is a considerable research looking at IPA's influence both on the member state principals and policy outputs. While there is not enough space to report the variety of topics studied with regard to the policy role of IPAs (for a summary, see, e.g., Eckhard and Ege 2016), four characteristics of IPAs may be referred to, as it suffices to demonstrate their importance (Bauer et al. 2017c):

1. IPAs are more autonomous than national counterparts.
2. IPAs are more entrepreneurial, especially in view to generate their own budget.
3. For IPAs, expertise and information are more important tools than rules and formal powers because of the greater "fluidity" of actor constellations and mission change in the international sphere.
4. IPAs actively shape their organizational environment, especially by themselves co-determining the creation of new international organizations.

Furthermore, various active strategies by which influence can be exerted can be identified: IPAs can align with member states by persuading them of the benefits of certain policy options, act as gatekeepers and agenda-setters, or publicly name and shame their principals where they see implementation failure. While these features and types of behaviors are supported by evidence showing IPA influence in particular situations, the challenge for future research is to generate more systematic knowledge and establish under which conditions these characteristics actually affect international policy-making beyond individual instances.

## Transmission Channels of and Obstacles for Internationalization of Bureaucracies

Research on internationalization and bureaucracy is primarily focused on whether and why political, economic, and societal processes beyond the state induce administrative change. How does internationalization of domestic bureaucracies emerge, what are the effects for the national administrations, and how relevant are observable changes caused by it? An overall concept of "internationalization of domestic public administration" is missing, and so are overarching findings on how domestic bureaucracies act or react, but these questions are often linked to more specific debates – Europeanization, diffusion, devolution, and the new public management paradigm. From a theoretical viewpoint as well as with a view to empirical evidence, three mechanisms can be detected on how domestic bureaucracies are affected or react: (1) diffusion, (2) resistance, and (3) the transformation of bureaucratic power.

## Diffusion Effects

One important dimension is the question of what comes from outside the realm of the individual state (usually in top-down fashion) to bear on domestic administrative structures, processes, and behavior. In particular new public management (NPM) and how respective reform waves "hit home" are of relevance at this point. Also phenomena such as devolution and "agencification" (Dommett et al. 2016) can be observed. Another phenomenon in this context – in particular when it comes to less-developed countries – is the effect of international assistance and its implications on the national public sector of recipient countries.

The rapid diffusion of NPM reforms which is often described as a global revolution gained pace through active promotion by international

organizations, such as the World Bank or the OECD. These reforms began in countries modeled on the Westminster system, but by now some kind of NPM change has been implemented throughout the globe, particularly in Western democracies, albeit to different degrees and sometimes probably as mere legitimation-seeking "window dressing" (Christensen 2012). Nevertheless, the NPM reforms can be understood as a manifestation of internationalization, as they disseminated a particular set of public service values that often clashed with traditional domestic ones and therewith challenge the domestic administrations.

Nonetheless, the international sphere and the domestic sphere, even if de facto closely linked, stay analytically separated, and the linkage of what might be a focus of the internationalization agenda remains a black box. Accordingly, the effects of new regulatory tools, such as International Public Sector Accounting Standards, or performance measurement are often discussed as affecting national administrative arenas exclusively as "recipients" triggering national bureaucratic adaptation (Radaelli 2005, 925). While origins, drivers, and boundary-spanning domestic actors often remain outside the analytic scope and theoretical explanations, isomorphism is focused on. Mimetic, coercive, and normative forms of isomorphism are employed to explain the speed and scope of NPM intake of national bureaucracies (Christensen 2012). It is in the context of the analysis of national implementation of NPM reforms that the differential and often important impact of national administrative traditions and actor configurations are considered.

In sum, neoliberal ideas in the context of the global NPM reform agenda have influenced national administrations worldwide and induced changes that continue to shape administrative realities in many countries and even IPAs (Ege 2018). Obviously, there are mismatches between an aggressive global reform rhetoric and the modest convergence brought about by national modernization processes. Nonetheless, diffusion can be observed in many cases and seems to be a useful approach to explain how internationalization shapes domestic bureaucratic realities.

## National Bureaucratic Resistance

Despite considerable outside reform pressures, we can observe that national administrative change remains limited. Domestic bureaucratic robustness in the face of international pressures is thus the flip side of the diffusion debate described in the previous section. Governments, so the assumption, have to align their political agendas in a way that allows them to act more effectively in the globalized world while also preparing regional or local administrations for these adjustments. However, owing to their traditional, vertically hierarchical operating principles, such adaptation pressures are usually absorbed or disregarded. Even if the effects may differ between federations and more centrally organized states, "most government bureaucracies remain structured and staffed to manage traditional direct programs through traditionally structured and staffed bureaucracies. As the government's strategies and tactics have changed, its structures and process—especially its personnel systems—have not. [. . .] Thus, the first governance problem is adaptation: fitting traditional vertical systems to the new challenges of globalization and devolution, and integrating new horizontal systems to the traditional vertical ones" (Kettl 2000, 495). Also the role of specific national structures, e.g., local governance structures, is still of relevance in this context.

Another important aspect is the one of increasing costs due to decentralization. Devolution induces the formation of smaller, more cost-intensive administrative units. Consequently, fierce competition for financial resources may develop among entities or regions that have to finance these administrations, which would ultimately result in a national welfare loss. On the other hand, governments have been found to avoid reforms that might threaten the authority of the central state. This becomes obvious in cases where the "bureaucratic factor" leads to insufficient or deficient introduction of measures, a phenomenon that often can be traced to issues of "organizational turf," which are rooted, e.g., in conflicts between regional and federal administrations, or the resistance – or resilience – of local bureaucracies, but also the central government

itself. However, by and large, the empirical evidence for outside pressure becoming effective and relevant in explaining change of national administrative structures and behavior remains modest, to say the least.

Nonetheless, there may be an argument that domestic administrative change takes place, but it is not prominent in the literature, as the impact of global pressures on national administrations is hard to grasp empirically. Internationalization can be understood as a factor that affects an administration from several directions – therewith, national administrations are increasingly "porous" (Welch and Wong 1998, 43) and come under pressure through the indirect filter of national political, economic, and social systems as well as through direct international constraints to adapt to globalization.

In sum, much superficial diffusion and no real convergence can be observed – when international policy instruments are the focus. Public administrations are the decisive factor behind inadequate policy implementation results, and they are usually viewed as a constraining factor in the face of internationally driven convergence pressures. In other words, a main narrative concerns how national administrative structures and practices remain robust or resilient to pressures from the international sphere – a phenomenon that, by taking a bottom-up perspective, implicitly limits the analyses to the robustness of national administrative systems in the face of internationalization pressures.

## Power Shifts Toward and Within the Executive and the Transformation of Accountability

The result of the previously identified debate would be a pervasive "no change" expectation. Nonetheless, shifts in domestic power relations are triggered by administrative internationalization. These power shifts may occur between the bureaucracy and its political superiors or within the bureaucratic apparatus itself on the one side or concern a transformation of domestic accountability regimes on the other.

International forces may indeed transform the capabilities of national administrations to respond to domestic needs and requirements. They have "reduced the state's ability to contain the causes and accumulated consequences of its social, political, and economic evolution within its own boundaries" (Baltodano 1997, 624) and have transformed national administrations into a network that is closely linked to global systems and actors. There is fair evidence for a general adaptability of domestic administrations (Farazmand 1999, 514). However, it has to be considered that globalization – in particular corporate globalization and the increased impact of multinational enterprises – poses a serious threat to democracy and community. It potentially increases corruption and elite empowerment and eventually makes it more difficult for the state to strike the right balance between corporate elite interests and the broad public interest (Farazmand 1999). Another argument goes into a similar vein, the loss of national political control capabilities because of global interdependence, inter alia due to public-private cooperations or privatization that is "pursued purposely, deliberately, and vigorously around the world as a strategic instrument for promoting the globalization of corporate capital" (Farazmand 2002, 152). For instance, the erosion of governmental capacities for supervising bureaucratic activities is the feared consequence (Huddleston 2000). Hence, the doubt if globalization is really a manageable task for public administrations – or for politicians – to control outlines two scenarios for public administration in the age of globalization. In both cases, the significance of national public administrations diminishes. Either international organizations take over domestic administrative functions, as in the "global regime management" scenario, or "public administration will be constrained, challenged, and fragmented [. . .] with no courts or overarching authorities to settle disagreements" as in the case of the "neo-medieval administration" scenario (Huddleston 2000, 679). Overall, a crisis of "accountability, governance, and legitimacy" (Huddleston 2000, 671) is to be expected.

There is also fair evidence that globalization will change responsibilities and legitimacy

patterns. A growing number of administrative tasks will derive from international treaties and agreements and obligations to institutions at the international – or at least regional – level. The accountability to national political institutions, therefore, is likely to become weaker. Global forms of "standard setting" thus represent a significant deviation from the traditional relationships between legislative and executive bodies. New interests and stakeholders are involved in policy-making, and the nation-states' sovereignty and power are likely to decline as a result of their shrinking capability to keep complete control over their own administrations (Kettl 2000).

Additional insights related to the impact of internationalization on bureaucratic control and accountability come from studies about the emerging, loosely coupled administrative multi-level system within regional integration schemes, in particular the European Union (see, e.g., Trondal and Bauer 2017). European integration has created a shift for national institutions, in particular regarding internal domestic balance of powers toward governments and administrations, and has altered the power distributions within national executives. The developments within the EU are thus examples of how an "institutionally thick" form of internationalization affects national administrative systems, even if there is considerable heterogeneity among European states in their adaption processes. In this context, there is a loss of power for the national executives vis-à-vis EU agencies observable, but also a strengthening of ministerial departments, whose role is often enhanced. Studying the effect of Europeanization on relationships between ministries and agencies at the national level, also national agencies, is winning influence vis-à-vis their parent ministries. The identified effect is differential, however, in that participation in EU networks strengthens national agencies' policy development autonomy but not their autonomy in policy implementation. But the debate is ongoing. More recently, it has been claimed that central executives have (re)gained some control over its agencies. Especially after the 2008 global financial crisis and in the context of the debt crisis, governments in different countries in Europe "have gained stronger controls over the structures and practices of agencies" (Dommett et al. 2016, 535).

Different domestic reaction patterns are observable, differing among nations, but also sectors. Overall, national executives may adapt their structure and interdepartmental coordination in order to improve their access to the EU decisional arena as well as their domestic management of EU affairs, in particular "by empowering prime minister's offices, often at the expense of foreign ministries; by fostering administrative emulation and transfer through supranational learning; and by encouraging the alignment of domestic coordinating structures with the EU decision-making process" (James 2010, 832). Nonetheless, there are exceptions, as also other ministries may act as interlocutors between the EU and the domestic realm.

## Concluding Remarks

Internationalization is one of the persisting megatrends, challenging economic, political, and social systems as well as the bureaucracy. Both the emergence and increased role of international public administrations and the effects and reactions in the realm of domestic administrations are important manifestations of this phenomenon.

As for the first manifestation, IPA research as a field of enquiry has received a lot of attention in recent years and has grown out of infancy. Nonetheless, there may be some shortcomings related to the state-of-the-art research in this field, and to establish a concise research program, there are still steps to take. Inter alia, a sufficient understanding of the political role or influence of international bureaucracies presupposes the complementary application of different conceptual lenses that are hardly provided by merely sticking to a limited number of established approaches of PA. Furthermore, to consolidate the field and prevent conceptual patchwork, rigorous tests of existing findings seem to be necessary.

The second manifestation, "bureaucratic internationalization," is a particular type of domestic administrative change, whose origins can be

traced to particular developments outside the national realm that challenge domestic administrative systems and are likely to result in changes of established organizational structures, forms of bureaucratic interaction, and bureaucratic behavior. Three main phenomena can be identified when it comes to the national bureaucracy challenged by internationalization: non-convergence despite superficial diffusion, national administrative structures and cultures that induce or at least imply resistance against administrative change, and differential empowerment of core executives.

While diffusion approaches provide explanations for how external pressures translate into domestic administrative change, the resistance debate highlights the stickiness of national administrative processes, institutions, cultures, and behavior. In particular in the context of Europeanization, however, semiformal administrative interactions have emerged that transcend national borders and make particular parts of the national administrative systems increasingly autonomous, therewith spurring a process of reintegrating administrative action beyond the state in various sectors or levels. Also the emergence of fluid networks that stretch over borders and levels and issues of informality of exchanges within these networks seem to be of relevance. This includes, but is not limited to, public-private partnerships or knowledge networks and issues of learning (for others, see, e.g., Schomaker 2017). These new networks have different functions, in particular the exchange of information, harmonization of rules, and cooperation in the execution of these rules. Another aspect of practical relevance is the role of cultural norms in the process of internationalization. While cultural norms and their influence on the macro level – that is, public administration per se – are implicitly covered by some studies using more institutionalist approaches, very little attention has been paid to the microlevel and the change of individual bureaucrats' dispositions toward cosmopolitism. Beyond these research gaps, inter alia questions of implementation and measurement, and the application of more comparative and methodologically mature approaches may be taken into consideration to form a more comprehensive research program.

To sum up, so far we see the emergence of international bureaucracies, and tightening linkages between the domestic and the international sphere de facto closely linked, but they stay analytically separated; IPA-related research is kept apart from approaches that focus on domestic internationalization. This is more than a technical aspect only, as the dissolution of borders requires thinking differently about the domestic and the international. Hence, internationalization of PA as something that "hits home" and "emerges from home" at the same time should be conceptually and analytically combined in future research.

# Bureaucracy and Leadership

Richard F. Callahan
School of Management, University of San Francisco, San Francisco, CA, USA

## Synonyms

Leadership; Public Bureaucracy

## Introduction

In modern society, organizations are the dominant form of problem solving (Simon 1995). Organizations provide a structure and predictability for problem solving, which marks a fundamental shift from rules depending on a personal ruler to roles and rules that are impersonal (Webber 2017 [1922]). Within organizations, the role of leaders is a particular focus of research. At the core of this chapter are two premises: one, that organizations are central to addressing complex societal challenges; and two, that the complexity has significant implications for leading public bureaucracies. This chapter explores the interaction between leaders and bureaucracies in the following sections: one, ("Overview") an overview of organizations; two, ("Leadership") the varied levels of leadership in society; three, ("Four Frames of Public Organizations") the multiple frames for decision-making in organizations; and four, ("Complexities of Leading Public Bureaucracies") how public-sector leaders reconcile the implications of these complexities.

## Overview

The prevalence of organizations in contemporary society makes it difficult to realize the extent to which organizations problem solve in the private, public, and nonprofit sectors. In the past 100 years, the complexities of organizations draw on a range of academic disciplines to deepen the understanding the dynamics of organizations, including sociology, political science, and psychology. In professional fields, finding predictable patterns of behavior and consistent leverage points for effective action are centerpieces of business administration and public administration.

In the public-sector organizations are often referred to as bureaucracies. The study is strongly international (see for example Hood 1991). Extensive research has developed in a range of countries, including Western European Countries, Scandinavia nations, particularly Denmark; Asian democracies such as Japan, South Korea, and India, as well as extensive research on China; in North America, particularly in the United States; and in South American, particularly Brazil; and in Commonwealth nations, in-depth in the United Kingdom, Canada, New Zealand, and Australia.

In understanding bureaucracy and leadership, it is important to locate the unit of analysis. Herbert Simon's research into decision-making and organizations which was awarded the Nobel Prize, develops two distinctive insights into public bureaucracies: One, organizations are needed because of the limits of anyone individual to handle complex decision-making (1995). Two, there are five levels of society, best understood as each contained within the other, starting with individuals, then groups, then organizations, within the context of institutions and society (1952). Simon's insight suggests that leadership skills for organizations differ from leadership skills at the individual, group, institutional, or societal levels.

## Leadership

Recognizing organizations as only one of the levels of society suggests that leaders need a distinct set of skills to lead organizations as opposed to leading individuals, teams, communities, or institutions. The research on leadership in the public sector offers a wide range of theories and models of leadership (for the most comprehensive listing see Van Wart 2017). The initial distinction for leadership of public bureaucracies begins with the recognition of leadership in public organizations as fundamentally different than leadership in the private sector. The distinct nature of public sector leadership can be seen in the difference between models of strategy in the public sector developed by Moore (1995) that include a significant focus on the authorizing environment. The difference between strategically leading public versus private sector organizations is evidenced in Vining (2011) argument for the need for specific changes in the widely used in the private sector of Michael Porter's Five Forces Model to adapt to public sector demands.

Leadership skills needed in public bureaucracies vary across levels of government. In local government, the leadership skill set of a city or country manager emphasize direct supervision of department heads, working across a wide range of issues, a deep understanding of both the revenue and expenditure sides of the budget, political acumen to directly work with five or more elected officials, and community engagement. At the national level, the leadership skills needed to oversee employees spread over a wide geographical area differs for those skills needed in a specific policy area, such as health care. Also leadership position at different levels of government call for skills in expenditure controls or revenue projections, as well as in reporting to appointed officials, though occasionally needing a skill set to work for an elected executive and legislative oversight. Other units of government, such as special districts, which in the United States are the fastest and only growing number of units of government, can call for leadership skills that combine local government and national government (combining what? experience?).

As a result of varied expectations and structures of bureaucracies at different levels of government, no one template for leadership provides answers at each level of government. Some

reoccurring features across varied levels of government can include skills and abilities to:

- Effectively respond to elected official oversight.
- Generate new initiatives within the context of constitutional accountability.
- Develop and implement strategy.
- Meet the management requirements for audits and controls on public expenditures, while maximizing the effectiveness of budget resources.
- Anticipate future challenges while responding to current needs.
- Responsiveness to crisis either natural or man-made.
- Recognize fiscal constraints but to develop policy for minimizing the impact of future economic downturns.
- Offer new approaches to create new fiscal resources.
- Lead a diverse set of public employees.
- Civically engage.
- Master technical understanding across a wide range of specific functions.

Much of the research is specific to individual leaders of public agencies. The research offers a rich and varied set of individual examples of effective leadership at each level of government. Typically, the research considers exemplars of effective behaviors and skills of individual leaders, with details on the context, environment, and challenges. Also, comparative case studies have been developed in leadership to find shared characteristics across different agencies or policy arenas. Research also considers larger data sets, typically of surveys of existing leaders at a shared level of government. The overall findings suggest the dynamic nature of leadership calling for a mastery of context and specifics as well as interpersonal skills.

## Four Frames of Public Organizations

Effective leadership of bureaucracies starts with a recognition of the complexity of public organizations. The challenges that public organizations address range from education, to social services, infrastructure building, public safety, environmental protection, public health safety, national defense, and a wide range of additional responsibilities. The number and range of public sector organizations, across levels of government, defy generalizations that can be applied to all or many. Rather, the complexity of public agencies calls for multiple ways of understanding each organization. Varied models of organizational dynamics have been developed in research, with a helpful outline emerging from the research by Bolman and Deal, now published in a sixth edition (2017). Their findings start with the premise that no one perspective can fully explain the complexity of any organization. They argue for multiple frame analysis offering four frames to capture different drivers of behaviors in organizations. The frames are: Structural, Human Resources, Political, and Symbolic.

### Structure

The structural frame describes bureaucracies in terms of the reporting relationship, the job descriptions, the hierarchy, budgeting processes. The visual representation of analysis in this frame starts with the organizational chart. For leaders, analysis and decision-making in this frame develops structural alignment that support intended consequences, with a particular emphasis on oversight and accountability through clearly delineated chains of commands. In the public sector, this frame strongly aligns with an emphasis on civil service rules for hiring, promoting, and removing employees, coupled with the expectation of hierarchy and a top-down approach of providing orders and accountability as a dominant feature for problem-solving.

### Human Resources

The human resources frame places people at the center of the bureaucracy. This frame emphasizes addressing the needs of employees. In contrast to the structural frame, which views employees as readily replaceable in the organizational chart, the human resources frame views each employee as providing valuable contributions to the

organization's success. So, the central question for a leader becomes how to motivate and keep motivated the public-sector employees. Providing the support for workplace motivation becomes a pivotal task for the leader. Implicit in this frame is the belief that motivated employees more effectively problem solve, take the initiative, and create more effective organizations. For the public sector leader, the human resources frame calls for diverse teams of problems solvers, generating new and improved ideas from varied personal experiences and decision-making styles.

### Political

The political frame emphasizes the competition for scarce resources within a bureaucracy. The descriptive name does not refer to partisan, party politics, but rather the competition of competing factions within the organization. In public organizations, particularly these factions within a bureaucracy can reflect outside stakeholder groups, as well as internal groups. The resources include funding, personnel, as well as strategy and policy focus. In the public sector, this frame calls for leadership skills that include negotiation, consensus building, identification of competing factions, and the capacity to build and maintain consensus across varied various internal and external stakeholders.

### Symbolic

The symbolic frame recognizes the importance of symbols, as well as symbolic action. An important aspect of this frame is organizational culture, including behaviors that respond to unwritten expectations and values. The research on organizations over the past 30 years, increasingly finds that organizational culture drives organizational performance. For leaders of public bureaucracies, the implication of this frame is that analysis and actions need to account for the impact of symbols, as well as take steps to develop and support an effective organizational culture, driven by public sector values.

Supporting the multiple frame approach for understanding the complexity of public bureaucracies is the research on reform of U.S. federal agencies over a 50-year span by Paul Light (1997). Light finds four trends in reform of bureaucracies that strongly align with the four frames of Bolman and Deal (2017). Light argues that at different times, reform efforts predictable emphasize one of the following. He describes this predictability as a metaphor in the "tides of reform." As with the ocean tides, Light finds a regularly ebb tide of one reform, and the high tide of another type of reform. He describes the four tides as follows. One, scientific management, which similar to the Bolman and Deal structural frame, emphasizes organizational structure, through hierarchy and measurable results. Two, liberation management, which similar to the Bolman and Deal human resources frame, champions employees motivation as the key to improving overall organizational performance. Three, the watchful eye, which similar to the Bolman and Deal political frame, considers organizations as battlefields of negotiations and competing interest, calling for increases in political oversight of bureaucracies. Fourth, the war on waste, which similar to the Bolman and Deal symbolic frame.

For public bureaucracies, the concept of multiple frames analysis as the basis for more effective decision making coupled with the metaphor of the ebb and flow of tides of differing emphasis suggest the following four features to account for in leading public bureaucracy. One, the skills needed to lead a bureaucracy will include designing structures, connecting with employee motivation, negotiations, and building culture. Two, one-dimensional analysis or overly simple solutions will not address the multiple dynamics that affect organizational performance. Three, leadership of bureaucracy is context specific to the type of emphasis in the political environment. Four, bureaucracies are dynamic, subject to external forces, as well as internal pressures. These four features add up to make a strong case for what in leadership research is described as contingency theory (see for example, Van Wart 2017). In effect, the leadership skills needed, as well as the decision-making constraints and opportunities are largely contingent

on the circumstances and can vary considerably across different bureaucracies.

## Complexities of Leading Public Bureaucracies

The dynamics of organizations with multiple frames for actions and for reform occurring in real time, call for leaders of bureaucracies to reconcile the implications of these complexities. The focus on organizational level questions for leaders differs significantly from the questions for leaders to address, with significant implications for action with the type of question asked (Callahan 2001).

Within the contexts of bureaucracy, a range of research has developed to explain the best practices for effective public organizations. Key issues that have emerged in the last several decades in the study of public agencies include the very start of an organization in researching the design of public organizations (Moe 1990). However, as most public organizations are already in place, a significant amount of research has emerged on the reform of public organizations. This focus on reform has been developed at the national level looking how newly elected presidents have reorganized the executive branch (March and Olson 1983). Also, the emphasis on reform shifted from the national level to all levels of government with the concept of "reinventing government" (Osborne and Gaebler 1993). Reforming public bureaucracy is international, with the concept of "The New Public Management" characterizing a more entrepreneurial approach to the delivery of services through public bureaucracy. The challenge to this reform of public agencies was the tensions between streamlining existing processes while balancing the accountability in constitutional democracies.

In contemporary leadership of bureaucracies, several themes emerge that bring together the multiple frames into coherent action. The major trends in focus on leadership practices can be seen as across five research streams in public administration. These five are titled as follows: performance management (Moynihan 2008), creating public value (Moore 1995), strategy (Vining 2011), innovation (Borins 2014), and cross-sectoral (Crosby and Bryson 2005). The implications for each trend for leadership of public bureaucracies are described below.

B

## Performance Management

Developing from the New Public Management movement has been an emphasis on performance management. The emphasis on the role of the leader is to increase bureaucratic effectiveness through developing performance management systems (Moynihan 2008). Leaders rely on performance management systems to establish measures for performance of varied parts of the organizations, with a greater emphasis on outcomes as opposed to outputs. The expectation is that the leader develops structures and organizational culture that support performance measures. Effective performance management systems are expected to extend beyond the term of any particular leader, but to increase performance through increased accountability on an on-going basis.

## Creating Public Value

The concept of creating public value was developed to parallel the concept of creating profit in the private sector (Moore 1995). This framework looks at the leader's role as connecting the operating capacity of the bureaucracy, with the authorizing political environment to create new programs or better leverage existing resources to create services that are valuable to constituents and stakeholder groups. The leader is creating public value typically has strong negotiation skills to work with elected and appointed officials responsible for oversight of the public organization. Significantly, the leader's role is not necessarily to accept the status quo, but to develop a more entrepreneurial approach to leading the bureaucracy.

## Strategy

Increasingly, research shows the importance of strategy in leading public-sector organizations (Vining 2011). Fundamentally, strategy aligns the activity inside an organization with forces outside the organization. Strategy applies a bureaucracy's resources – budgets, people, expertise – with the expected impact or outcomes from the outside. Strategy in the public sector has an increased complexity in comparison to the private sector (Vining 2011) with the need to account for the inherently political environment of any public bureaucracy. Public sector executives lead both vertically within the organization, as well as with reporting to external oversight both appointed and elected.

## Innovation

Innovation in public bureaucracies can be characterized by persistence in leadership (Borins 2014). The process of innovation varies with a tension between leaders competing or collaborating as drivers for innovation, with the potential for leaders to facilitate bottom-up innovation or start with a top-down approach (Sorensen 2012). Innovative processes allow leaders the flexibility to respond to emerging needs, as well as changes in technology, funding, or state-of-the-art knowledge. In many ways, the process of innovation and implementation of innovation calls for mastery of the human resource and symbolic frames identified by Bolman and Deal (2017) to free up the potential of employees and to implement a culture of innovation.

## Cross-Sectoral Leadership

A significant shift in the leadership of public bureaucracies has occurred in the past 30 years. The emergence of the distinction between a public agency being responsible for a service and the actual providing of a service allowed for contracting out of public services. The increase in nonprofit service provision of social and health services calls for a leadership skill set in managing across the public and nonprofit sector (Crosby and Bryson 2005). For cross-sectoral leadership, the skill sets includes building and overseeing effective service delivery networks, working with community-based organizations, developing processes, such as Task Forces or community meetings to effectively identify community needs, as well as risk identification, risk management, and risk mitigation for contract management. This type of leadership can be described as horizontal with shared power, across public and nonprofit agencies, as opposed to the vertical leadership up and down a bureaucracy with the power of command and control found in organizational hierarchies.

## Conclusion

The complexities of addressing contemporary societal challenges through problem-solving call for the development of leadership skills over the course of a lifetime (Callahan 2017). Leadership of bureaucracies calls for mastery of the internal dynamics of structure, human resources, political negotiations, and organizational culture. Moreover, externally, to develop a strategy that aligns the internal missions with the external outcomes, the ability to design systems to measure results, to innovate, and the skill set calls for the capacity to build networks. A framework for leadership of public bureaucracies starts with the recognition that the complexities of the challenges faced by leaders call for dynamic solutions with analysis and action informed by multiple perspectives.

Administrative procedure; Complex systems; Governance; Information technology

## Definitions

Bureaucracy is an excessively complex administration procedure or a system of governance in which most decisions are taken by stated officials instead of elected representatives. Media represent mechanisms of mass communication (broadcasting, publishing, and the Internet).

## Introduction

Over the past decades, the liberalization of information and communication technology (ICT), especially in many developing countries, has led to a multitude of positive development externalities. One such consequence is the improvement in governance and decrease of bureaucracy (Asongu et al. 2018b). This is essentially because new media technologies decrease intermediary rents between citizens and government agencies, since they enable direct participation of citizens in the public decision-making processes. In a nutshell, information sharing by means of new media and

technologies reduces informational rents previously enjoyed by a few elite who monopolized such information (Tchamyou and Asongu 2017; Asongu et al. 2018a).

Building on the above insights, a study by Asongu et al. (2018b) investigates the relationship between mobile phone penetration (respectively, proxy for a new media and technology) and good governance (respectively, proxy for decreased bureaucracy) in sub-Saharan Africa (SSA). The study is motivated by two main factors in academic and policy circles. First, recent literature is consistent on the position that while mobile phone penetration has reached saturation levels in developed countries and more technically advanced developing countries, there is a still a great potential for penetration in Africa (Tchamyou 2017; Afutu-Kotey et al. 2017; Asongu and Boateng 2018). By extension, such potential can be leveraged by policy makers to address policy syndromes such as exclusive development and poor governance.

Second, about half the countries in SSA did not achieve the millennium development goal (MDG) extreme poverty target, in spite of the fact that the subregion has enjoyed more than two decades of resurgence in economic prosperity (Asongu and Kodila-Tedika 2017; Tchamyou 2018). Good governance, which can be promoted with new media technologies, has been documented to improve a multitude of development outcomes, inter alia: living standards, inclusive development and efficient distribution of resources.

## Mobile Phones and Governance

A study by Asongu et al. (2018b) presents theoretical and empirical perspectives on the relevance of mobile phone penetration in boosting good governance in 47 SSA countries for the period 2000–2012. Three governance categories are considered in the study, namely: political governance (consisting of political stability/no violence and voice & accountability), economic governance (entailing government effectiveness and regulation quality), and institutional governance (encompassing corruption-control and the rule of law). As a robustness check, the governance measures are bundled by principal component analysis in order to provide room for more policy options (Asongu and Nwachukwu 2017).

The study is original and valuable in the perspective that, it offers both theoretical and empirical insights into the relevant media technologies (i.e., mobile phone penetration) in promoting governance and by extension decreasing bureaucracy which is a characteristic of poor governance. Moreover, the positioning of the study complements the scant literature on the importance of media and technologies in governance and bureaucracy in Africa (Snow 2009; Matthias 2012; Porter et al. 2016; Gagliardone 2016).

It is important to note that Snow (2009) has established a negative nexus between the mobile phone penetration and corruption levels. As for Matthias (2012), there is a positive relationship between openness and accountability in Africa. A focus on South Africa, Malawi, and Ghana by Porter et al. (2016) provides insights which lead to the conclusion that the use of mobile phones by youth, if effectively leveraged by policy makers, could increase the harmonization between practice and policy implementation. The relevance of linkages between government quality and mobile-radio interactions is examined by Gagliardone (2016) who concludes that preventive and corrective initiatives considerably enhance the investigated linkages.

It is important to note that the study by Asongu et al. (2018b) improves the discussed literature on four main ways. First, contrary to Snow (2009) and Porter et al. (2016) who have focused on country-specific cases, using panel data that entails many countries provides policy implications that are relevant to a broader set of countries. Second, instead of focusing on one dimension of governance, as is the case of Snow (2009), taking many governance indicators is relevant both in terms of robustness of the empirics and policy implications. Moreover, the study by Porter et al. (2016) does not directly

focus on good governance. Third, the radio channel used by Gagliardone (2016) is a somewhat outdated media; hence the need to consider a more updated media such as mobile phones. Fourth, the analysis of Snow (2009) is statistically fragile because the conclusion of the study is based on considers correlations rather than causality.

## Conclusion

The study by Asongu et al. (2018b) has provided empirical and theoretical arguments on the relevance of mobile technologies in boosting good governance in 47 countries in sub-Saharan Africa for the period 2000–2012. Generalized method of moments (GMM) are used as the empirical strategy and six governance indicators are bundled by means of principal component analysis (PCA) in order to derive three main composite indicators, namely: political governance (consisting of political stability/no violence and voice & accountability); economic governance (entailing government effectiveness and regulation quality) and institutional governance (encompassing corruption-control and the rule of law).

The following main findings are established in the study. *First*, with regard to unbundled measures of governance, it is found that mobile phones consistently improve governance dynamics. *Second*, within the robust framework of bundled governance indicators, the same conclusions hold with the exceptions of: (i) political governance for which the effect is not significant and (ii) the economic governance specification which fails to pass postestimation diagnostic tests. The effect of general governance is about thrice as high as the impact of institutional governance.

The findings converge with Snow (2009) in the perspective that informational rents which are captured by a few selected elites and contribute to poor governance can be reduced through an information sharing mechanism such as the mobile phone. This is consistent with the bulk of theoretical literature on the importance of mobile phones in improving governance. However, the findings are not broadly consistent with the strand of literature supporting the role of information technology in poor governance characteristics like violent collective action.

Department of Public Administration and Urban Studies, The University of Akron, Akron, OH, USA

## Synonyms

Contracting; Government-by-proxy; Privatization

## Definition

Bureaucracy refers to a formalized, hierarchical, and specialized organizational setting designed to manage large-scale administrative functions and tasks by emphasizing rules, control, hierarchical authority, and coordination.

## Introduction

Bureaucracy refers to "the type of organization designed to accomplish large-scale administrative tasks by systematically coordinating the work of many individuals" in an efficient way (Blau 1956, p. 127). The term *bureaucracy* implies (1) a distinct organizational setting, which is formalized, hierarchical, and specialized with both a clear functional division of labor and demarcation of jurisdiction, which is standardized, rule based, and impersonal; (2) a professional, full-time administrative staff with lifelong employment, organized careers, salaries, and pensions, appointed to office and rewarded on the basis of formal education, merit, and tenure; and (3) a larger organizational and normative structure where government is founded on authority, that is, the belief in a legitimate, rational-legal political order and the right of the state to define and enforce the legal order (Olsen 2006, pp. 2–3).

In relation to the politics-administration dichotomy, bureaucratic government has been considered an instrument for "good" government, regardless of political constraints, because bureaucracy meant efficiency and efficiency meant good government. In the process of transforming the United States from a regionalized agrarian society into an industrial and national society, bureaucracy has become an instrument of governance for addressing social problems in an efficient manner, on the assumption that it would contribute to "unity and coordination, precision and speed, predictability, obedience and loyalty, impartiality, reduction of friction and of material and personal costs, knowledge of files and an institutionalized memory, and continuity across changes in government" (Olsen 2006, p. 8).

However, its emphasis on rules, control, hierarchical authority, and impersonality has ironically been criticized as inefficient and undemocratic because of bureaucratic pathologies such as trained incapacity, replacement of ends with means, and over-conformity. Goodsell (2004) notes three key points made by critics of bureaucracy: poor performance, excessive power, and oppression of the individual. Since a brief encyclopedia article cannot capture the vast array of themes and studies of bureaucracy, this entry limits itself to the debates on bureaucracy in relation to the theme of performance. Thus, among Goodsell's (2004) three charges, the discussion that follows focuses on the first criticism by (1) reviewing the ongoing debates on bureaucracy in relation to its performance; (2) presenting contracting out, also called outsourcing, as a form of privatization; and (3) discussing privatization's pitfalls and ironies and what needs to happen for such strategies to work well.

## Debate on Bureaucracy and Performance

The first criticism that Goodsell outlines focuses on unacceptable performance, including arguments of general distrust of public ownership and government monopolies, fear of unlimited budget expansion, and obsessive conformity to rules, which creates goal displacement (Goodsell 2004). It has become a popular notion that bureaucracy – particularly governmental bureaucracy – is invariably huge and inefficient, as people

witness growing government budgets and tax assessments year after year. Although some argue that such common negative perceptions of bureaucracy are highly overblown, they do raise the serious question of why bureaucracy is so widely assumed to perform poorly when compared to other forms of organizations found in the private sector.

The most noted economic approach to bureaucracy, public choice theory, is concerned with inefficient allocation of resources because of the budget-maximizing attributes of government bureaucracy. To Ostrom (1989), a public choice theorist, bureaucratic organizations are inherently subject to conditions of institutional failure. Public agencies have difficulties in allowing the expressing of diverse preferences among different communities of people since they provide public goods without information about customers' preferences. Therefore, expenditures will be made with little reference to consumer utility, and producer efficiency in the absence of consumer utility is without economic meaning. In this sense, Ostrom conclude that bureaucracy will "(1) become increasingly undiscriminating in its response to diverse demands, (2) impose increasingly high costs on those who are presumed to be beneficiaries, (3) fail to proportion supply to demand, (4) allow public goods to erode by failing to prevent one use from impacting others, (5) become increasingly error prone and uncontrollable to the point where actions deviate from public purposes and objectives, and (6) compound these problems to the point that remedial actions actually exacerbate rather than ameliorate problems" (Ostrom 1989, p. 56).

Such a notion of inefficient bureaucracy is closely associated with the size and growth of governmental bureaucracies. Like all organizations, bureaucratic governments also inherently tend to expand in size (Downs 1967). As the bureaucracy expands, wasted motion or unproductive efforts can become dominant and authority is diffused; to counteract this decline in control, the administrative bureaucracy becomes "a gigantic machine that slowly and inflexibly grinds along in the direction in which it was initially aimed" (Downs 1967, p. 160). Likewise, Niskanen (1971) argues in his budget maximization bureaucrat model that public administrators tend to focus on their organization's budget maximization, operating out of self-interest instead of the public interest. In this view, bureaucratic expansiveness led by extensive regulation and government growth inherently results in bigger budgets, larger staffs, and higher salaries (Niskanen 1971).

Against the critics of bureaucracy, the pro-bureaucracy literature disagrees with the notions of an "inefficient" and "underperforming" bureaucracy, asserting that government performance is not as bad as the public may perceive it to be. Milward and Rainey (1983), for example, present eight reasons why governmental bureaucracy is more valuable than is widely understood. First, the notion of the inefficiency of governmental bureaucracy is ill-conceived because efficiency in the private sector cannot be compared with efficiency in government. Second, government pursues values that are more complex than efficiency; governments should achieve efficiency along with other values such as equity, responsiveness, and accountability, which can be inconsistent with one another and with efficiency. Third, government is required to adopt higher performance standards because the public is regarded as the owner of the government. Fourth, external groups such as Congress and interest groups make different and sometimes contradictory requests that limit the autonomy of government. Fifth, policymakers craft vague laws or regulations, forcing bureaucracies to accept responsibility for and take risks in the face of ambiguous guidance. Sixth, government, with its inherently limited capacity, faces a virtually endless array of often conflicting requests. Seventh, politicians focus on macroeconomic matters such as inflation and unemployment rates more than on the performance of specific programs, which can limit the effectiveness of those programs. Lastly, the public as a whole has a negative stereotype of bureaucracy, even though individuals regularly have favorable experiences with public agencies. Similarly, Goodsell (2004, p. 48) argues that the notion of "business-is-better" is a myth about governmental bureaucracy in which (1) the

public-private distinction is not clearly distinguished, that business also takes the form of organized bureaucracy, that the assumption of perfect competition in private markets is also mythical in the real business world, and that comparisons between the public and private amount to "apples and oranges."

## Privatization and Outsourcing: Transforming Bureaucracies into Market-Oriented Organizations

Over the last few decades, a vast array of administrative reform efforts have been undertaken under the general slogan of "running government more like a business," with the goal of improving the performance of public organizations, moving from bureaucratic ideas of hierarchical authority, responsibility, efficiency, a system of rules and control, and impersonality to post-bureaucratic ideas of customers, service, quality, value, flexibility, innovation, empowerment, and continuous improvement (Barzelay 1992, p. xiii). President Reagan cited bureaucracy as an axis of government failure, and some have used the very word "bureaucracy" as a "pejorative slogan" (Olsen 2006). Administrative reform movements include, but are not limited to, Total Quality Management programs, the Reinventing Government Movement, the National Performance Review, and the President's Management Agenda. Throughout these recent developments, the privatization of public services has been widely used as a managerial strategy aimed at achieving efficiency and flexibility in government programs at all levels in the United States.

Privatization is defined as "the act of reducing the role of government, or increasing the role of the private sector, in an activity or in the ownership of assets" (Savas 1987, p. 3). Under the privatization movement, many nongovernmental entities, including private and nonprofit organizations, have become involved in areas that were once the exclusive purview of government. Some scholars have called this phenomenon "third-party government" or "government by proxy." Third-party government refers to the system, in which "government establishes priorities and generates funds but leaves the actual delivery of services and the operation of public programs to a variety of nonfederal third parties"(Salamon 1989, p. 9), and "proxy" describes these third parties such as states, cities, counties, banks, industrial corporations, hospitals, and nonprofit organizations (Kettl 1988). Privatization takes various forms. For instance, Savas (1987) suggests a hierarchical order of many forms of privatization, arranged from high government involvement (e.g., contracting, grant, voucher, and franchise) to low government involvement (e.g., volunteers and self-service). Among these various forms, contracting with nongovernmental organizations (profit or nonprofit) is the most typical form of privatization so that the notions of privatization and contracting are often discussed together or even interchangeably.

What forces have driven privatization all over the world? Savas (1987) lays out four forces of privatization: pragmatic, ideological, commercial, and populist. First, when experiencing fiscal stress, governments have turned to privatization as a way to stretch smaller budgets and improve the cost effectiveness of government services. Second, privatization has been promoted due to ideological concerns that the size and power of government has expanded to the point of harming democracy. Since privatization involves "changing from an arrangement with high government involvement to one with less" (Savas 1987, p. 88), it also means a "depoliticization" of the bureaucracy that leads to opportunities for participation by third parties and the public. Third, commercial advocates argue that more government spending, which forms a large part of the economy, should be directed toward private firms. Fourth, based on public choice theory, populists believe that privatization is one way to offer the public more choices in public services. Those forces have heavily influenced privatization initiatives in recent decades.

In the United States, the privatization movement was spurred by Osborne and Gaebler's nationwide bestseller book, *Reinventing Government*, which highlighted competition as a mechanism to improve efficiency and effectiveness of

public service delivery. Such movement has forced agencies to reduce inefficiencies, to seek budget-performance integration, and to compete with other agencies or nongovernmental entities. It has led agencies to change their work environments to become more competitive and business like. Thus, the privatization movement has caused public agencies to transform their bureaucratic approach into a market-oriented perspective by bringing market-oriented mechanisms that emphasize increased efficiency, reduced costs, and improved quality of services.

Why does privatization make government programs efficient and flexible? According to neoclassical economic theory, in a free market, voluntary exchanges between someone who wants to buy and someone who wants to sell determine the level of supply and production, which results in both efficiency in resource allocation and an increase in individual welfare. This efficiency of resource allocation is further reinforced by competition between producers, which results in minimizing costs, limiting price increases, and increasing the consumer's choice. Finally, the competitive market drives inefficient producers out of business, which regulates the quality of products. Therefore, advocates of privatization believe that the private sector would be a more efficient producer than the public sector, which lacks competition and the profit incentive.

Based on the assumption of market theory that human beings are rational and tend to maximize self-interest, public choice theorists explain how government makes choices in resource allocation. Government choices are inferior to those made by markets in terms of resource allocation efficiency because supply and demand rarely balance in government programs and because government's monopoly position structurally excludes competition, meaning that the government cannot minimize costs and increase choice for consumers. Since bureaucrats have no incentive to seek efficiency in the operation of government programs – indeed, they have an incentive to maximize their agencies' budgets and their own job security – they are likely to produce inefficient results. Based on this logic, public choice theorists suggest privatization as a cure for the inefficiency of government programs, a way to break the monopolistic power of public agencies, and a means of forcing government to offer citizens more choices in services traditionally provided by the government.

## Privatization Pitfalls: Theoretical Problems

The theoretical issues concerning privatization problems can be classified into four categories: market imperfection, the agent problem and transaction costs, "governmentalization," and the problems of accountability and governance.

First, arguing efficiency through privatization should be based on several conditions that make the market competitive: Kettl called it "arm's length transactions among large numbers of buyers and sellers for relatively undifferentiated goods" (1993, p. 15). However, it is very difficult to meet these conditions in actual privatization efforts. Because public goods tend to be less profitable and more complicated to deliver, most public contracting involves either no competition (monopoly) or only minimal competition among very few firms (oligopoly) (Sclar 2000). Therefore, competition is rarely found in markets for public goods because of the fundamental structure of such markets.

Second, in the principal-agent relationship, the government (a principal) should write a contract that induces the contractor (an agent) to behave as the government desires. However, this principal-agent relationship has inherent weaknesses. First, agents always have their own interests that might conflict with the principal's interests, so the temptation for agents to shirk their duties is always present in principal-agent relationships. Second, principals' efforts to monitor agents' undesirable behavior is often futile, because agents always know more about their own behavior than principals do or ever could. Furthermore, the contractor, as an agent, is more liable to opportunism than government. With respect to this additional cost caused by information asymmetry and the consequent uncertainty between the government and the contractor, transaction costs theory provides

useful insights; when the government chooses contracting as opposed to direct administration, there are additional information costs necessary to ensure a successful transaction, such as searching, monitoring, enforcing, and policing costs (Williamson 1981).

Against the privatization proponents' argument of *less* government, some scholars insist that privatization through contracting has ironically resulted in increases in government roles (Rainey 2014). Through regulations, obligations, and restrictions accompanying contracts, privatization has produced unprecedented involvement of government in the affairs of the private sector. This "governmentalization" tends to make private contractors "just one more interest group" that lobbies the government to protect and expand its own financial bases and other interests (Rainey 2014).

Since contracting puts extra links in the hierarchical chain of overhead democracy, contracting relationships tend to attenuate the connection between citizens and public officials in government programs, which weakens the lines of political accountability (Moe 1987). Moreover, privatization involves "the sharing of powers," which means private institutions exercise considerable discretion over the spending of public money and the use of public authority. A system of shared powers inevitably allows private suppliers a substantial degree of autonomy from government control. The public managers administering contracting, then, are ultimately answerable and responsible for programs over which they have little actual control and authority (Salamon 1989).

## Barriers to Success: Managerial Problems of Contract Management

Debates over privatization, or the contract state, have tended to obscure longstanding issues of concern regarding public sector management. The political and economic context of privatization has been linked to the issue of declining resources and increasing pressures for efficiency, the legitimacy of bureaucratic administration, and the idea that privatization provides a way for cuts in service costs and spreads governmental responsibilities more widely. The expansion of privatization has raised questions about the changing nature of public management and imposed challenges on public managers. As Brown et al. (2006, p. 323) suggest, it is clear that there are several striking elements in public service contracting:

- Contracting is and will continue to be a major task facing public managers.
- Public managers do not always have a choice about contracting and may be required by elected officials to do so under less-than-optimal market conditions.
- Public managers charged with contracting operate in politically charged environments that put a premium on balancing competing stakeholder values.
- One-size-fits-all judgments about contracting are generally unrealistic: Contracting can improve service delivery or it can be a disaster, depending on the underlying market conditions and management efficacy.

In the evolution of the contract state, the effective management of public service contracts and privatization is necessary for excellence in public management. However, the fundamental irony of privatization arises from the fact that "the government's reliance upon the private sector has grown faster than its ability to manage it" (Kettl 1993, p. 20). Attempts to manage public service contracts successfully face a variety of obstacles, and the success of privatization, from the perspective of society and its citizens, depends largely on the administrative capacity of public managers responsible for privatization. In terms of the work flow regarding privatization, especially contracting, the managerial skills requiring excellent capacity are as follows: setting clear goals and performance criteria, choosing contractors, and monitoring and auditing performance.

### Setting Clear Goals and Performance Criteria

The goals and values of the contracting program should be clarified to make contractors know

what they are expected to do. Without a clear job description, no contractor can be expected to meet the government's expectations, and the government cannot monitor and evaluate the performance of the contractor. However, there are several problems in setting goals and performance criteria in privatization. First, in principle, the goals of government programs are determined by the legislature through laws (Kettl 1993). The policy intent described in many laws, however, is commonly vague and often encompasses multiple and even contradictory values. Moreover, many goals associated with the public interest, such as accountability, responsiveness, and fairness, are inherently hard to measure, due to their fundamentally intangible nature. Therefore, interpreting the true policy intent of the legislature and exercising appropriate discretion to serve the public interest are enormous challenges for public managers. Second, it is hard to match the goals of private partners with the government's precise objectives. Because of the self-interested nature of contractors, conflicts of interest create an inherent tension between the government and the contractor. To cope with these conflicts, it is necessary for the government to develop appropriate incentive systems in order to induce the contractor to perform as desired. Finally, there is a problem of over-specification and overregulation (Kettl 1993). While clarification and specification are very important in contracts, they may also be so voluminous as to be overwhelming and excessively detailed. This overspecification and overregulation may stifle the contractor's innovative impulse, which was the initial purpose of privatization. Obviously, a tradeoff is necessary between sufficient specificity to protect the public interest and enough flexibility to permit innovation and efficiency in contracts. Balancing these two demands is the role of public managers who are responsible for privatized programs.

### Choosing Contractors

In the principal-agent relationship, the government's selection of contractors cannot be perfect because of adverse selection and information asymmetry. Contractors always have more information about themselves than the government, so that they have both the ability and the incentive to conceal or downplay any critical problems or conditions. This makes it effectively impossible for the government to hire the best possible contractor. When the market for a privatized activity is dominated by a handful of vendors, the government often cannot make a good deal, because it is difficult for public managers to choose the best contractor among only a few qualified and experienced bidders. If the government's choice is limited by such environmental imperfection, the self-discipline of the market cannot work as it should in theory. Unless genuine competitive bidding can be employed, privatization leads to the waste of a new set of opportunities and incentives. Furthermore, a lack of competition in choosing the contractor can provide an opportunity for corruption and scandal. The awarding of contracts generally involves substantial sums of public money and considerable discretion among public officials, which often results from the lack of competition and thus may carry risks of bribery, collusion, and extortion (Moe 1987). In addition, political pressures in choosing a certain bidder may hinder fair competition in contracting, which results in the loss of the advantages of privatization (Rainey 2014).

Moreover, it is not always obvious that soliciting repetitive and competitive bids from many vendors is superior to a single long-term contract with a reliable vendor because it is not clear that regularly seeking a low price is superior to reducing uncertainty (Rainey 2014). As with private firms that prefer long-term relationships between buyers and sellers, the government often seeks reliability in supply and quality rather than merely low price in its privatization efforts. However, a long-term relationship often increases the government's dependency on the contractor and makes the government vulnerable in terms of maintaining accountability to provide the privatized activities. To relieve the risk caused by this situation, it is necessary for the government to prepare to deploy in-house expertise to take over the activity, although this can be an enormously expensive exercise.

### Monitoring Performance of Contractors

Monitoring is crucial to ensuring accountability in privatized activities. The monitoring system enables public managers to evaluate a contractor's performance in terms of the publicly determined goals of the program. To oversee privatized activities properly, the government must have sufficient staff with the appropriate expertise, but this requirement can be very difficult to meet. In addition to the lack of monitoring staff with expertise, there are other problems in acquiring appropriate information regarding a contractor's performance. First of all, excessive monitoring places additional burdens on the contractor and sometimes generates unnecessary bureaucratic red tape, thereby impeding the achievement of efficiency and flexibility, which are the main goals of privatization. In addition, the information asymmetry between the principal and agent may cause inefficiency in contract management since the government needs additional safeguards to avoid a distortion of information flow. The government's reaction to such problems, however, often causes another problem: recentralization (Kettl 1988). When severe problems develop in privatized activities, the government tends to centralize the privatized functions through more auditing and more rules. Inevitably, such strict auditing tends to make the privatized activities less flexible and innovative and thus fails to achieve the initial goals of privatization.

Along with such managerial concerns, Brown et al. (2006, pp. 328–329) suggest that there are three stages of the contracting process required for the successful management of privatization as follows:

1. Values, including public interest values, are the stakeholder preferences that public managers must balance or optimize as they deliver services. Throughout the phases of contracting, public managers should continually identify and prioritize the often politically contentious public-value preferences of key stakeholders. To the degree that managers have discretion, these values or value trade-offs should guide the use of different contract management tools, as well as inform the research strategies of scholars.
2. Institutions, or the laws and organizational arrangements that frame service delivery, determine the range of tools and resources that public managers can employ to achieve stakeholder values. Public managers need to identify (and researchers need to consider) the legal architecture that governs contracting. Legal mandates define the boundaries within which public managers can operate to optimize and balance targeted values, whereas contract management and monitoring incapacity increase the risk of failed contracts.
3. The characteristics of services and their markets influence which contracting tolls are best suited to achieve stakeholder values. Public managers should determine whether service and market conditions favor contracting. Of particular importance are factors that increase the risk of contract failure – thin markets and asset-specific and difficult-to-measure services. When these factors are present, public managers should internalize service delivery (if they can) or expand contract management capacity.

## Conclusion

This entry has set out to broaden and deepen the reader's understanding of the concept of bureaucracy by pulling together the various stands of the literature on notions of efficiency and effectiveness that are underpinned by strong theoretical foundations. In the context of a nationwide movement to improve government performance, bureaucratic systems and ideas have been transformed into market-oriented systems that emphasize service quality, customers, innovation, efficiency, and competition. Under such pressure, privatization, also referred to as outsourcing and contracting out, has frequently been touted as a mechanism to improve the delivery of government services. The concept has been promoted heavily by politicians, scholars, and practitioners, and while it may have benefits, many observers

have noted the serious difficulties that it may pose. This entry has also highlighted the key pitfalls of privatization and managerial concerns that the practice raises. Having recognized the weaknesses and contingencies of privatization, scholars and practitioners have long been searching for better strategies to sustain the benefits of privatization while minimizing its potential obstacles.

## Definition

Bureaucrats are appointed officers who work under the executive arm of government. They face a dilemma of either being political or apolitical or taking a middle position in the conduct of public business. This paper investigates the nature and extent of this dilemma in the context of Ghana and the consequences which issue therefrom.

## Introduction

Public administration has undergone several paradigm shifts since its birth. The most widely acknowledged paradigms are the traditional model of public administration, the new public management, and the new public governance. Each of these paradigms has been associated with one or more theoretical models about how the public sector should be organized and run to

achieve efficiency and effectiveness. The most important theoretical principle of the traditional model of administration is Weber's theory of bureaucracy. This theoretical model of public administration is characterized by hierarchical organization of government agencies; permanency of staff; neutrality and anonymity of officials, motivated only by the public interest; a view of public administration as a special kind of activity that requires a professional bureaucracy; appointed officers serving any government party equally; and a dichotomy between politicians who are responsible for policy design and bureaucrats whose work is merely to implement those policies decided by politicians (Hughes 2003: 17).

The NPM paradigm is underpinned by profoundly different theoretical foundations of economics and private management. The tenets of NPM include emphasis on results in terms of value for money, to be derived via management by objectives; the use of markets and market-type mechanisms; competition and choice; and devolution to staff through a better matching of authority; and responsibility and accountability (OECD 1998: 13). Among the outcomes of the NPM, reforms have been a significant improvement in public sector ethos and cost savings in some cases. However, there has been weakening of democratic accountability.

Some of the elements of the NPM are both backing and repudiating politicization or partisanship. The NPM aims at changing the culture of the public service with the importation of private sector ideas like improved service delivery, responsiveness, transparency, accountability, merit recruitment, greater autonomy and flexibility for administrators and managers, contract appointments, performance management, new financial techniques, reduction in red-tapeism, and rigidity (Pollitt and Bouckaert 2004). These elements are targeted at depoliticizing the public service to ensure that managers or administrators take responsibility for the achievement of results, a change in political-administrative relationship from master-servant relationship, the beginning of an interactive process between politics and administration, and a redefinition of the relationship between policy making and implementation (Cameron 2010).

Nevertheless, some of the features of NPM also support politicization such as the call for political leaders to choose their agency heads, which may require some sympathy with organizational goals that has the potential of undermining neutrality and nonpartisan administration as postulated by the traditional model of public administration (Hughes 2003). Furthermore, the NPM is seen by political leaders in Australia, the United Kingdom, and the United States as a reassertion of political control over the career bureaucracy (Ayee 2013).

It should be noted that a contemporary paradigm hardly completely supplants an earlier one. Undoubtedly, some elements of the erstwhile paradigm will normally persist alongside tenets of a current one. This is exactly the case with the public administration paradigms where some elements of the traditional model like hierarchy, neutrality, and public interest motivation have transcended the NPM paradigm. Hughes (2003: 3–4) agrees, arguing that paradigms change gradually – the decline of one school of thought occurs as a result of the rise of an alternative.

Ghana has embraced all the above public administration paradigms to varying extents. So if succeeding public administration paradigms hardly ever completely supplant their predecessors and if some paradigms emphasize political neutrality while others eschew and attempt to discard it, then the questions that are provoked are the following: (1) Is the bureaucracy in Ghana politically neutral or partisan? (2) What factors account for the neutrality or partisanship of the Ghanaian bureaucracy? (3) Has the bureaucratic neutrality or partisanship been exercised to the same extent across governments? (4) What are the consequences of the political neutrality or partisanship of the Ghanaian bureaucracy? (5) What measures should be taken to reorient the civil bureaucracy away from partisan concerns toward the public interest?

This paper is arranged such that the first section explicates the concepts of partisanship and neutrality. The second section looks at the bureaucracy during the colonial era. In the third section, the bureaucracy in the post-independence period is examined on the basis of its neutrality or

partisanship across regimes. The fourth section is focused on the causes and consequences of bureaucratic neutrality or partisanship in Ghana. In the fifth section, measures for reorienting the bureaucracy away from partisanship and toward the public interest are suggested. The final section concludes the paper.

## Partisanship and Political Neutrality

The term *partisan* defies a precise meaning as different scholars construe it differently, and this has led to a plethora of definitions. In politics, a partisan is a committed member of a political party or political coalition. In a multiparty system, the term is applied for politicians who strongly support their party's policies and are reluctant to compromise with their political opponents. Partisanship denotes how people identify with a specific political party. Campbell et al. (1960) construe partisanship in *The American Voter* as both a set of beliefs and feelings that result in a sense of "psychological attachment" to a political party. This definition has produced two rival notions of partisanship: instrumental and expressive (Lupu 2013).

The instrumental approach posits that partisanship is running tally of party preferences, ideological beliefs, and proximity to the party in terms of one's preferred policies that is affected by current characteristics of the political environment (Achen 2002). This conceptualization of partisanship is predicated on the rational choice model, which emphasizes utility maximization as the motivating force undergirding political decision making and involvement. In this model, myriad variables like economic evaluations, presidential approval (Mackuen et al. 1989), policy preferences, and party performance, as well as candidate evaluations (Garzia 2013), affect party loyalties and can induce partisans to abandon their party preferences if the party no longer satisfies these instrumental considerations. The instrumental approach to partisanship is appealing because its predictions are generally uniform across members of the electorate and variations in the design of electoral systems. Moreover, the rational voter can base a political decision on either ideological considerations or – in the absence of attitude constraint – a mix of various policy preferences, allowing for flexibility in voters' level of political sophistication and issue intensity.

The expressive approach is articulated by Green et al. (2002) in *Partisan Hearts and Minds*, in which partisanship is taken to mean an enduring identity strengthened by social affiliations to gender, religious, or ethnic and racial groups. These social affiliations with a party and its associated groups promote an emotional attachment to the party, generate stability over time in partisan identification and voter choice, and diminish the political influence of short-term events on party loyalties. Green et al. (2002: 8) describe the process by which people come to identify with a political party as starting with the question: "What kinds of social groups come to mind as I think about Democrats, Republicans, and Independents?" "Which assemblage of groups (if any) best describes me?" rather than with the question: "Which party best represents my political positions?"

While some writers stress the importance of the instrumental approach (e.g., Fionna 1981), others insist on the salience of the expressive approach (Iyengar et al. 2012). In practice, however, there is a likely mix of both approaches.

The rendering of the instrumental and expressive approaches to partisanship is done as if the partisan in all cases is an autonomous agent who can opt in and opt out of a party or be more or less engaged on the basis of his own volition and assessment of his party. I argue that, in the case of at least a partisan bureaucrat, the decision to identify with, and be committed and loyal to, a political party can be forced or manipulated by political bosses. It is possible for political bosses to break the ranks of civil servants by creating a culture of "us versus them," where the "us" refers to top-ranking public administrators who are perceived to be government party sympathizers or supporters who are identified and promoted. They are also given perquisites for the purpose of using their bureaucratic office to promote party agenda through patronage service delivery. They

may also be picked and loftily sponsored both financially and in kind and then imposed on the constituencies they hail from through manipulated primaries to compete as parliamentary candidates. A case in point was when the NDC picked a reluctant Director of the Ministry of Mines and Energy to stand as a parliamentary candidate in the Bosomtwe Constituency (an opposition party stronghold) in the Ashanti Region (Ayee 2013). Although his constituency was one of numerous constituencies in the region with numerous settlements which were not connected to the national electricity grid, he was given special privilege to embark on an elaborate rural electrification project in his constituency in order to gain electoral advantage.

The "them" denotes those bureaucrats who are perceived as not identifying with the ruling government's party. They are usually antagonized and intimidated to make a choice of either falling into line or face transfer to less glamorous departments or sidelined or forced to resign or in worst-case scenarios dismissed. To illustrate, in the 8 years (2001–2008) that the NPP was in power, the "Head of the Civil Service (HoCS) changed multiple times, with no one spending more than 2 years." Others were "designated as 'acting' with no clear timetable for their confirmation or removal" (Adarkwa and Ohemeng 2015: 23). Likewise, when the NDC assumed power in 2009 the HoCS position was subjected to the same turbulence. Such rampant changes make organizations headless that proceed in no particular direction – a state of affairs that is inimical to planning and development.

At the Director level, some bureaucrats who are distrusted by their ministers choose an alternative to quitting, that is, simply succumbing to the wishes of the politicians. The deference to the politician occurs irrespective of whether this offends bureaucratic professional ethos or is inimical to the public interest. Consequently, when an administrative problem crops up, there is passing of buck as it becomes quite formidable to pinpoint who should be held responsible.

The foregoing exposition means that bureaucratic partisanship has four dimensions:

1. Participation in political decision making in the sense that all public administrators are "political" because they are called upon to carry out political decisions, adapt to them, and explain them.
2. Partisan control over the bureaucracy which involves the subjection of the appointment and career of public administrators to political will. In this case, partisanship or politicization means that not only a public administrator's activity but also his or her career depends more on political than professional norms defined by the administration and ruled by law.
3. Political involvement which refers to the degree of public administrators' political involvement as citizens and voters. In other words, is the public service a political force? Public administrators as a group have their own aims and interests. Like any other interest group in society, public administrators are actively involved in the political process in pursuit of class interests (Haque 2001).
4. They are also forced or manipulated to identify with and get politically active in a party.

The opposite of partisanship is political neutrality of the civil service which Olaleye (2001) refers to as bureaucrats putting their politics in their pockets. This implies the task of public administrators is to help in the formulation and implementation of public policy as directed by the political executive. Thus, it is his responsibility to furnish his political boss with all the information necessary to arrive at a right decision. The bureaucrat must present to the elected officer the arguments on all sides to an issue fully, rationally, and fairly. Whatever his own sympathies may be, he must set aside all his/her personal prejudices, sentiments, affinities, and affection and faithfully present all the facts and information at the disposal of the department to enable the political head to take his own decision. Once the decision has been taken, the bureaucrat must loyally carry out the policy chosen even if he has his own reasons to prefer a different course of action. He is also required to make available his past experience to the service of the ministry and to offer

constructive suggestions as developed out of his experience. Moreover, the bureaucrat must execute policies and the substance of programs regardless of the regime in power. This duty emanates from the fact that the concern of the civil service is the good of the nation as a whole, irrespective of the political party in power. The public administrator's responsibility is to present the public interest viewpoint before each political superior who assumes office. Viewed in this way, the civil service ordinarily must strictly adhere to the principle of political neutrality while ensuring the continuity of policy predicated on overall national interest (Ayee 2013).

From the foregoing the question that arises is: Is the Ghanaian bureaucracy partisan or politically neutral or has it blended the two? This question is addressed through tracing the behavior of the bureaucracy from the colonial era to the present time. The implications and lessons of the evidence are then drawn out to inform improved conduct of public business.

## Bureaucracy and Partisanship in the Colonial Era

Colonial rule was imposed on the Gold Coast (name of Ghana before independence) rather than elected or agreed to by the native population. Thus, the colonizers had absolute power to determine public affairs including public policy making. Since the Gold Coast was an appendage or hegemony of Britain, the latter's preferred bureaucratic model was imposed on the former. Although Britain operated on the basis of the Weberian model of political neutrality of the bureaucracy, this approach was not straightforwardly applied to the Gold Coast. This was because the personnel preferences of the Colonial Office – the British ministry responsible for the administration of the colonies – reflected colonial objectives. Bureaucratic positions in the Gold Coast civil service were filled by "patronage," and often candidates were selected for reasons other than ability (Knupland 1953). This practice was known even to some indigenes (Burns 1949). This prompted one Governor of the Gold Coast, Casely Hayford, in 1903 in his condemnation of the colonial system to assert that, "patronage rules the day at Downing Street. . .Consequently there is a class of men who, as human nature goes, would be most obedient, humble, servants of the Colonial Office" (Blakeley 1972: 116–119). Administrative competence was downplayed, while premium was placed on political and personal connections in the selection and career progression in the service. Isichei's description of the colonial civil servant is apt on this non-meritocratic criteria of selection when she elucidates that, "Some [civil servant appointees] were escaping from financial problems or personal unhappiness, some were demobilized soldiers after the World Wars, some saw it as the only choice during the depression years, some were attracted by the prospect of change, adventure and outdoor life" (Isichei 1977: 214).

A similar picture of the nature of the colonial bureaucrat is painted by Kuklick (1979: 33–34) when she states that, for several of the men, service in the colonies "seemed to represent only one in a series of attempts to find exotic adventure." She adds that, "many were obviously escaping from an untenable situation at home," some saw it as "the only avenue open to them," and still others made the choice as an "act of desperation, undertaken only after past failures."

A further account of the quality of colonial civil servants is narrated by Sir Alan Burns, who proposed radical reforms in the colonial regulations that included principles that perpetuated the system of patronage (Burns 1949). He declared some bureaucrats "merely unsuited to colonial life either through temperament or because of indifferent health" (Isichei 1977: 214). Nevertheless, Burns elucidates that civil servants were never dismissed except when they were convicted of a criminal offense. According to him even chronic alcoholics remained on the job, and men who were unfitted for their appointments were routinely promoted (Burns 1949: 167). This was due to the cumbersome procedures required for a bureaucrat to be dismissed and the propensity of the Colonial Office, Governors, and heads of

departments to find excuses for the offenders (Burns 1949).

Kuklick provides additional minutiae to elucidate the human resource management culture in the colonial civil service. She referred to the service as an organization that assessed its "workforce on criteria of "immeasurable skills rather than precise technical accomplishment. . .tending to put a premium on the social graces that the man from a privileged background would possess" (Kuklick 1979: 85–86).

According to Kuklick (1979), officers who had a military background were more likely to get promoted to higher positions in the colonial civil service. The justification for this perhaps was their unique authoritarian style of administration, a style that must have been preferred by their superiors. She reasons that, in the colonial service, recruiters and selectors used their discretion favorably toward applicants whose education stressed "athletic character-building, and were considered to be capable of the visceral judgments and exemplary behavior," quality considered necessary to lead "genuine primitives," while those whose training had put accent on the development of "mere brains were but confined to an office. . ." (Kuklick 1979: 90).

The above exposition indicates that bureaucrats in the colonial civil service were appointed and progressed on the career ladder on the basis of patronage or political criteria rather than meritocratic standards. Thus, they were not the best qualified for the demanding tasks involved in decision making and administration of colonies, some of which were far bigger and more complex than Britain itself (Asante 2005). Consequently, the functional efficiency of the colonial civil service was dismal, geared as it was, toward serving imperial objectives to the detriment of the developmental aspirations of the colonized.

## Bureaucracy and Partisanship in Post-Independence Ghana

Matheson and colleagues in an OECD report concluded that "political involvement in administration is essential for the proper functioning of a democracy." Without this an incoming political administration would find itself unable to change policy direction. However, public services "need protection against being misused for partisan purposes, they need technical capacity which survives changes of government, and they need protection against being used to impair the capacity of future governments to govern" (Matheson et al. 2007: 5). This section examines the civil bureaucracy in the immediate post-independence period in 1957 to date in relation to whether it has been partisan or politically neutral.

The good days of the civil service generally span the period immediately before independence in 1957 to the mid-1970s when civil servants, on whose shoulder the machinery of government essentially revolved, appear to have been well trained and adequately remunerated and resourced. At the same time, the size of the service was "manageable," and security of tenure and the anonymity and neutrality of civil servants were guaranteed. All these factors combined to produce an environment which was congenial and thus elicited in most civil servants the highest degree of performance and productivity.

Despite these reputable, neutral, and professional accolades of the bureaucracy from the late 1950s to the mid-1970s, all was not completely rosy especially during the immediate post-independence period under the reign of Dr. Nkrumah. The desire to achieve rapid socio-economic transformation within the shortest possible time in order to improve the living conditions of Ghanaians necessitated the reorientation of the bureaucracy away from political freedom. This engendered a hostile relationship between politicians and bureaucrats (Amonoo 1981). Elected officials arrogated to themselves the design and execution aspects of the policy making process which made them to have an urge over public administrators in both realms. The alienation of the latter bred resentment and led to distrust between the two categories of officials. The frustration of Dr. Nkrumah especially about the bureaucracy stemmed from the fact that it was considered too slow to act – a perceived characteristic which was thought to be undermining the achievement of the political goal

of rapid socioeconomic development (Gyimah-Boadi and Rothchild 1990). Accordingly, this fed the impetus for the extreme politicization of the bureaucracy, with occupants of the top echelons of the hierarchy being replaced as heads of institutions by party members. This view corroborates Gyimah-Boadi and Rothchild who state that Dr. Nkrumah resolved that, "he would see to it that there were no 'civil masters' as under colonial rule but civil servants carrying out the policy decided by the cabinet" (Gyimah-Boadi and Rothchild 1990: 233). The two scholars assert that "senor officers were regarded with suspicion," which culminated in their loyalty being thrown into question. The Nkrumah's regime ensured that the bureaucracy was firmly brought under the control of the political executive.

An effective strategy Dr. Nkrumah's administration adopted to bring the bureaucracy firmly under political control was the establishment of several parallel bureaucratic apparatuses, to carry out national development (Amonoo 1981). These parallel bureaucratic structures included state-owned enterprises, specialized secretariats like State Planning Commission, the Productivity Center, the Water Resources and Power Secretariat, and the Civil Service Commission. All these institutions were outside the regular public services and brought under the Office of the President, who exercised direct control over appointments (Amonoo 1981). This deteriorated the already frosty relationship between bureaucrats and the Nkrumah's government because it not only over politicized the public service, but it also created coordination problems for it in national development efforts. The coordination problems arose from the fact that some organizations and sectors became silos which grossly undermined sociopolitical and economic growth (Amonoo 1981). Accordingly, an administrative confusion was created for the state, a labyrinth which Amonoo (1981) aptly characterized as "the politics of institutional dualism."

The National Liberation Council (NLC) was the first military regime in Ghana, which toppled the Nkrumah government in 1966. Initially the NLC attempted to depoliticize or is it over politicize the civil service. This is because it made strides to create a cordial relationship with public administrators by substituting politically appointed regional and district commissioners with administrators who were civil servants (Gyimah-Boadi and Rothchild 1990). In respect of economic policy making, the military junta enticed the participation of the bureaucracy in conjunction with the business community in the NLC's National Economic Council (NEC). The council exercised control over economic policies. The membership of NEC included five senior civil servants and two financial professionals. The governing style of the NLC and NEC, according to Kosack (2012), was reminiscent of the approach of the British. That approach ensured that public administrators were at the center and administered the local level via alliances with tribal chiefs and through central appointed bureaucrats.

The NLC appeared not to have the know-how to govern as was remarked by one of its leading members, Colonel Afrifa. He said that, as soldiers they were not cut to govern. Thus, they envisaged that they would serve as a stopgap measure – topple the Nkrumah's regime, put things in order quickly, and hand over power to a civilian-elected government. They had no other program or plans other than overthrowing the Nkrumah's government and installing themselves in power.

For this reason, although the NLC had ultimate power for the conduct of public affairs, it depended almost entirely on the civilian bureaucracy and the intelligentsia as the principal instruments for governing including policy making and implementation (Adu 1965). For the first few months after the 1966 coup, Ghana was virtually managed by civil servants, and this role expanded overtime. Despite the fact that senior military officers were appointed to head government departments and the administrative regions of Ghana and the NLC remained the de jure executive and legislative authority (Baynham 1988), in reality civil servants were the sources of policy ideas. Public administrators were also in charge of converting such ideas into official policies and for their implementation (Asante 2005). In responding to criticisms that the NLC was a government of bureaucrats, Major General Ocran,

another member of the junta, averred that, "I have yet to see a government in any part of the world which does not rely on civil servants for advice or even initiating policies" (Ocran 1977: 88). In digressing he conceded that a government becomes one that is run by civil servants "if those at the helm have no clear-cut policies" (Ocran 1977: 88). This admission goes to buttress the point of Colonel Afrifa that the military was wanting in terms of requisite expertise and skills in the area of government and therefore relied on civil servants to fill the void.

The consequence of the excessive dependence of the NLC military government on civil servants was that it weakened the dichotomy between the realms of politics and administration, which was drawn by Woodrow Wilson. According to him, "Administration lies outside the proper sphere of politics. Administrative questions are not political questions. Although politics sets the tasks for administration, it should not be suffered to manipulate its offices. The field of administration is a field of business. It is removed from the hurry and strife of politics. . ." (Wilson 1887: 209).

In other words, while policies were to be debated and decided by politicians, they were to be carried out by a politically neutral, professional bureaucracy. In this fashion, the everyday conduct of government would be isolated from the potentially "corrupting influence" of politics. The separation has been advocated on the grounds that the "dichotomous division of labor and authority between elected and administrative officials increases the democratic accountability and planning ability of public administrators" (Demir and Nyhan 2008: 81). However, since Wilson's time to date, the politics-administration dichotomy has been one of the most hotly contested theories of public administration. Some scholars describe it as a "myth," while others label it as an "aberration." Most of the academic treatises have concentrated on the interactive relationships between politics and administration as well as on the impact of political interference into democratic government operations (Demir and Nyhan 2008).

The NLC handed over power to the civilian-elected government of Dr. K. A. Busia (1968–1972). Like the NLC regime, technocrats were drafted externally including those who had worked with the World Bank and the IMF (Libby 1978). It was clear that the policy terrain was dominated by politicians and bureaucrats from international governmental organizations, which led to loss of policy ownership by local decision makers (Libby 1978). Despite the over politicization of the bureaucracy under the Busia's government, the period did not record any major strain in the relationship between the elected and appointed officers until the dismissal of 568 civil servants. While the government cited incompetence and inefficiency as the reason for its action, many observers believed they were politically motivated. The political motivation thesis is supported by the fact that a disproportionately large fraction of the dismissed was sympathizers of the Nkrumah's regime. The court order to reinstate the dismissed public servants fell on deaf ears.

The action of the government against the bureaucrats can be interpreted as based on partisan considerations. This is because Dr. Busia was one of the forebears of the United Gold Coast Convention (UGCC), the party that the Dr. Nkrumah-led Convention People Party (CPP) defeated in the election to select the first post-independence government. Dr. Nkrumah had antagonized its founding members to the extent of imprisoning its Chairman, Dr. J.B. Danquah, who died in jail (Gyimah-Boadi 1994). This embittered Dr. Busia and other UGCC leaders and supporters and turned them into vehement critics of the Nkrumah's regime. Not surprisingly, while in power Dr. Busia detested anybody who was aligned to Dr. Nkrumah and his CPP, and so the dismissed civil servants were disliked as well because they supported or were perceived as supporters of Dr. Nkrumah and his CPP.

The Rawlings' military Provisional National Defense Council (PNDC) rule (1981–1992) was a period where the bureaucracy was subjected to political subjugation and threats of annihilation. The process started with the lambasting of bureaucrats for the inefficiencies and ineffectiveness in the conduct of public business and for the socio-economic development problems of the country. This was followed by some structural changes, embracing the redesignation of the position of Principal Secretary to that of Chief Director.

The Chief Director was appointed on the basis of both merit and partisanship. Ascension to the position was no longer to be based on career progression in the service, but government sympathizer-outsiders were also eligible for consideration for appointment (Barnes 2014). The next was the establishment of revolutionary organs. The creation of these organs separated the country into "people" and "citizens," that is, friends and enemies (Oquaye 2000: 69). Those who were construed as "people" were members of the Committees for the Defense of the Revolution (CDRs) and the revolutionary organs including the 31st December Women's Movement (DWM), while those who were viewed as "citizens" embraced the Ghana Bar Association, the Medical Association of Ghana (GMA), the Association of Recognized Professional Bodies (ARPB), the University Teachers Association of Ghana (UTAG), the Ghana Employers Association, and the Masonic Lodges (Oquaye 2000).

Civil servants who were alleged as corrupt were also considered enemies of the revolution. The PNDC envisioned that for the civil service to be effective, it needed a transformation which would remove the bad nuts, reorient its culture, sharpen its skills, and enhance its responsiveness to public service customers. Accordingly, many civil servants were summarily dismissed, while others were accused of corruption and incompetence. Those who were accused of corruption were arraigned before the freshly constituted public tribunals and slapped with long prison sentences (Gyimah-Boadi 1994).

In other words, revolutionary politics distinguished between civil servants who identified with the military regime and those who were considered enemies of it. The civil service was therefore purged of the supposed enemies, and the perceived friends were elevated to positions of decision making. Remnants of the supposed enemy-bureaucrats who remained in the service were sidelined, and this divided the ranks of the civil service and created a culture of "we versus them." The PNDC government accused particularly the supposed enemy-bureaucrats for not only impairing its policies and delays but also described the apex stratum of the service as "allies of imperialism and neocolonialism which should be subjected to revolutionary overthrow and not mere reforms" (Ayee 2013). Accordingly, in the thinking of the PNDC, the civil service should be reorganized and politicized to ensure that its "orientation tallies with the objectives of the Revolution" (Ayee 2013).

The measure of the PNDC is reminiscent of the actions in the United States, whereby President Jimmy Carter promised to "clean up the horrible bureaucratic mess" and President Ronald Reagan vowed to "drain the swamp." In the United Kingdom, Prime Minister Margaret Thatcher introduced the language of public choice theory to top public servants; and in Canada, Prime Minister Mulroney declared that he would offer "pink slips and running shoes to bureaucrats" (Gordon 1992: 3).

The anti-bureaucratic corpus action that the PNDC took against the civil service considerably damaged its effectiveness, prestige, and credibility. The inability of the bureaucracy to perform its functions has led to the lack of trust and confidence reposed in it by most citizens, in turn affecting its perceived legitimacy. It has also affected its overall contribution to national development.

The new democratic dispensation in Ghana was ushered in after competitive multiparty elections in which the National Democratic Congress (NDC) which metamorphosed from the PNDC swept to victory. Ghana thus returned to civilian rule on January 6, 1993 after 19 years under the military dictatorship of the PNDC led by Flight Lieutenant J.J. Rawlings. Since 1993 to date, Ghana has stayed on the democratic trajectory.

There are constitutional provisions that bar civil servants from openly participating in political activities (Article 94 (3b), Article 191). Similar provisions are contained in the Civil Service Law of 1993 and Civil Service Code of Conduct of 1993. Under the last two laws, bureaucrats are supposed to demonstrate neutrality in political affairs. Despite these legal and constitutional provisions prohibiting civil servants from partisan politics, there has been a steady upsurge in the number of public administrators in partisan politics since the return to democratic governance in 1993. In 2009, for instance, there were 68 members of parliament as against 32 in 1993, whose last employment was in the public service. The

numbers may seem insignificant, but the concern is that high-profile bureaucrats either actively campaigned for political parties or stood for primaries without resigning their positions thus compromising their positions as public administrators and giving the public service a negative image and reputation (Ayee 2013: 445). Sometimes depending on who was in power, they were either asked or forced to resign before they contested the elections.

Some of the top-ranking bureaucrats who had involved in partisan politics embraced the Chief Director of the Ministry of Finance; Director, Ministry of Mines and Energy; Director General, National Development Planning Commission (NDPC); Chief Executive, Korle-Bu Teaching Hospital; Executive Secretary, Revenue Agencies Governing Board; Chief Executive, Driver and Vehicle Licensing Authority; Executive Secretary, Food and Drugs Board; Deputy Governor, Bank of Ghana; and Chief Director, Ministry of Health. There were also public administrators from the universities: Education, Health, Internal Revenue, Value Added Tax (VAT Secretariat), and Judicial Services. In addition, on August 6, 2012, K.B. Amissah-Arthur, the then immediate past Governor of the Bank of Ghana – the central bank – was sworn in as Vice President of the country following the ascension of the then Vice President, John Mahama, to the position of President following the untimely demise of President Atta Mills on July 24, 2012 (Ayee 2013: 446).

Several factors are responsible for the increasing bureaucratic partisanship. The first is the empowering provisions in the constitution. For example, the President's power of appointment which is given a further boost by the Civil Service (Amendment) Act 600, 2001 (Republic of Ghana 2001), gives him the power to create ministries and departments of government or redesignate them. In addition, the liberal environment of democratic governance created by the 1992 Constitution stipulates in Article 21 that "All citizens have the right to form or join political parties and to participate in political activities subject to such qualifications and laws as are necessary in a free and democratic society and are consistent with this Constitution," while Article 55 provides that "Every citizen of Ghana of voting age has the right to join a political party."

The second is the politicization of the public service, especially the civil service, by successive governments since independence in 1957. Dr. Nkrumah, Ghana's first head of state, for instance, cautioned that "it is our intention to tighten up the regulations and to wipe out the disloyal elements of the civil service even if by so doing we suffer some temporary dislocation of the service, for disloyal civil servants are no better than saboteurs" (Nkrumah 1961: 173). Glover-Quartey is even more succinct on the partisan tendencies of governments when he bemoans that:

> In Ghana, politicians have sought to directly manage resources—human, financial and material in the Civil Service'. . . They are eager to determine who gets recruited, who gets promoted or how placements are done, and who gets trained and where . . .Ministers and other political office holders . . . have sought to determine who works under them, contrary to the provisions of the Civil Service Law, PNDC Law 327 and the principles of the Service—a politically neutral and unbiased institution managed by the Head of the Service. (Glover-Quartey (2007: 22)

The third is the lack of clarity surrounding the Supreme Court ruling in 2000. On June 6, 2000, the *Ghanaian Times* featured a news piece on page 10 to the effect that the National Democratic Congress (NDC) had accepted the nomination of Kofi Opoku-Manu, the then Chief Director, Ministry of Finance, and Joseph Oteng-Adjei, Director, Ministry of Mines and Energy, as parliamentary candidates for Asante Akim North and Bosomtwe constituencies, respectively, and the two candidates were actively campaigning. The New Patriotic Party (NPP), the leading opposition party, challenged the approval of the two candidates of the NDC at the Supreme Court. That law suit was labeled New Patriotic Party v. the National Democratic Congress and others (Civil Motion No. 36/2000) on June 8, 2000. It sought a declaration that the action was inconsistent with and in contravention of the Constitution, particularly Article 94(3b), which stipulates that "a member of the Police Service, the Prisons Service, the Armed Forces, the Judicial Service, the Legal Service, the Civil Service, the Audit Service, the

Parliamentary Service, the Statistical Service, the Fire Service, the Customs, Excise and Preventive Service, the Immigration Service, or the Internal Revenue Service" is ineligible to be a member of parliament. On November 21, 2000, the majority decision of the Supreme Court held that the NDC's nomination of Opoku-Manu and Adjei did not constitute an act but only a mere intention (Supreme Court of Ghana 2000). This ruling thus fails to clarify whether public administrators should participate in partisan politics or not. This creates a dilemma for public administrators as the highest court of the land failed to rule unambiguously on their participation or otherwise in partisan politics (Ayee 2013).

Other factors for the increasingly bureaucratic partisan tendencies are intimidating influence of politicians and the power imbalance between them and public administrator, job security in the public service as permanent jobs are being replaced by short-term appointments based on contracts, the tradition of guaranteed promotion being undermined by the hiring of skilled private sector managers for top positions, and the personal benefits to be derived by public administrators from taking up political appointments (Ayee 2013; Glover-Quartey 2007).

The Ghanaian scenario can be compared and contrasted with the situation in other jurisdictions. Some countries like France permit partisanship whereby public administrators can contest elections, and if they succeed, they resign their positions. In Spain and Italy, however, public administrators are permitted to take leave of absence to contest elections but may be allowed to return if they are unsuccessful. In some cases, public officials are appointed because they are sympathetic to their government's policies. In some countries like India and South Africa, even though it is stipulated that public administrators who want to engage in partisan politics must resign, the provision has not been enforced because of patronage and the poor enforcement of some policies and regulations in these countries. This is typical of the Ghanaian case (Ayee 2012).

In the United Kingdom, industrial and junior public administrators are allowed to participate in politics, and senior public servants may join a party; but no public administrator is permitted to stand for election to the legislature until he/she has resigned from the public service. The implication is that as in Ghana, a career in the public service is an alternative to and not a preparation for entry to party politics (Ridley 1986). The extreme experience of partisanship, however, is in the United States and China where being a public administrator is not considered incompatible with a political career. In other words, one must have some political sympathies and affiliations before being appointed to a public service office.

A significant equivalent of Ghanaian practice with that of the United States is that a change of government results in a whole set of new senior public administrators. This is the same in the Ghanaian case. The Head of the Civil Service and Chief Directors – the administrative heads of government ministries – had either lost their jobs or redeployed with a change in government since the return to democratic rule in 1993 (Ayee 2013: 447). This practice is certainly not novel as it has been prevalent since independence in 1957. Consecutive regimes either while in office or when they came to office cultivated the proclivity for removing public administrators for several reasons such as the public administrators not supporting their programs and being accused of being too bureaucratic and supporters of the previous government (Glover-Quartey 2004).

The implication of this is that there is an atmosphere of insecurity in the public service which is not conducive to long-term policy formulation and implementation. The turnover of staff in the public service has also created an experience and expertise gap, which has tended to affect the capacity and capability of the public service to deliver its core mandates.

## Conclusion

This paper sought to determine whether and to what extent bureaucrats in Ghana are engaged in partisan issues and the implications of such involvement. The investigation covered the colonial era to the present time. The evidence showed

that there has been an upsurge in bureaucratic partisanship and that this is not novel as it predates the country independence from colonial rule. What distinguishes the current trend is that it is more sophisticated and has become almost a norm because of the country's constitutional and legal framework, the culture of patronage, and global influence such as the experiences of the United States and the OECD countries. The article also found that notwithstanding constitutional and legal provisions prohibiting civil servants from partisan politics, there has been a progressive rise in the number of bureaucrats in partisan politics. In other words, the constitution and civil service legislations have not provided an effective constraint against the partisanship of the bureaucracy in Ghana. Rather, governing parties can potentially, and do, influence bureaucrats to behave in partisan ways.

Bureaucratic partisanship has especially been pronounced at the senior ranks as evidenced by large turnover after changes of governments and by the clear political connection of appointees to positions that are normally part of the permanent civil service. The core structures of the central ministries have generally been less subject to politicization below the senior rank, but there are indications that the politicization of the ministerial bureaucracy is creeping downward increasingly involving the wider, non-managerial civil service.

The Ghanaian experience has once again strengthened the highly charged political environment within which civil servants function and the myth of the politics-administration dichotomy. It has evidenced that the distinction between the political and apolitical has tilted in favor of the former, and more positions that once would have been unthinkable for political meddling are now obviously subject to political intrusion and engagements. Consequently, the legitimacy of the bureaucracy as striving for the public interest has been dented.

## Bureaucracy and Personality

Mokgata Matjie
Industrial and Organizational Psychology Department, University of South Africa (Unisa), Pretoria, South Africa

### Synonyms

Behavior; Bureaucratic; Character; Government; Identity; Max Weber theory; Persona

### Definition

*Bureaucracy*: as a governance system based on strict rules and regulations that renders its organizational functioning independent of the personal qualities of the employees.

*Personality*: defined as the set of consistent or habitual behaviors, cognitions, and emotional patterns that evolve from biological and environmental factors. They are the combination of characteristics or qualities that form an individual's distinctive character.

### Introduction

Bureaucracy is a governance or administration system characterized by strict following of rules and regulations. While this system might work for some employees, it is not necessarily working for all employees due to their different personalities. Its formal structures tend to neutralize the otherwise personal, emotional, irrational, and often political behavior of the humans (Weber 1968).

Personality refers to the long-standing traits and patterns that propels individuals to think,

feel, and behave consistently in specific ways. Every employee or worker is a unique person, and they have an idiosyncratic pattern of enduring, long-term characteristics and a manner in which he or she interacts with other individuals and the world around them. Personality traits are long term, stable, and not easily changed. Hence, rigid rules of bureaucracy may work for other employees but not for others regardless of employment sector or industry.

The word *personality* comes from the Latin word persona. In the ancient world, a persona was a mask worn by an actor to portray or project a specific personality trait of a character. Various personality types exist and those relevant to the effects of bureaucracy one are discussed as follows.

Organizations comprise of people with physical, cultural, and most importantly personality differences. No single leadership style or administration style can satisfy all these different personalities. With that said, any organization needs rules and regulations to ensure control and accountability at all levels. Careful consideration should be taken to ensure that the rules are not the source of poor productivity or low morale of most employees, more especially if there is no flexibility and a gist of autonomy as in bureaucratic governance system.

As a result, it is imperative for bureaucratic employers to understand the impact of such governance style on various personality traits in the workplace as researchers have highlighted and to understand which personality types may fit in and which may not fit in.

## The Big Five Personality Traits

The most dominant approach to represent differences in personality traits is the Big Five concept. The concept is based on the idea that "most of the socially-relevant and salient personally characteristics have become encoded in the natural language" (John and Srivastava 1999). The Big Five were developed in the 1970s by two research teams led by Paul Costa and Robert R. McCrae and Warren Norman and Lewis Goldberg. The 5 factors grew out of decades of personality research, growing from the foundations of Cattell's 16 factors and becoming the most accepted model of personality to date. This model has been translated into several languages and applied in dozens of cultures, resulting in research that not only confirms its validity as a theory of personality but also establishes its validity on an international level. These five factors do not provide completely exhaustive explanations of personality, but they are known as the "Big Five" because they encompass a large portion of personality-related terms. The five factors are not necessarily traits in and of themselves, but factors in which many related traits and characteristics fit.

Hence, this model is used in this context because it has been widely accepted worldwide as reliable factors where traits and characteristics of humans fit and the broad personality dimensions in this model are superior too narrowly defined dimensions. Most importantly the Big Five have been found to relate to job performance if job fit is in place (Barrick and Mount 1991).

A popular acronym for the Big Five is "OCEAN." The five factors are laid out in that order here.

The Big Five are the ingredients that make up each individual's personality. A person might have a surge of openness, a lot of conscientiousness, an average amount of extraversion, plenty of agreeableness, and almost no neuroticism at all. Alternatively, someone could be disagreeable, neurotic, introverted, conscientious, and hardly

open at all. The Big Five personality traits are the result of decades of research trying to boil down an extensive list of expressions used to describe individual characters into a manageable and meaningful taxonomy of personality dimensions. Scholars (Goldberg 1990; McCrae and Costa 1997; John and Srivastava 1999) assert that differences in human personality can be measured on five dimensions, which are described below as follows:

### Openness to Experience

Openness to experience has been described as the depth and complexity of an individual's mental life and experiences. Openness to experience concerns an individual's willingness to try to new things, to be vulnerable, and the ability to think outside the box. Common traits related to openness to experience include imaginative, insightful, wide variety of interests, original, daring, preference for variety, clever, creative, curious, perceptive, intellectual, and complex/deep. An individual who is high in openness to experience is someone who has a love of learning, enjoys the arts, engages in a creative career or hobby, and likes meeting new people. An individual who is low in openness to experience probably prefers routine over variety, sticks to what they know, and prefers less abstract arts and entertainment.

People low in openness are likely to enjoy working in a bureaucratic system with less imagination and new things and to enjoy their habits. Evidently, people with high openness will not survive in a bureaucratic governance or administration system. They will always want to bend or not follow rules due to their personality type or persona.

### Conscientiousness

Conscientiousness is a trait that can be described as the tendency to control impulses and act in socially acceptable ways, behaviors that facilitate goal-directed behavior. Conscientious people excel in their ability to delay gratification, work within the rules, and plan and organize effectively. Traits within the conscientiousness factor include persistent, ambitious, thorough, self-disciplined, consistent, predictable, controlled, reliable, resourceful, hardworking, energetic, persevering, and planner. People who have high conscientious are organized and have a strong sense of duty. They are dependable, disciplined, and achievement-focused. People low in conscientiousness are more spontaneous and freewheeling. A person who is low in conscientiousness is much more likely to procrastinate and to be flighty, impetuous, and impulsive which may tend toward carelessness.

Bureaucratic administration system is likely to work for people with high conscientiousness because they are disciplined and organized, which implies that they are more likely to follow rules. However, those low in conscientiousness personality trait are more likely not to enjoy working under bureaucratic governance system.

### Extroversion

This factor has two familiar ends of the spectrum: extroversion and introversion. It concerns where an individual draws their energy and how they interact with others. In general, extroverts draw energy or "recharge" from interacting with others, while introverts get tired from interacting with others and replenish their energy from solitude. The traits associated with extroversion are sociable, assertive, merry, outgoing, energetic, talkative, articulate, fun-loving, affectionate, friendly, and socially confident. People high in extroversion tend to seek out opportunities for social interaction, where they are often the "life of the party." They are comfortable with others, gregarious, and prone to action rather than contemplation. Those high in extroversion are likely to value achievement and stimulation, and unlikely to value tradition or conformity. Extroverts are often assertive, active, and sociable, shunning self-denial in favor of excitement and pleasure. People low in extroversion are more likely to be people "of few words," people who are quiet, introspective, reserved, and thoughtful.

Highly extroverted people are impulsive and very active, which makes them less likely to follow the rigid, bureaucratic rules, whereas the introverts might to a certain extent follow bureaucratic rules because they are less impulsive, reserved, and thoughtful of consequences before

taking and action. However, caution should be taken not to totally conclude that all introverts could tolerate bureaucratic environment and vice versa with extroverts.

### Agreeableness

This factor concerns how well people get along with others. It is a construct that rests on how people generally interact with others. The following traits fall under the umbrella of agreeableness: altruistic, trusting, modest, humble, patient, moderate, tactful, polite, kind, loyal, unselfish, helpful, sensitive, amiable, cheerful, and considerate. People high in agreeableness tend to be well liked, respected, and sensitive to the needs of others. They likely have few enemies, are sympathetic, and affectionate to their friends and loved ones, as well as sympathetic to the plights of strangers. People on the low end of the agreeableness spectrum are less likely to be trusted and liked by others. They tend to be callous, blunt, rude, ill tempered, antagonistic, and sarcastic. Although not all people who are low in agreeableness are cruel or abrasive, they are not likely to leave others with a warm fuzzy feeling.

In the long term, high agreeableness is related to strong social support and healthy midlife adjustment, but slightly negatively related to creativity. Those who are friendly and endearing to others may find themselves without ample motivation to achieve traditional measure of success, instead focusing on family and friends. Agreeable people are more likely to agree with rules and regulations of the organizations they work for because of lack of creativity. With low agreeableness, they cannot survive in a bureaucratic system because they would lack discipline, and they will be spontaneous and free willing.

### Neuroticism

Neuroticism is not a factor of meanness or incompetence, but one of confidence and being comfortable in one's own skin. It encompasses one's emotional stability and general temper. The following traits are commonly associated with neuroticism: awkward, pessimistic, moody, jealous, testy, fearful, nervous, anxious, timid, wary, self-critical, unconfident, insecure, unstable, and oversensitive. Those high in neuroticism are generally given to anxiety, sadness, worry, and low self-esteem. They may be temperamental or easily angered, and they tend to be self-conscious and unsure of themselves.

The anxiety and self-consciousness component of neuroticism was also linked to values that are more traditional and negatively correlated with achievement values. The hostility and impulsiveness component of neuroticism relates negatively to tradition and conformity. Due to high anxiety and self-consciousness, they are likely to follow rules. However, they might also have another side whereby they become impulsive and hostile when their anxiety is high, thereby not following rules and regulations when required. Anxiety impairs self-esteem, and that has no bearing on their behavior with regard to following rules or not. Neuroticism has also been linked to poorer job performance and motivation, including goal setting and self-efficacy-related motivation. It is likely no surprise that emotional instability and vulnerability to stress and anxiety do not produce one's best work.

## Bureaucracy versus Human Nature

The critics of Weber have raised important considerations about the implication of increased specialization and formalization. Rather than a "reduction of friction," the critics of Weber argued that bureaucracy increases rigidity in the organization. This increased rigidity may result in lowered organizational productivity. Humanist critics argued that bureaucracy curtails individual autonomy and dooms employees to psychological alienation (Bennis 1968). This fear is further magnified by those who invoke "iron law of oligarchy" and by those who see bureaucracy as a means of class domination of employees or workers.

Scholars conclude that bureaucracy or "iron cage" is inevitable for human being because modern society cannot do without its technical benefits as seen in the definition below:

> [Bureaucracy is an instrument of great effectiveness; it offers great economies over unorganized effort; it achieves great unity and compliance. We must face up to its deficiencies, however].

The deficiencies include great waste of human potential for innovation and creativity and great psychological cost to the employees. In this view, bureaucracy appears to employees as a painful trade-off between economic security and wage income on one hand and alienating work content and context on the other.

There is a psychological need for autonomy by the individuals, but bureaucracy does not allow this need to be fulfilled. In addition, such bureaucracy will likely be felt as more constraining in cultures such as the American where an "independence norm" prevails. Bureaucracy may create what researchers call a psychological ambivalence for some people but no social ambivalence. Psychological ambivalence inheres in the individual: it is a function of individual differences in psychological reactions. In contrast, sociological ambivalence inheres in the social structure: here, the source of ambivalence is the incompatible normative expectations of attitudes, beliefs, and behavior assigned to a position by an internally contradictory social structure (Merton 1940).

To add to the inhumane nature of bureaucracy, the following criticisms are labelled against it:

1. Bureaucracy does not adequately allow for personal growth and the development of mature personalities.
2. It develops conformity and "groupthink." Hence, it is too difficult to determine specific individual contribution.
3. Its systems of control and authority are hopelessly outdated.
4. It does not possess adequate means for resolving differences and conflicts between ranks and, most particularly, between functional groups.
5. Communication (and innovative ideas) are thwarted or distorted due to hierarchical divisions.
6. The full human resources of bureaucracy are not being utilized due to mistrust, fear of reprisals, etc.
7. It cannot assimilate the influx of new technology or scientists entering the organization.
8. It modifies personality structure so that people become and reflect the dull, gray, conditioned "organization man."
9. A bureaucratic organization stresses a mechanical way of doing things.
10. Organizational rules and regulations are given priority over an individual's needs and emotions.
11. Not allowing people to use common sense, as everything must be as is written by the law.
12. There is rigidity making decision-making slow or even impossible when facing some unusual case and similarly delaying change and evolution (Bennis 1965).

There are two types of bureaucracies, namely, the negative and the positive views. According to the negative view, the bureaucratic form of organization stifles creativity, fosters dissatisfaction, and demotivates employees. According to the positive view, it provides needed guidance and clarifies responsibilities, thereby easing role stress and helping individuals be and feel more effective. The context of this chapter is on the negative view of bureaucracy which suppresses human nature and turns all humans into machines with no feelings and opinions.

In the midst of the above statement, it is important to mention that there are various notable benefits of bureaucratic governance for humans' nature based on their personalities. However, those benefits are outweighed the possible downfalls for humans in bureaucratic governance system. Firstly, bureaucracy leads to human costs, not only for external clients/subjects but also for employees within bureaucratically structured organizations. Secondly, Merton (1940) argued that working in a bureaucracy induced trained incapacity, timidity, and rigidity. Thirdly, employers see bureaucracy as "authority," or "domination"; thus bureaucracy's key function is to reinforce the domination over employees (Weber 1968). Fourthly, Marxists concluded that the bureaucratization of industry served no productive purpose at all: its function was entirely to

ensure managerial control for intensified exploitation.

## Individual Personality versus Bureaucratic System

Relationship between bureaucracy and personality is dependent on the personality traits of the workers. There are employees whose personality structure is built around order and structure and who are comfortable knowing exactly what is expected of them and who thrive on rules and regulations. Bureaucratic organizations are best for people for whom thinking outside the box is not part of the job description as shown on the table below. However, the employees who are creative, innovative, spontaneous, and freewheeling and employees who enjoy autonomy and independence cannot function effectively under the bureaucratic governance system and leadership style.

Highlighted below is the relationship between various personality traits and their chance survival in the bureaucratic system in terms of nature of a certain personality trait (Table 1).

Individuals who value innovation and those who enjoy autonomy, bureaucracy may not seem like an appropriate governance setting or leadership style. Scholars argue that bureaucracy undermines employees' commitment and fosters dissatisfaction by limiting innovation. They also conclude that bureaucracy is an ineffective form of organization for dealing with innovation, change, and environmental complexity.

Despite the identified ills of bureaucracy on personality, there are people who appreciate bureaucracy. Bureaucratic personality is based upon respect for organizational rules and regulations. Unlike authoritarian person, bureaucratic person's acceptance of authority is not total and blind. A bureaucratic person values subordination, conformity to rules, and impersonal and formal relationships. These people are not innovative. They do not like taking risks. They are better supervisors when the type of work is routine, repetitive, and proceduralized. This discussion on bureaucratic personality leads to discussion of bureaucratic leadership style.

## Bureaucracy as a Leadership Style

Theories of the bureaucratic personality hold that personal characteristics of certain bureaucrats make them prefer elaborate rules and regulations. Yet some organizations really do need more rules, as indicated by the bureaucratic organization

**Bureaucracy and Personality, Table 1** Link between "The Big Five" personality types and bureaucracy

| Big Five personality trait | Level | Can such an individual survive within bureaucratic system? |
|---|---|---|
| Openness | High | No (creative, wants to try new ideas and things) |
| | Low | Yes (prefers routine, not creative) |
| Conscientiousness | High | Yes (organized, disciplined) |
| | Low | No (spontaneous and freewheeling) |
| Extroversion | High | No (prone to action, active, impulsive) |
| | Low (introversion) | Yes (thoughtful, reserved) |
| Agreeableness | High | Yes (low creativity, likely to agree with rules) |
| | Low | No (low conscientiousness) |
| Neuroticism | High | Yes (anxiety and self-consciousness = follow rules) |
| | | No (impulsiveness and hostility = cannot follow tradition and conform) |
| | Low | N/A |

model that predicts that characteristics of the organization determine members' preferences for rules. Prominent theories of bureaucracy also suggest that bureaucratic personalities should be more prevalent in public institutions. Important to note is that leaders in public organizations have what is termed "bureaucratic personalities," due to their lack of competence, skills, and experience to perform duties. As a result, they need rules and regulations to confine employees to and to ensure that efficiency and effectiveness prevails.

Merton (1940) assumes that personal characteristics of leaders influence their preference of bureaucratic leadership style, hence "bureaucratic personality." Bureaucratic personalities are found in individuals who have an inherent need for constraints and regulation due to their lack of competence or experience (political appointees). The need for bureaucratic personality stems from personal insecurity of leaders, which gives rise to managerial efforts to exert control over public policies beyond any reasonable degree (Thompson 1961).

Weber, a German sociologist, described six principles that define bureaucratic leadership in the late nineteenth and early twentieth centuries. He described bureaucratic leadership as:

1. A strict hierarchy that is formalized by the leadership and strictly adhered to.
2. The organization is controlled by immutable rules, regulations, or laws.
3. The organization is structured along the lines of specialties. People with similar talents are grouped together.
4. The organization has one of two missions, "up-focus," meaning it focuses on the board of directors or stockholders, and "in-focus," which means the organization serves a product-oriented goal such as increasing profit market share.
5. Bureaucratic leadership is impersonal. It is about performance, not the worker.
6. Employment is based on the most technically proficient.

The bureaucratic leadership style is mainly used in established companies or governments that want to become more efficient and more effective. Mostly leaders who do not like to micromanage the organization, but rather choose to delegate tasks, knowing that the organization's structure is in place to support his requests, use it.

Here are some of the characteristics of bureaucratic leadership:

- Combines a top-down management style with strict adherence to policies and procedures within an organization.
- Leaders are empowered by the offices they hold and are held accountable to the next level in the hierarchy.
- The organizational structure is rigid and often has strict delineation of tasks and authority.
- Bureaucratic leadership does not require that the top leadership have personal influence on the organization, because regardless of who is the top executive, the rest of the organization is in place and can run itself, if need be.

## Conclusion

Bureaucracy demands reliability by pressuring officials to be methodical, prudent, and disciplined while exhibiting an unusual degree of conformity to rules and regulations (Merton 1940). Not all human beings will be able to conform and operate within bureaucratic realms. As such, organizations should be able to accommodate individuals with personalities not compatible with bureaucratic rules and make measures available necessary to allow for flexibility.

There are individuals who enjoy working in bureaucratic organizations. Scholars conclude that professionals or specialists who work in bureaucracies lack the autonomy, which is vital for successful performance. They are free to practice their profession or expertise but within confined rules and regulations that might hamper their decisions and freedom. Autonomy on the individual level is defined as the

professional's self-control over both his decisions and his work activities within a particular work setting, or his freedom to deal with his client, other than being bound by rules of bureaucratic organizations.

Organizations, either public or private, are complex and goal seeking. To achieve their goals, they need to maintain their internal systems and coordinate the human side of the organization, a process of mutual compliance called reciprocity. This implies that the organizations promise to treat employees like human beings in exchange for their performance and loyalty.

# Bureaucracy and Personality: Does Employee Ethnicity Matter?

Dennis Gabriel Pepple, Eleanor Davies and Julie Davies
Huddersfield Business School, University of Huddersfield, Huddersfield, UK

## Synonyms

Behavior; Character; Civil servant; Cultural background; Public sector

## Definitions

Bureaucracies are the fabric upon which society is organized. They are the functional arm that implements government programs and policies.

Societies comprise of people from diverse ethnicities. Ethnicity represents various ways of identifying people with respect to their cultural heritage.

Personality explains the characteristics that make an individual unique. Example of such characteristics includes the individual's ethnicity.

## Introduction

Bureaucracies affect every stage of the existence of an individual: from the stage of birth and in most instances death (hospitals) to the stage of learning and skills development (educational institutions) (Cohen 1970). Bureaucracies also play a significant role in society as the single largest employer of labor in most countries. In view of the significance of bureaucracies for societal existence, there has been a growing call for such organizations to mirror the society where they operate. This has resulted in more ethnically diverse public sector workforce (Pepple et al. 2017).

This increase in ethnically diverse workforce has led to a challenge of influencing employees' shared interest with their organizations (Brown 1999). Within organizations, especially public sector bureaucracy, employees that perceive themselves as being discriminated as a result of their ethnicity tend to feel demoralized and lose confidence in the system (Brown 1999). In most multiethnic countries, individuals consider themselves in the light of their ethnic groups or extended family, and loyalty to it comes first in the scheme of things (Agbiboa 2012). This ethnocentric consideration is evident within all spheres of life including work. This warrants a need to study how to shift employees' individual or ethnic group loyalty to that of a shared interest with their organization.

To attract employees' shared interests, there is a need to understand an employee's personality. Employees' personality encompasses the way they regularly think, feel, and behave such that it is predictable and consistent over time (Hamidullah et al. 2016). Current organizational psychologists suggest that attracting an employee's shared interest in an organization involves an emotional attachment to such organization sometimes referred to as psychological ownership (Dawkins et al. 2017). Psychological ownership posits that ownership is a means of defining one's self, one's possession, and one's territorial boundary. Psychology of possession is innate in every individual such that they sometimes define themselves by what they possess (Peng and Pierce 2015). Possession may be material or immaterial, and the effect of ownership perception may reflect in employees' personality (behavioral, emotional, and psychological patterns) (Peng and Pierce 2015).

Employee personality as conceptualized in this study explains how employees think, feel, and behave in the like manner of owners of their organizations. This form of employee personality may be referred to as employee psychological ownership personality. Extant psychological ownership literature suggests a three-model factor of employee ownership personality, known as the roots to psychological ownership: employee efficacy, employee identity, and employee voice (Peng and Pierce 2015). Efficacy as an ownership personality trait is used to explain the need for one to have control over one's possession, while employee identity trait underpins the notion that possessions serve as a means of self-identity; this is as a result of the value placed on an object or possession (Peng and Pierce 2015). Employee voice trait explains the need for individuals to own a territory such that they can invest themselves in the organization, as well as come to intimately understand the organization (Peng and Pierce 2015). Employees with psychological ownership personality define themselves by their organization, such that the success or otherwise of their organization reflects on them. They are willing at every opportunity to defend their organization by their actions and speak well of it.

Drawing on the above background and psychological ownership theorization, this study aims to investigate how employees' psychological ownership personality is influenced by ethnic identification such that they develop a shared interest with their organization. The rest of this chapter is structured as follows: first, the chapter presents theoretical expectations for each of the three-model factor of employee ownership personality and their relationship with ethnic identification. Secondly, the scales that are used to measure the variables are reported. Findings from data analysis are presented in the third section. The tables in this section are products of field data collected for this study. Discussions and conclusions are presented at the end.

## Theoretical Expectations

Empirical literature is presented in this section of the chapter based on the theorization of employee psychological ownership personality and ethnic identification. Discussions are drawn from extant studies to support the propositions for linking ethnic identification at work to the three-model factors of employee ownership personality.

## Employee Ethnic Identification and Coworker Social Support

Within multiethnic organizations, employees feel a deep sense of commitment to their ethnic heritage (Barron et al. 2011). This involves employees making effort to get to know their ethnic background better, as well as the values and emotional significances of being part of their ethnic group. Thus, employee ethnic identification involves employees' behavioral manifestation of their ethnic heritage (Barron et al. 2011). Employees feel more comfortable to display their ethnic identities when they are among fellow employees of same ethnic group. The challenge that arises, however, is how they are perceived when they relate with others outside their ethnic group (Barron et al. 2011).

As a consequence of the manifestation of different ethnicities at work, managers need to take steps to avoid discriminatory or prejudicial behaviors among employees. Thus, rather than resulting in discrimination and negative treatment, ethnic identification may result in prosocial behavior among employees of different ethnic groups. This is because employees who feel like they are not differentiated because of their ethnicity respond favorably with each other. Such favorable responses include supporting each other, treating each fairly, and a cordial exchange between employees and their supervisors/managers. Also, social support within an organization has been observed to prohibit other relational challenges such as interpersonal unfairness, workplace incivility, and discrimination (Barron et al. 2011). This study therefore suggests that employees' ethnic identification will result in prosocial behavior and make the following proposition:

**Proposition 1** Employee ethnicity identification has a direct positive relationship with coworker social support.

## Ethnic Identification and Interpersonal Fairness

In this study, interpersonal fairness describes employees' reaction to perception of fair treatment that employees receive in their organization as a result of their ethnic identity (Yang et al. 2013). Employee ethnic identification explains the prosocial behavior within the organization because of employee outward manifestation of their ethnicity. Employees that perceive that they are not discriminated because of their ethnicity tend to feel a sense of acceptance and belonging at work. Organizations are therefore at risk if employees perceive that they are not cared for or supported at work. This is because employees that sense ethnicity-based discriminatory behavior may feel devalued and alienated from the organization. Thus, while employee ethnicity identification may result in prosocial behavior, its effect may be limited by employees' perception of interpersonal fairness.

A common concept underpinning employees' shared interest as suggested by Yang et al. (2013) is the issue of interpersonal fairness. This is a situation where an employee perceives the organization to treat everyone fairly and in a respectable manner. Existing studies show that interpersonal fairness enables employees to focus attention to get work done and reduces conflicts arising from attribution, thus identifying themselves with their organization (Yang et al. 2013).

**Proposition 2** Interpersonal fairness mediates the relationship between employee ethnicity identification and coworker social support.

## Coworker Social Support and Employee Ownership Personality

This study defines coworker social support as the willingness of colleagues to cooperate and help each to better perform their jobs and improve their relationships (Consiglio et al. 2016). Building on the theorization of employee ownership personality three-model factors, efficacy is further explained as the belief or expectation that employees will feel creative and competent if they perceive the social context within the organization to be supportive. Recent studies from (Consiglio et al. 2016) indicate that perception

of social context highlights a strong relationship with employee's feeling of efficacy. Employees that experience support from their colleagues may also identify with their organization. Voice behavior may also be associated with support from colleagues, as employee may be motivated to return the favor to their colleagues by helping them improve their work.

Social context is also important for fostering an environment that enables employees to cope better with stressors at work. Employees are able to assert personal control of their work and achieve assigned task following each ones' willingness to share their knowledge and expertise and the provision of support and encouragement to one another (Consiglio et al. 2016). Thus, the following is expected for the relationship between coworker social support and the three-model factors of psychological ownership personality traits:

**Proposition 3** Coworker social support has a direct positive relationship with employee efficacy, employee identity, and employee voice.

## Rationale for Linking Ethnic Identification to Psychological Ownership Three-Model Factor of Employee Personality

Existing studies suggest that ethnic identification may result in employees' shared interest with their organization, such that overtly ethnic-identifying employee feels, thinks, and behaves like they own their organization (Pepple et al. 2017). The relationship between employees that display ownership personality at work and ethnic identification is currently unknown (Pepple et al. 2017); hence, it is not surprising that scholars argue as to the efficacy of ethnic identification for employee personality.

In line with the theoretical expectations highlighted in Propositions 1–3, this study presents a fourth proposition to explain the relationship between ethnic identification and the three-model factors of psychological ownership personality. The expectation from Proposition 1 is that ethnic identification may lead to coworker social support, with Proposition 2 explaining the rationale for Proposition 1 by highlighting the mediation roles of interpersonal fairness. Proposition 3 illustrates the relationship between coworker social support and the three-model factors of employee ownership personality. Given the framework illustrated in the above theorization, it is therefore apt to suggest as follows:

**Proposition 4** Coworker social support mediates the relationship between employee ethnicity identification and employee efficacy, employee identity, and employee voice.

## Description of Participants

A total of 1500 survey booklets were distributed to employees working in 9 public sector organizations in Rivers State, Nigeria. Of this number, 1203 questionnaires were returned. Upon screening of the returned questionnaires, 295 of them were not usable for the following reasons: incomplete filling, having more than one answer to a question, and inconsistent response with questions reworded or reversed. At the end of the data screening exercise, only 908 questionnaires are used for analysis in this study.

A summary of the description of the participants are as follows: 89% of the employees were origins of Rivers State, while the rest were Nigerian citizens but not from Rivers State. Rivers State is divided into 23 local government areas (LGA). The organizations sampled were fairly representative of the various LGAs in the state. This is in line with the federal character principle (FCP) practiced by public sector organizations in Nigeria (Adeosun 2011). FCP mandates all government-owned organizations to employ people from various LGAs in a state (Adeosun 2011). Another interesting characteristic of the sample is the number of years that employees have worked for the organizations. About 70% of them have been employed for over 5 years. This implies that majority of the respondent had a good working knowledge of the employee relations issues presented in the survey instrument. Of the employees surveyed, 53% fall within the senior staff

category, while about 14% are at the managerial levels. It is also important to note that over 50% of the participants have been on their current position for more than 5 years. Although not planned, the sample has a balanced gender distribution, with 59% males and 41% females. The sample also shows that the participants had higher levels of education, with over 50% having a bachelor's degree or higher.

### Measures of Variables

The scales used to measure the variables in this chapter are adapted from validated studies that are mostly used within the field of study. For employee ethnic identification, the study adopts a revised multigroup ethnic identity measure (RMEIM) scale proposed by Phinney (1992). The study adopts the coworker social support scale provided by Caplan et al. (1975, pp. 251–252) to investigate support from colleagues variable. While general self-efficacy scale by Sherer et al. (1982) is used to investigate employee self-efficacy, organizational self-identity is measured using organizational identification (OID) scale by Mael and Ashforth (1992). Lastly, employee voice is measured using Farh et al. (2004) voice scale.

### Determination of Measurement Model Adequacy

Six different measures are adopted in this study to determine the adequacy of the theoretical model. They include computation of minimum discrepancy (CMIN/DF), incremental fit index (IFI), Tucker-Lewis coefficient (TLI), comparative fit index (CFI), and root mean square error of approximation (RMSEA) (Storm and Rothmann 2003). Findings from Table 1 summarizes the results alongside outputs that are generally considered as good fit for the different measures. The results show that the model is adequate as it conforms to the various measures used to determine its adequacy.

### Determination of Model Validity

In addition to the above analysis that confirms that the model is adequate, discussions in this section aim to ascertain the extent to which the items used represent the unobservable variables in the construct (Hair et al. 2012). The questionnaire sent to respondent is made up of statements that should collectively represent the variables in the theoretical framework. Two methods utilized in this study that are frequently used to determine construct validity are average variance extracted (AVE) and composite reliability index (CRI) (Hair et al. 2012). The rule of thumb is for AVE results to be $\geq$0.50. The minimum value generally accepted for a reliable construct is CRI $\geq$ 0.70. The values of coefficient of Cronbach's alpha, AVE, and CRI for the variables ranged from 0.75 to 0.92, thus confirming the validity of the constructs used in the analysis.

## Results

The analytical approach is straightforward: with the aid of repression analysis, this chapter presents findings on how ethnicity influences employees' psychological ownership personality. This result section is divided into three. First, direct relationship between ethnic identification and three models of psychological ownership personality is presented. Next, the chapter test for the mediating role of coworker social support, and, lastly, interpersonal fairness is introduced to explain the rationale for the relationship between ethnic

**Bureaucracy and Personality: Does Employee Ethnicity Matter?, Table 1** Determination of Model Fit

| Measures | CMIN/DF | IFI | TLI | CFI | RMSEA |
|---|---|---|---|---|---|
| Model output | 4.4 | 0.94 | 0.93 | 0.94 | 0.04 |
| Acceptable fit | $\leq 5 > 1$ | Closest to 1 | Closest to 1 | Closest to 1 | $\leq$0.05 |

identification and coworker support. Investigating the relationships in this order will make it easy to ascertain the mediating effects of coworker social support and interpersonal fairness.

## Direct Relationship between Ethnic Identification and Psychological Ownership Personality

The following findings are presented in relation to the three models of psychological ownership personality and employee ethnic identification: for efficacy trait, the relationship between employee ethnic identification and employee efficacy is negative such that an increase in employee ethnic identification results to a decrease of 0.30 in efficacy trait. The adjusted incremental $r^2$ is marginal at 0.06, with a $p$-value less than 0.05. This suggests that although the negative relationship is significant, the change in efficacy trait as a result of ethnic identification is low. Secondly, for employee voice trait, ethnic identification has a positive relationship with an estimation regression weight of 0.39. The adjusted incremental $r^2$ is 0.13, with a $p$-value less than 0.05. This suggests that the relationship is significant and positive. Thirdly, with regards to self-identity trait, the regression estimate for ethnic identification relationship is 0.38 and $p$-values less than 0.05. With an incremental $r^2$ of 0.12, this suggests that the relationship is significant. See Table 2.

## Mediating Role of Coworker Social Support

Upon determining the direct relationship between employee ethnic identification and the three models of psychological ownership personality traits, this section provides findings on the mediating role of coworker social support. Findings show that employees' ethnic identification positively influences coworker social support. The relationship is significant with regression estimates of 0.41, with a $p$-value less than 0.05 and an incremental $r^2$of 0.15. Proposition 1 therefore holds. The results also show that the introduction of coworker social support reduced the regression estimates of the relationship between employee ethnic identification and three models of psychological ownership personality traits. For example, repression estimates for employee voice and organizational self-identity reduced from 0.39 and 0.38 to 0.30 and 0.30 for prior and post introduction of coworker social support, respectively. Efficacy traits also reduced from −0.30 to −0.22. With a $p$-value less than 0.05 for this relationship, findings show that coworker social support significantly and partially mediates the relationship between employee ethnic identification and the three models of psychological ownership personality traits. It is important to note that the introduction of coworker social support in the framework increases the adjusted incremental $r^2$ for all three models of psychological ownership personality traits as follows: 0.14, 0.17, and 0.09 for self-identity, voice, and efficacy, respectively. In view of this result, Proposition 3 is supported partially as coworker social support relationship to psychological ownership personality is positive only for self-identity and voice. However, because the introduction of coworker social support reduced the direct effect of ethnic identification on all three traits of psychological ownership personality, Proposition 4 is therefore supported. See Table 3.

**Bureaucracy and Personality: Does Employee Ethnicity Matter?, Table 2** Direct relationship model

| Relationship between variables | | | Estimate | S.E. | C.R. | P | $r^2$ |

| Employee voice | <— | Interpersonal fairness | 0.069 | 0.028 | 2.452 | 0.014 | |

## Mediating Role of Interpersonal Fairness

Results here are presented to provide a rationale for the relationship between ethnic identification and coworker social support and by extension the three models of psychological ownership personality traits. First, on the relationship between ethnic identification and interpersonal fairness, findings show that employee ethnic identification is positive related to interpersonal fairness with estimated regression weight of 0.36, with an adjusted incremental $r^2$ of 0.08, and a $p$-value less than 0.05. Next, interpersonal fairness positively influences coworker social support with estimated regression weight of 0.24. The adjusted incremental $r^2$ for coworker social support increased to 0.24 as a result of the combined effects of ethnic identification and interpersonal fairness. Furthermore, the estimated regression weight of employee ethnic identification and coworker social support reduced following the mediation of interpersonal fairness from 0.40 to 0.32, thus, suggesting that interpersonal fairness partially mediates the relationship between employee ethnic identification and coworker social support. Extending the effect of interpersonal fairness to the three models of psychological ownership personal traits, the results show the effect of ethnic identification on psychological ownership further reduced from 0.30 to 0.29, 0.30 to 0.29, and −0.21 to −0.18 for employee, self-identity, and efficacy, respectively. These increases are marginal as the effect on the adjusted incremental $r^2$ was not noticeable. Proposition 2 therefore holds. See Table 4.

## Discussions, Contributions, and Implications

In this exploratory study, this chapter affirms that indeed, ethnicity matters for the formation of psychological ownership personality traits in employees. Generally, findings show that employee ethnic identification explains a fairly large percentage of changes in psychological ownership personality, with a range between 12 and 13 percent for voice traits and self-identity traits, respectively. See Tables 3 and 4. This study provides evidence to support the need for scholars and practitioners to focus on employees' ethnicity. This is especially for bureaucracies that operate within multiethnic societies. There are existing studies that show that ethnic identification forms core part of employee personality, and as such understanding how to deal with different ethnic identities at work will be of great benefit to organizations (Oruwari et al. 2004). Results from this study suggest that within bureaucracies that have multiethnic employees and where such employees perceive that they are accepted and not differentiated, they may display voice and organizational identification personality traits. Results from this study also suggest that the negative consequences of having multiethnic employee composition may be countered within a work climate that promotes interpersonal fairness and coworker social support.

The concept of psychological ownership personality is apt in investigating how to influence employees working in public sector organizations within the empirical context of the study. In Nigeria, there is a sense of entitlement toward government organizations. The notion is that the government belongs to everyone, thus, the struggle by the federating states and LGAs to have employee quotas in government bureaucracies (Adeosun 2011). Employees unintentionally have psychological ownership personalities. However, their feelings and actions are in most instance geared toward improving the lots of their regions. This study suggests that employees with such strong inclination to their ethnicity when treated fairly and accepted may exhibit coworker social support and display their psychological ownership personality traits to favor their organizations.

The findings presented in this chapter are not without some limitation. For example, the context wherein the study was conducted is highly collectivist, and people attach much importance to ethnic identification in terms of their region of heritage (Oruwari et al. 2004). However, if similar studies are conducted using the region to delimitate ethnic identity in another location such as Western countries with less collectivist ideology, the results may be different. Such limitation does not fault the findings from this study especially because of the methodological rigor underpinning the results. Future studies are solicited from a different context to enable comparison of outcome and to make inferences on the effect of context.

In conclusion, this chapter makes a case for public administration scholars and practitioners to focus on employees' ethnicity at work. The result has shown that it is worthwhile to examine how the strength of ethnic diversity influences employees' perceptions, attitudes, and behaviors, specifically its positive effect on self-identity and voice. As the call for representation of various ethnic groups at work continues to grow, scholars and practitioners must continue to investigate several ways of influencing employees' personality traits that favor the organization and ensure that discriminations associated with multiethnic settings are mitigated. One of such ways is already alluded to in this chapter.

# Bureaucracy and Policy Alienation

Lars G. Tummers
School of Governance, Utrecht University, ZC, Utrecht, The Netherlands

## Synonyms

Anomie; Change cynicism; Identification; Resistance to change

## Definition

Policy alienation can be defined as a cognitive state of psychological disconnection from the policy program to be implemented.

## Introduction

Public service workers often have problems with new policies. This ranges from teachers striking against school reforms, professors protesting against cost-cutting in higher education, and physicians feeling overwhelmed by a constant flow of policy changes, resulting in conflicts and burnouts.

An illuminating quote – cited in a leading Dutch newspaper – comes from an insurance physician who had to implement stricter rules for work disability insurance, causing many former citizens classified as work disabled to lose their benefits, while nothing substantially changed in the situation of these citizens:

> The UWV [Dutch organization for employees' insurance] is nowadays called the Lourdes of the North: you visit the agency as work-disabled, you leave able to work… It is becoming extremely controversial. I cannot reconcile it with my conscience anymore.

When public service workers cannot identify with a policy, this can has severe consequences. It can negatively influence policy effectiveness, as

public service workers do not execute the policy or even try to sabotage it. Furthermore, public service workers themselves can become dissatisfied with their work. Some public service workers even experience burn-out or quit their jobs entirely.

Although identification problems have been acknowledged by public administration scholars (see, for instance, Lipsky 1980), there was no coherent, theoretical framework for analyzing this topic. Therefore, Tummers et al. (2009) developed the "policy alienation" model, building on the concept of work alienation developed in the field of sociology. Policy alienation can be broadly defined as a general cognitive state of psychological disconnection from the policy program to be implemented. Tummers et al. (2009) developed five dimensions in the policy alienation model, which can serve as explanations for low compliance with policies. This focus on attitudes of public service workers fits within a new direction for public administration research, where a shift is being witnessed from a focus on structures, through processes, to a focus on attitudes and behavior of public service workers (Grimmelikhuijsen et al. 2017).

Various scholars have used this model or particular policy alienation dimensions (for instance, Loyens 2016; Thomann 2015; Van der Voet et al. 2017). In general, they showed that the policy alienation model can be useful for studying public administration topics. It has been shown that effects of high policy alienation include reduced change willingness (Tummers 2011) or commitment (Van der Voet et al. 2017) and even clear resistance and rule breaking of policies (Tonkens et al. 2013). More generally, Thomann (2015) showed that policy alienation can lead to lower policy performance. Loyens (2014, 2016) shows various effective and ineffective ways to cope with policy alienation. Next to this, Van Engen et al. (2016) studied the concept of "general" policy alienation. Instead of alienation from a specific policy, the "general" policy alienation concept can be used to study identification problems with governmental policies in general.

This essay in the *Global Encyclopedia of Public Administration, Public Policy, and Governance* has three goals. First, it aims to discuss the background and development of the policy alienation model. Second, it shows how policy alienation can be measured via surveys or interviews. Third, this essay has the goal to indicate valuable future theoretical, methodological, and empirical research directions for scholars interested in further developing this line of research. To achieve this, this essay connects the study of policy alienation with core debates and concepts in public administration, including Public Service Motivation and red tape. By pursuing these three goals, this essay aims to help practitioners who are interested in using the policy alienation model to understand and improve policy implementation in their organizations. Next to this, it aims to provide scholars with a clear overview of the policy alienation model and lacunas in the field, which they can use when designing new studies.

## The Policy Alienation Model

Alienation broadly refers to a sense of social estrangement, an absence of social support or meaningful social connection. Its use in scientific literature can be traced directly to Hegel and Marx, who both saw capitalism as the main cause of alienation. Karl Marx concentrated on objective work alienation: workers are alienated when they do not own the means of production or the resulting product.

Sociologists, public administration scholars, and other social scientists have since used the alienation concept in various studies, thereby building upon Marx. However, these scholars differ in one important aspect from Marx. While Marx looked at objective work alienation, contemporary scholars examine *subjective* work alienation: alienation as *perceived* by the worker. Scholars have used the subjective alienation term in various analyses, and a number of meanings have been attributed to the term. In an attempt to provide clarity, Seeman (1959) – in a landmark

article – broke these meanings down into five alienation dimensions: powerlessness, meaninglessness, normlessness, social isolation, and self-estrangement.

In line with Seeman, policy alienation can also be considered as multidimensional, consisting of powerlessness and meaninglessness dimensions. In essence, powerlessness is a person's lack of control over events in their life. Meaninglessness, on the other hand, is the inability to comprehend the relationship of one's contribution to a larger purpose. Public service workers can feel powerless while implementing a policy. For instance, a police officer might be required by his superiors to issue a minimal amount of tickets each day, with no room to deviate from this. Linked to this, it is also evident that public service workers can feel that implementing a policy is meaningless if, for example, it does not deliver any apparent beneficial outcomes for society, such as decreasing the number of burglaries in your neighborhood. In making the dimensions more specific to the situation under study, the policy alienation model distinguishes between strategic, tactical, and operational powerlessness and between societal and client meaninglessness. The definitions of these dimensions – including examples – are shown in Table 1.

Next to focusing on alienation from a specific policy, public service workers can also be alienated from governmental policies in general. Public service workers are often confronted with various policies over time, intended to adapt, replace, or complement existing policies. Based hereon, public service workers will have a certain predisposition toward governmental policies in general, just like predispositions toward the public sector. To conceptualize this predisposition, Van Engen et al. (2016) introduced the term *general policy alienation*, which can be defined as a cognitive state of psychological disconnection from policy programs to be implemented in general. Hence, next to alienation from a specific policy (see Table 1), public service workers can also be alienated from policies in general (Table 2).

To illustrate the importance of general policy alienation, Van Engen et al. use an example of a month long strike of 5000 Norwegian teachers. This strike did start as a reaction to the introduction of a new controversial government proposal that orders teachers to spend 7.5 h of working

**Bureaucracy and Policy Alienation, Table 1** Defining the five dimensions of policy alienation (Based on Tummers 2011)

| Dimension | Definition | Examples of high scores |
|---|---|---|
| Strategic powerlessness | The lack of perceived influence by public service workers on decisions concerning the content of the policy, as is captured in rules and regulations | A public service worker feeling that the policy is drafted without the help of implementing public service workers or their associations |
| Tactical powerlessness | The workers' perceived lack of influence on decisions concerning the way policy is implemented within their own organization | Public service workers stating that the managers in the organization did not consult them or their colleagues when designing the implementation process for the policy |
| Operational powerlessness | The perceived lack of freedom in making choices concerning the sort, quantity, and quality of sanctions and rewards on offer when implementing the policy | Answering "fully agree" to a survey question on whether the public service worker felt that their autonomy during the implementation process was lower than it should be |
| Societal meaninglessness | The perception of public service workers concerning the lack of value of the policy to socially relevant goals | Stating in an interview that "I agree with the policy goal of enhancing transparency, but I do not see how this policy helps in achieving this goal" |
| Client meaninglessness | The workers' perceptions of the lack of added value for their own clients in them implementing a policy | A public service worker who argues that a particular policy seriously impinges on their clients' privacy |

**Bureaucracy and Policy Alienation, Table 2** Defining the five dimensions of general policy alienation (Based on Van Engen et al. 2016)

| Dimension | Definition | Examples of high scores |
|---|---|---|
| Strategic powerlessness | The influence that public service workers usually perceive themselves as having on decisions concerning the content of government policies as captured in rules and regulations | A teacher feeling that the government drafts education policies without involving teachers |
| Tactical powerlessness | The influence that public service workers usually perceive themselves as having on decisions concerning the way (new) government policies are implemented within their organization | A teacher stating that the school leader does not involve teachers structurally in designing the implementation of government policies within the school |
| Operational powerlessness | The influence that public service workers usually perceive themselves as having during the actual implementation of government policies | A social worker answering "totally agree" to a survey question asking if autonomy during the implementation of government policies is usually lower than it should be |
| Societal meaninglessness | The perception of public service workers concerning the added value of contemporary policy to socially relevant goals | A physician stating in an interview that contemporary health policy is, in her opinion, not contributing to a healthier society |
| Client meaninglessness | The perception of public service workers concerning the added value of contemporary policy for their own clients | A police officer noting that, overall, contemporary education policy has detrimental effects on the safety in their assigned neighborhood |

time at school each day. However, the strike was about more than that. Months before the strike started, the Norwegian teachers voted against another government proposal because they perceived it as a threat to their professional autonomy and their ability to deliver high-quality education. The President of the Union of Education of Norway therefore also stated that "This strike is about much more than the compulsory seven and a half hours teachers should spend daily at school." This statement is in line with the conceptualization of general policy alienation as a state of mind reflecting accumulated past policy experiences.

Based hereon, Van Engen et al. show how the policy alienation framework can be used to study *general* experiences with public policies, instead of experiences with a specific policy. Do public service workers have the impression that they can, in general, influence the shaping of government policies? Furthermore, do they have the impression that government policies are, in general, meaningful and add value for society as a whole and for their own clients? This is shown in Table 2.

## Measuring Policy Alienation

For both (specific) policy alienation and general policy alienation, measurement instruments have been developed. Sound measurement is crucial in each empirical study. We will first discuss measuring policy alienation via questionnaires. Hereafter, we show how policy alienation can be measured when conducting interviews.

Scales have been developed for the dimensions of both policy alienation and general policy alienation. To specify these scales to the context, "template" words are used. Templates allow researchers to adapt items to their specific situation by replacing general phrases with more specific ones: ones that fit the context of their research. For example, instead of using the terms "the policy," "organization," and "public service workers," the researcher can rephrase these items to suit the specific situation, for example, replacing them with "the new financial policy Alpha," "institution," and "mental healthcare professionals." As an example, one of the template items for tactical powerlessness was:

> In my *organization*, *public service workers* could take part in conversations regarding the execution of the *policy.*

In an example, this becomes:

> In my *institution*, *mental healthcare professionals* could take part in conversations regarding the execution of the *new financial policy called "Alpha."*

Scholars and practitioners who want to use the policy alienation items in a survey should decide which template terms are appropriate. All items use a five-point Likert scale ranging from strongly disagree, through disagree, neutral, and agree to strongly agree.

In Table 3, we show the items for one dimension (societal meaninglessness) for both policy alienation and general policy alienation. In this way, the reader can get an idea on how to measure policy alienation dimensions. For all scales, please see Tummers (2012) for policy alienation and Van Engen et al. (2016) for general policy alienation. For instance, in a recent study in *Public Management Review* Van der Voet et al. showed that societal and client meaninglessness were highly negatively related to commitment to change.

Next to developing specific measures for the different dimensions, Van Engen (2017) also developed a *short* measure of general policy alienation. Here, she follows the guidelines for general scale development. Multidimensional measures – like the ones developed by Tummers (2012) and Van Engen et al. (2016) – are usually seen as yielding a more nuanced understanding of the different origins or forms of a concept. However, short scales can also be valuable. The first reason for developing a short measure of policy alienation is that the current multidimensional scales (5 scales of each around 5 items) take up survey time that researchers could otherwise use to measure additional variables. Second, the length of the measure may prohibit its application to other fields of public administration where policy alienation is not the core subject matter, but could form a relevant antecedent, effect, or moderator. In sum, the advantage of a short measure is that it allows researchers to use just a few items to assess frontline workers' overall level of general policy alienation. They do not have to include the full range of policy alienation dimensions.

Based on two studies in the education sector, Van Engen developed a short scale of general policy alienation, which is shown below and can be used in future studies. This is shown in Table 4.

Next to quantitative survey studies, qualitative studies have been conducted to study the degree of policy alienation, its antecedents, its effects, and how to cope with policy alienation (Loyens 2014; Loyens 2016; Tummers et al. 2012; Thomann 2014). For instance, Loyens (2014) studied how public service workers cope with the tensions and frustrations that result from policy alienation. This is an interesting study, as it shows how public service workers can effectively deal with policy alienation. She uses a comparative case study design of labor inspectors and

**Bureaucracy and Policy Alienation, Table 3** Measurement of client meaninglessness for policy alienation and general policy alienation

| **Client meaninglessness – Policy alienation (for studying attitudes toward a specific policy)** |
|---|
| 1. With *government policy X* I can better solve the problems of my *clients* (R) |
| 2. The *government policy X* is contributing to the welfare of my *clients* (R) |
| 3. Because of *government policy X*, I can help *clients* more efficiently than before (R) |
| 4. I think that *government policy X* is ultimately favorable for my *clients* (R) |
| **Client meaninglessness – General policy alienation (for studying attitudes toward government policies in general)** |
| 1. In general, *government policy* enables me to better solve the problems of my *clients* (R) |
| 2. In general, *government policy* contributes to the welfare of my *clients* (R) |
| 3. In general, *government policy* enables me to help *clients* more efficiently (R) |
| 4. Overall, I think *government policy* is ultimately favorable for my clients (R) |

Note: Answer categories: Likert scale (fully disagree, disagree, neutral, agree, fully agree)
Template terms are underlined, these can be adapted to fit the research context, for instance, replacing "clients" by "patients" in a healthcare setting

**Bureaucracy and Policy Alienation, Table 4** Short measure of general policy alienation (Based on Van Engen 2017)

| Item template | Item applied in education setting | Item drawn from dimension |
|---|---|---|
| 1. *Public service workers* cannot influence the development of *policies* at the national level (Minister and Ministry of *X*, National Government) | School leaders and teachers cannot influence the development of education policies at the national level (Minister and Ministry of Education, National Government) | Strategic powerlessness |
| 2. Generally, I have freedom to decide how to use government *policies* (R) | Generally, I have freedom to decide how to use government education policies | Operational powerlessness |
| 3. Overall, I think that government *policy* leads to *socially relevant goal A* (R) | Overall, I think that government education policy leads to higher educational quality | Societal meaninglessness (1) |
| 4. In general, I think that government *policy* in the long term will lead to *socially relevant goal A* (R) | In general, I think that government education policy in the long term will lead to higher educational quality | Societal meaninglessness (2) |
| 5. In general, *government policy* enables me to better solve the problems of my *clients* (R) | In general, government education policy enables me to better solve the problems of my students | Client meaninglessness |

police officers in Belgium. She showed that labor inspectors and police officers use five coping styles to deal with the alienation they experience from implementing the Belgian asylum and migration policy. The first two are acquiescence (for instance, accepting that you can't really make a difference) and emotional habituation (for instance, noting that you just have to "get tougher" to deal with difficult policies). These ways of coping are forms of "positive feedback": they keep the often high degree of policy alienation intact. The other three are forms of "negative feedback": they *lower* the degree of policy alienation. One example is "bonding with the victim": public service workers bend rules and try to work together with the citizens to work out solutions.

Loyens and others measured policy alienation via interviews. When conducting interviews, a semi-structured interview protocol can be used. As with a structured interview, a set of themes is selected in advance. However, unlike a structured interview, a semi-structured interview is flexible, allowing new questions to be raised during the interview based on the answers from a respondent. The exact content of the interview will depend, among other things, on the research question, the policy and the sector involved, and on the individual characteristics of the interviewer and interviewee. Below I show some example questions from the semi-structured interview protocol for policy alienation, with a focus on the degree of policy alienation and its influencing factors. For the elaborate guidelines, readers can consult Tummers (2013, pp. 157–167, Table 5).

**Bureaucracy and Policy Alienation, Table 5** Sample questions for studying policy alienation and its antecedents using an interview

| |
|---|
| *Strategic powerlessness*<br>Do you think you, as a group of public service workers, could influence decisions concerning the content of *policy X*, as is captured in national rules and regulations?<br>What do you think are the main reasons for this? |
| *Tactical powerlessness*<br>Do you think you, as a group of *public service workers*, could influence decisions concerning the way *policy X* is implemented within you own organization?<br>What do you think are the main reasons for this? |
| *Operational powerlessness*<br>Do you feel that, when implementing *policy X*, you have sufficient autonomy?<br>What do you think are the main reasons for this? |
| *Societal meaninglessness*<br>What do you think are the goals of *policy X*?<br>To what extent do you agree with these goals?<br>Do you feel that *policy X* contributes to achieving these goals?<br>What do you think are the main reasons for this? |
| *Client meaninglessness*<br>Do you feel that you can help your own *clients* better as a result of *policy X*?<br>What do you think are the main reasons for this? |

## Conclusion and Future Research Suggestions

The previous two sections discussed, respectively, the background of the policy alienation model and the way it can be measured quantitatively and qualitatively. The goal of this final section is to show future theoretical, methodological, and empirical research directions for scholars interested in further developing this line of research.

A first area for future research is the relationship between policy alienation and important concepts in the field of public administration, such as *Public Service Motivation*, red tape and policy performance. For instance, Public Service Motivation can be connected to the meaninglessness dimensions of policy alienation. PSM can be described as the motivational force that stimulates people to perform meaningful public service. It is conceivable that PSM moderates the relationship between meaninglessness and willingness to implement (see also Van der Voet et al. 2017). For example, if public service workers feel that a policy does not contribute to society (a high societal meaninglessness) while they have a high commitment to serving this public interest, they might be less willing to implement such a policy. However, if they do not have a strong commitment to serving the public interest, this relationship might not hold. Then, other factors may be more influential in explaining their willingness to implement. Combining the policy alienation and PSM concept can be a worthwhile topic for public administration scholars to address.

Next to this, researchers could further analyze the relationship between policy alienation and the policy performance. It has been shown that policy alienation has a negative influence on behavioral support for that policy. Related to this, it would be interesting to investigate the effect of policy alienation on actual policy performance (see also Thomann 2014). A multimethod approach could be fruitful here. Researchers could use interviews or survey techniques to determine the public service workers' level of policy alienation. Using another source, researchers could then examine the actual policy performance of these public service workers when implementing the policy. This observed policy performance could then be related to the level of policy alienation. Alongside being of theoretical interest, this could also be very relevant for policymakers who need knowledge on the factors that affect policy performance.

The second suggestion for future research addresses methodological issues. The current literature is dominated by studies relying on cross-sectional studies and interviews. The value of these methods is that they are located in real organizational environments. However, these methods do not allow scholars to truly determine the causal direction of the relationships. Longitudinal studies and especially experiments – in the lab or in the field – can be useful here. A future study could for instance develop an experiment showing how policy alienation can be reduced via extensive communication or granting more autonomy to public service workers. More in general, future studies can conduct such studies to address the concerns about causality. Scholars can follow guidelines on the use of experiments in the public administration discipline (for instance, Jilke et al. 2016).

The final suggestion for future research is empirical. Most policy alienation studies have been focused on Western countries, including the United States, Germany, Belgium, Switzerland, and the Netherlands. Almost no studies have been conducted in developing countries or Eastern countries. It would be valuable to study the measurement of policy alienation, its antecedents, and its effects in such different settings. Does the measurement scale hold when applying it to other countries? Are the same effects found? Are effect sizes comparable? In this way, the generalizability of the policy alienation model would be tested further. More in general, scholars can conduct replication studies (also in Western countries). Replication is one of the core tasks of science and is increasingly valued in the last years.

Concluding, it is of paramount important to understand why public service workers are reluctant to implement new policies. Embracing and further researching the attitudes of these public service workers toward new policies should

prove to be a timely and productive endeavor for both scholars and practitioners alike.

## Synonyms

Complementarity; Neutral competence; Politicization; Politics-administration

## Definitions

| | |
|---|---|
| Politics | This involves the use of state authority and [discretion] to determine how policies, decisions, and resources target particular groups or sectors (perhaps and not others) in a political system at any given time. It determines who gets what, how and when in society done in explicitly or implicitly depending on the context. |
| Administration | It is largely a process which involves the interaction between humans and other resources to help make and enforce government programs and decisions in an effective, efficient, and more professional manner. Although is it largely professional in approach and process, administration is both technical and political |

| | |
|---|---|
| | process since it requires some major decisions over competing resources, conflicting options, and coalitions. |
| Complementarity | It stresses interdependency, reciprocal influence, and extensive interaction between elected officials and administrators along with recognition of the need for distinct roles and political supremacy. Complementarity argues for a synergy and partnership between elected officials and public administrators towards the pursuit of public good and effective service deliver (Svara 2001). |
| Politicization | Politicization of civil service basically entails the substitution of political criteria for merit-based criteria in the selection, retention, promotion, awards, and disciplining of members of the public service which could easily jeopardize bureaucratic integrity (Peters and Pierre 2004). |
| Neutral competence | It admonishes bureaucrats to execute "the work of government expertly, and [carry it out] according to explicit, objective standards rather than to personal or party or other obligations and loyalties". Due to the practical complementarity between politicians and bureaucrats, neutral competence in contemporary times entails expert analysis carried out by professional civil servants, enjoying an unclear degree of independence from political bosses. |

*The conflict between professional and political values ….; are they really contradictory or complementary? These two contending perspectives do not have to be contradictory; in fact, they can and should be complementary, one reinforcing the other. (Farazmand 2002, p. 137)*

## Introduction

The exact relationship between civil servants and politicians has been one of the most contentious issues in public administration (PA). It is perhaps within this context that some scholars describe the politics-administration debate as a "myth" or "aberration" (Overeem 2012). PA scholars hold the view that one of the most critical issues confronting the modern state is how to find a way to strike a balance and symbiotic relationship between politicians and the bureaucrats, who are key elites in the governing process. To Farazmand (2009), from the ancient times to the present, politicians and bureaucrats have been at the heart of PA. A harmonious relationship between politics and administration strengthens the legitimacy of the governmental system, while acrimonious relationship tends to undermine the legitimacy of the entire political system.

The civil service exists to rationally implement public policies of the executive so as to ensure the continued working of government. An efficient civil service hinges on the quality and professionalism of its members and leadership. This depends on certain conditions applicable in public personnel management, the most important of which involves an objective criterion to determine recruitment into, promotion, transfer, and termination of appointments in the civil service. For instance, Heclo (1977) provides that the civil service idea has rested on three basic principles, namely (i) that the selection be based on merit, that is, the capacity to perform as opposed to favoritism or patronage; (ii) that tenure be stable and not susceptible to

change as rampant as every regime change; and (iii) that civil servants be responsive to any government of the day as a price to pay for the job security enjoyed. This is a perfect criterion to address dysfunctions in service delivery and developmental challenges, especially, in developing countries. An empirical research on bureaucracies of 35 less-developed countries concluded that meritocratic recruitment is the most important structural feature for improving bureaucratic performance (Evans and Rauch 1999). The idea is that opting for meritocratic recruitment reduces politicization and patronage while making way for competence and professionalism with virtues that create value for people [state].

This entry contributes to the topical discussion on the neutrality-politicization syndrome by using a developing administrative system, Ghana. Ghana is a member of the Commonwealth and the first sub-Saharan African country to obtain political independence. The country has made advances in democratic consolidation with political power and earned an enviable position as a shining example of democracy in Africa. Ghana has also embarked on major reform programs in its administrative system. The Civil Service Reform Programme (CSRP) between 1987 and 1993 ostensibly sought to remove all obstacles that affected the service's ability to operate as an agent of change and progress whilst Civil Service Performance Improvement Programme (CSPIP) in 1995 was an effort to make for a rational, competent, and more productive civil service.

This article examines the principle and practice of *neutral competence* and politicization in the public service of Ghana. What is the relationship between politicians and bureaucrats or civil servants? What are the dilemmas in the relationships between politicians and civil servants in the developing administrative context? What should politicians think of civil servants and what should the civil servants do to adapt to their situations and positions? What is the implication of a flawed relationship between the two? These relevant questions are implied and addressed in the study conclusions.

## Theoretical Overview

### The Politics-Administration Dichotomy and Civil Service Neutrality

The principle of civil service neutrality emanates from the politics-administration dichotomy debate. The question of how to position PA in relation to politics bears important implications for both the intellectual identity and institutional development of PA (Henry 2004).

Demir and Nyhan (2008) state that the politics-administration dichotomy was meant to minimize the influence of politics in public administration by calling for expertise and neutrality in the management of government business. Henry (2004) contributes to the debate by positing that "the field's founders had harbored no qualms about the wisdom of differentiating public administration from the *hoi polloi* of politics because they firmly believed that only a knowledgeable, noble elite (that is public administrators) could pull the people from their pestilent cistern of civic suffering and into the light of prosperity and progress" (Henry 2004, p. 34).

Scholars report the difficulty in putting into practice the theoretical assumption that seeks to make an explicit distinction between politics and administration; Svara (2001) therefore argues for a mutually interactive, partnership, and complementarity approach that will ensure effective collaboration between politicians and administrators in public service delivery. According to the interactive approach, bureaucrats and politicians ought to and must work together, and their relationship should be cooperative, to promote efficient and effective governance (Farazmand 2009).

### Politicization: A Threat to Neutral Competence?

When faced with reality, political actors tend to view civil service neutrality as just an ideal and in most cases consider it as a mere metaphor provides that: "all theory is metaphor. Any theory or perspective that we bring to the study of organization and management, while capable of creating valuable insights, is incomplete, biased and potentially misleading."

The paradox of civil service neutrality is seen in terms of the perceived politicization of the civil service. Peters and Pierre (2004) view politicization as "the substitution of political criteria for merit-based criteria in the selection, retention, promotion, awards, and disciplining of members of the public service" (p. 2). Politicization, thus, connotes the notion of making appointments, dismissing employees, and making personnel decisions based on partisan political machinations. This results in patronage conceptualized to mean a situation where appointments and promotions become based on familiar relationships especially political party affiliations.

## Consequences of Politicization

An overarching effect is that a highly politicized public service distorts all ideal conceptualizations and benefits to be derived from a neutral competent civil service.

It is well argued that for the purposes of formulating and implementing complex public policies that are capable of creating conducive environment for development, a neutral civil service is required. Heclo (1977) discusses that a career civil service represents the institutionalization of continuity. Pfiffner (2007, p. 420) contends that "career civil servants have experience with what happened the last time something was tried, how members of Congress are likely to react, what realities of implementation are likely to spoil the boss's great new idea and so on" as well as promotes continuity with its institutional memory and provision of expert advice. Politicization will make this elusive as new governments mostly sideline these people and hire their own sympathizers with implication on public service delivery.

Secondly, if public service personnel functions are minced with partisanship, sycophancy, and patronage, it tends to undermine the merit-based principle of employment and promotion, efficiency, and professionalism. This results in weakening trust in the political system, loss of expertise, low morale among existing public administrators and widening the gap between senior public servants and rank and file (Cameron 2010). Commenting on the view that senior appointments in the civil service are political in nature, Gainsbosrough (2006) points out that even though civil service appointments are in theory merit-based, "the majority of senior appointments are political appointments, and for lower-level appointments nepotism and the buying of positions are common" (p. 22). Little drops of politicization set a stage for a debilitated civil service which may lead to a less productive and dysfunctional state machinery in the long term. For instance, Zafarullah et al. (2000) observe in Bangladesh that by the 1990s "the bureaucracy had become clearly factionalized along party lines; some senior civil servants openly defying the government with others lending their support. The former were punished by demoting them to trivial positions, while the latter were rewarded for their services with jobs in important ministries" (p. 47).

Again, with this practice, public personnel management becomes tattered as officials instead of using performance appraisal and competence as the basis of promotion, the managers and HR officials have often relied on political considerations, patronage, and corruption in determining the hierarchical advancement of civil and public servants (see Zafarullah et al. 2000). When politicization interferes in performance of public personnel functions – appointment, promotion, training, transfer, posting, and termination – without recourse to objective, rational, and merit principles, it leads to square pegs in round holes. Such phenomenon deteriorates efficiency and overall national development. Making a case on the delicacy of public personnel functions, Wriston maintains, "I believe the only game in town is the personnel game; my theory is that if you have the right person in the right place you do not have to do anything else, but if you have the wrong person in the job, there's not a management system known to man that can save you" (cited in Foulkes and Livernash 1982, p. 43). Moynihan and Roberts (2010) provide useful insights on the consequences of nonmerit appointments [wrong person in the job] from the US context. They observe that the Bush administration got involved in various nonmerit recruitments for instrumental reasons, which made the public service exhibit various counts of incompetence. They put

forward that "the damage to competence was perhaps best typified by Michael Brown, the head of the Federal Emergency Management Agency (FEMA), who resigned after the dismal response to Hurricane Katrina. Brown and other senior appointees in FEMA lacked emergency management expertise, but had significant political campaign experience" (p. 575).

Finally, politicization in personnel functions becomes dreadful because civil servants may tend to view party loyalty as a safeguard for promotion and continuity; there is a high tendency to jettison their professional values and neutrality which will affect overall public sector productivity, damages work ethics, erodes internal discipline, and seriously undermines the servicer's image in the society (Siddiquee and Faroqi 2010). Again, empirical studies indicate that merit-based recruitments are less prone to corruption (Evans and Rauch 1999); this suggests that nonmeritocratic criteria such as political considerations, nepotism, and favoritism could largely breed corruption and formation of clandestine rackets and networks for cover ups (see Yeboah-Assiamah et al. 2016).

## Methodology

The entry adopts cases from Ghana's public service from Kwame Nkrumah's era [first Republic] to contemporary period [fourth Republic] to assess the neutrality-loyalty maze in personnel functions of Ghana's public sector. We however draw much emphasis on the fourth Republic by discussing relevant provisions in the 1992 Republican Constitution and relate them to practicalities on the ground with relevant cases. The study essentially relies on primary data including government documents and reports as well as face-to-face interview with 15 key respondents selected from the civil service of Ghana. Other secondary sources of data including journal articles, newspaper publications, Internet sources, and book chapters were beneficial to the discussion. Although mostly touted as civil service *neutral competence*, in our illustrations we expand the scope to cover other sensitive public service positions (approach used by Moynihan and Roberts 2010). Consequently, we discuss the civil service within a broader context of public service; the term "public administrators" connotes the higher and lower echelons of the public services of Ghana as stated in Chapter 14 of the 1992 Republican Constitution. Article 190 (1) identifies the civil service as one of the fourteen Public Services. These public services include:

(a) Civil Service; Judicial Service; Audit Service; Education Service; Prisons Service; Parliamentary Service; Health Service; Statistical Service; National Fire Service; Police Service; Immigration Service; Legal Service; Customs, Excise and Preventive Service; Internal Revenue Service *[the final two plus a Value Added Tax Service merged to form Ghana Revenue Authority in 2009 by Ghana Revenue Authority Act 791]; [there is also a Local Government Service, Act 656 of 2003]*
(b) Public corporations other than those set up as commercial ventures
(c) Public services established by this Constitution
(d) Such other public services as Parliament may by law prescribe (Ghana 1992)

## Discussion: Contextual Analysis of Public Service *Neutrality-Politicization* in Ghana

### Recruitment into the Public Service

Although on paper public personnel processes in Ghana require merit considerations, the criteria to get entry into the civil service, transfer and promotion decisions, and termination in most cases reflect social and political consideration. Politicians and bureaucrats use the state to reward themselves and their supporters with lucrative jobs and juicy contracts. In Ghana, the politicization of the public service began in the First Republic when Dr. Kwame Nkrumah encouraged some top public servants to join the Convention People's Party (CPP), the party in Government at the time. Indeed some top officials of the public service were dismissed without recourse to the public service rules and regulations. Since then, the over-politicization of the civil service has

continued unabated, thus affecting the neutrality of the civil service.

The PNDC government, under Jerry John Rawlings, blamed the civil service for sabotaging its policies. Rawlings regarded the top echelons of the service as: Allies of imperialism and neo-colonialism which should be subjected to revolutionary overthrow and not mere reforms (Ghana 1982, pp. 5–6).

In the opinion of the PNDC, the civil service should be re-organized and politicized to ensure that its "orientation tallies with the objectives of the Revolution" get recruited (Ghana 1982, p. 5). This trend has continued unabated in contemporary public administration of Ghana. In an interview with a key official at the Ministry of Tourism, she explained that:

> The president may use recruitment as a tool of reward. Some make it so glaring... I cannot bootlick, so I remained in the same level for over so many years in my previous place of employment. I know people who have bootlicked and have been repeatedly promoted. For me I see that as an unfair way of rewarding or even punishing people.

The above was given support by another participant who narrated an incident she had witnessed in a previous place of work. She maintained:

> They pretend to be neutral... it was out of order for one to demand political party cards before appointing a worker in my former place of work. People in the same party align themselves to each other.

However, one respondent from the Ministry of Employment and Labor Relations attempted to be magnanimous in his submission but ended up detailing how such political machinations could occur. He tried at length to give the theory behind recruitment [what ought to be], but towards the end of submission, he brought out the reality [what is]. He explained that:

> Minister of State doesn't have that right to appoint or transfer a civil servant. In an abnormal case, a Minister may have to write and apply to the civil service authority giving reasons if he or she wishes to have a civil servant transferred elsewhere. In short, the politicians do not have any direct role to play in who gets transferred or promoted.

The submission above was forcefully brought home by an interviewee who explained the processes politicians mostly go through in their attempt to influence personnel processes of the public service. He added that:

> Politicians don't appoint people to the civil service but the OHCS [Office of Head of Civil Service]and PSC [Public Service Commission]... even when the politician appoints, the person appointed faces a vetting committee and based on their performance they are either given the role or not.... But in my opinion, there is the possibility of political undertone.

Another interviewee from the Ministry of Tourism corroborated the argument above by responding affirmatively that:

> I think to a large extent politicians influence recruitment into the civil service. They cannot directly control the process because of the structures. However, who eventually gets recruited can be influenced by the politician... persons who participate in the recruitment process usually are people presented by politicians....because it is usually a formal process, others who have no links with politicians also participate. Eventually, those who have links with the politicians often get recruited.

The above narratives provide support to the argument that there are some political undertones in the recruitment processes into the civil and public service of Ghana.

## Loyalty-Competence Maze: A Political Expediency Choice?

The preference for loyalty to competence in Ghana's public service is not a recent development but could be traced back to the first Republic. Discussing the importance of civil servants loyalty to the government of the day, Dr. Kwame Nkrumah, for instance, explicitly declared his preference for loyalty over competence by making it public that "it is our intention to tighten up the regulations and to wipe out the disloyal elements of the civil service, even if by so doing we suffer some temporary dislocation of the

civil service, for disloyal civil servants are no more than saboteurs" (Nkrumah 1961, p. 173).

Public service requires competence and patriotism; however, political leaders mostly tend to place more priority on political expediency and what appears personal loyalty [or perhaps *praisesinging*] even at the expense of competence. For instance, the appointment of a novice who appears to have no clue in disaster management as deputy national NADMO [National Disaster Management Organization] coordinator left many policy analysts and civil society organizations dumbfounded. Demonstrating his dismay about the deputy's incompetence, the national coordinator of NADMO fumed that *"apart from distributing relief items, 'xxx' [name withheld] has no knowledge or expertise in disaster management, at NADMO we work on nuclear, geological and man-made disasters and 'xxx' [name withheld] has no knowledge about these… they should ignore all the technical people and say 'xxx' go and do it but we will not sit down for that to happen because she does not qualify for the job"* (http://sankofaonline.com/archives/24563). In another instance, the late President Mills appointed a Commissioner for the Commission on Human Rights and Administrative Justice (CHRAJ), who although had legal qualifications had not adequately practiced her law in the Ghanaian setting and also appeared very naïve about her new working environment (http://citifmonline.com/2014/09/17/lauretta-not-qualified-for-chraj-job-gyimah-boadi/). What made her appointment questionable was that the President appeared to have contravened the rules to make the same individual sit on the Ghana Commercial Board concurrently (http://citifmonline.com/2014/09/17/lauretta-not-qualified-for-chraj-job-gyimah-boadi/) which appeared contrary to Article 222 of the 1992 Constitution which prohibits a Commissioner of CHRAJ from occupying any other public office. This discussion resembles an observation in the US context by Moynihan and Roberts (2010) who noted that in the Bush Administration, "so long as politicization was considered to be valuable for instrumental reasons,… inexperience or incompetence grew unacceptably large. Over time…strategy of politicization was transformed into dogma… applied for its own sake, and without regard to potential risks" (p. 575).

This is not surprising because political officials in most cases have their own definition of identifying people "loyal to them," their definition connotes perhaps those who may easily compromise their professional calling to act sycophantly at the beck and call of the appointing authority. Demonstrating his preference for loyalty, perhaps over competence, the Ex-President Kufour contends that although competence and experience are ideal values, he would rather opt for people who are loyal to him. This was in a sharp rebuttal to his former finance minister [sacked] who in delivering a lecture on the topic "*Ghana's Developmental Challenges: Perspective on the Roles of Competence, Loyalty and Sycophancy*" suggested that "we must be able to identify real loyalty from that of loyalty through sycophancy and praise singing, it is high time we placed emphasis on competence and the best available human capacity, skills and experience (http://www.ghanaweb.com/GhanaHomePage/features/Osafo-Marfo-on-competence-and-loyalty-166645)." Although the position held by Kufour is not necessarily an aberration, the argument is how do we determine one's loyalty? In his classical conceptualization, Menninger posits that "loyalty means not that I am you, or that I agree with everything you say or that I believe you are always right, loyalty means I share a common ideal with you and that regardless of minor differences, we fight for it, shoulder to shoulder, confident in one another's good faith, trust, constance and affection" (quoted in Manser 2001, p. 239). In the case of Ghana, political leaders and governments in most cases would want to hear sweet and praiseworthy words from people and groups (http://www.ghanaweb.com/GhanaHomePage/NewsArchive/Mahama-Ghanaians-have-very-short-memory-295218). One is easily touted an ally of the opposition if she/he critiques or provides platform for critiquing government policies or decisions (http://newsghana.

com.gh/ndc-exposes-prof-yankah-iea-et-al-says-they-are-npp-surrogates/; http://elections.peacefmonline.com/pages/politics/201505/241480.php?storyid=100&). In most cases, individuals who speak in favor of [sometimes sycopantly] to political parties are viewed as loyal, whereas objective and indifferent people become questionable and suspects. We argue that even if one is competent but shrouded in "praisesinging" and sycophancy to leadership [presidency], she/he is likely to fail in office because at the end of the day, it is not the competence that drives the appointee, but the presidency and how to please personality that urges him on. This ideal appears missing in the study context; in a discussion with a key interviewee from the Ministry of Tourism, he explained:

> . . .. I cannot bootlick, because of that I remained in the same level for over so many years in my previous place of employment. I know people who have bootlicked and have been repeatedly promoted. For me I see that as an unfair way of rewarding or even punishing people. . . The focus rather turns to be more of loyalty. This is seen often in times when people have just been elected into power or they are just about leaving power.

**Bureaucracy and Politicians Agenda: Examining Politics-Administration Relationship in Ghana, Table 1** Some public servants dismissed by President JA Kufour under the NPP Government

| Name of public/civil servant | Position of public/civil servant |
|---|---|
| Dr. P. K. Kuranchie | Managing director, agriculture development Bank (ADB) |
| Mr. Paul Adom | Commissioner, internal revenue service (IRS) |
| Mr. Charles Asare | Director-general, social security and National Insurance Trust (SSNIT) |
| Mr. S. Appiah-Ampofo | Chief executive, National Insurance Commission (NIC) |
| Mr. Ebenezer Allotey | Managing director, state insurance company (SIC) |
| Mr. Emmanuel Coleman de graft | Deputy managing director (SIC) |
| Mr. Gideon Agbemabiese | Director, National Investment Bank (NIB) |
| Mr. Kofi Kportuphy | Coordinator, National Disaster Management Organisation (NADMO) |
| Mr. Kwesi Ahwoi | Chief executive officer, Ghana investment promotion council |
| Mad. Magdalene Apenteng, | Debt management officer, Ministry of Finance |

## "Technicized" Termination of Appointments

Again, there have been reports in Ghana where people's appointments and promotions have been stalled for several years and even junior officers have by-passed senior officers to become superiors simply because the latter are not in the good books of the political leadership. There have been instances where people have been asked to proceed on leave without sufficient cogent reasons or adhering to laid down principles (Quartey 2007). He explains "the trend started under the First Republic when Dr. Eustace Akwei, the first Ghanaian Director of Medical Services was dismissed by Dr. Nkrumah on some flimsy charges which were not even properly investigated. Under the Second Republic, as many as 568 public servants were dismissed at a go" (ibid, p. 24). With the case of the second Republic, popularly known as "Apollo 568," one of the victims dismissed [E.K Sallah] took the matter to Court to challenge legality of the dismissal and won the case. Still, the Prime Minister [Busia] appeared headstrong by declaring that no court could enforce any decision that sought to compel the government to employ anyone it does not want to work with. This is known in Ghana's political history as "no court," "no court" syndrome.

The arbitrary dismissal of civil and public servants without just cause has continued in the Fourth Republic. A careful analysis reveals that the two major political parties in Ghana the National Democratic Congress (NDC) and the New Patriotic Party (NPP) appear guilty of dismissals and removal from office of civil and public servants without just cause (see Tables 1 and 2). It is important to note that in most cases, those who are dismissed are perceived not to be in the good books the governing party of the day, whether perceived or real. Such dismissals have implications on commitment level of hardworking public administrators, in terms of the loyalty and dedication required of public administrators who may harbor the feeling of being likely

**Bureaucracy and Politicians Agenda: Examining Politics-Administration Relationship in Ghana, Table 2** Some public servants dismissed by President JE Atta-Mills under the NDC Government

| Name of Public/ Civil Servant | Position of Public/Civil Servant |
|---|---|
| Professor ken Attafuah | Chief executive officer, National Identification Authority |
| Mr. Robert Ahomkah-Lindsay | Chief executive officer, Ghana investment promotion council (GIPC) |
| Dr. grace Bediako | Government statistician, Ghana statistical service (GSS) |
| Mr. Opoku Manu Asare | First deputy statistician, Ghana statistical service |
| Nana Obiri-Boahen | The National Service Secretariat (NSS) |
| DCOP Douglas Akrofi-Asiedu | Coordinator of National Disaster Management Organisation (NADMO) |
| Mr. Antwi-Boasiakoh | Ashanti regional director of NADMO |
| Owura Kwaku Sarfo | Managing director, Volta River authority |
| Mr. Martin Mireku, | Executive director of the Ghana tourist board (GTB) |
| Mr. Ras Boateng | National Health Insurance Authority (NHIA) |
| Mr. John Dekyem Attafuah | Chief executive officer, National Petroleum Authority (NPA) |
| Mr. prince Ernest Oduro- Mensah | Chief executive officer, National Sports Council |
| Madam Elizabeth Adjei | First woman director of Ghana immigration service (GIS) |
| Prof. Kwabena Frimpong–Boateng | A renowned cardiothoracic surgeon, and the chief executive officer, who established the National Cardiothoracic Center at the Korle Bu teaching hospital, and director of the center was just given a dismissal letter with immediate effect from the then minister of health |
| 30 civil servants | These were from the Ministry of Foreign Affairs who had officially received their appointment letters and had been duly sworn into office as A5 foreign service officers were sacked |
| Nii A. Barnor | Acting director of information services department |

to suffer the same fate in the near future (https://www.modernghana.com/news/348136/1/cardio-doctors-call-off-strike-after-president-mil.html).

At best, it tends to leave the resultant workforce with political intimidation, where public administrators are in fear that their future could be in jeopardy unless they succumb to whims [sometimes unpleasant to national interest] of their political bosses (Peters and Pierre 2004).

What appears paradoxical is that Article 191(a,b) of the 1992 Constitution seeks to protect civil and public servants against any wanton dismissal. It states "a member of the public services shall not be victimized or discriminated against for having discharged his duties faithfully in accordance with this Constitution; or dismissed or removed from office or reduced in rank or otherwise punished without just cause." In spite of this provision, politicians have their own "mafia" way or using some technicalities to actually circumvent around this constitutional provision. This is what we term as *technicized termination of appointment.* This was disclosed in our interaction with key respondents selected for the study. They explained how politicians demonstrate their dislike for particular civil servants. An interviewee from the Ministry of Employment and Labor Relations explained that:

> They try to find faults, monitor closely [perhaps set you up] and post you elsewhere when they feel or find you as a threat. They make it look like the rules and regulations apply to only one particular person and you will get frustrated.

The respondent provided a practical instance of how politicians tend to terminate appointments of civil servants or at best making them redundant. He continued:

> Some retired, some resigned and others proceeded on leave... There was once an incident where a worker was asked to choose from two options. The worker was to either resign or be sacked from the position he occupied.... in some cases the politician will not really be concerned about competence.

This point above was forcefully brought home by a key interviewee from the Ministry of Gender, Children and Social Protection who explained emotionally that:

> Oh hmmm, this one they demonstrate it by transferring or posting you elsewhere or sidelining you. What they do is that you will be there but they won't engage your services. They make you redundant and use your subordinate. They use abusive

> language for example, they say things like "a simple letter or report you can't draft.

Another interviewee from same context provided a practicality and technicalities involved in such process:

> . . . The Head of Civil Service (HOCS) and the members are in bed. The HOCS [head of civil service] doesn't dishonor the application of the Ministers and other politicians. There are a lot of cases that is best known to them. The Minister may not transfer an employee himself but has the power to do that through the HOCS.

The revelations above confirm a study by Quartey (2007, p. 22) which observes that politicians "have sought to determine who works under them, contrary to the provisions of Act 327 and the principles of the Service [politically neutral and unbiased institution managed by the Head of the Civil Service]."

### Special/Personal Assistants "Syndrome"

A complex dimension making the neutrality of the civil service a mirage is the surreptitious introduction of "special/personal assistants" into the civil service of Ghana. Under this system, some Ministers appoint their own "special assistants" to perform functions which hitherto were performed by career bureaucrats. This system is gradually gaining grounds with the potential of being entrenched in the administrative system. Such "special assistants" are normally appointed by the government of the day. As such their loyalty rests with the government of the day and not with subsequent governments. They tend to be more powerful than their Chief Directors as their authority and power are derived from the Presidency. This system can be seen as an extension of the patronage system, where party loyalists are rewarded with public sector positions. This situation negatively affects the meritocracy and impartiality principle espoused by the civil service and ultimately the efficiency of the public service in general.

In an interview with an official, he explained the prevalence and effect of the Special Assistant syndrome:

> It affects competence, demotivates and breaks continuity of service. It promotes bootlicking and eye service. Normally what they do are political in nature and so these special assistants run political errands for the Ministers. . . Redundancy of the deputy Minister, Chief Director and other Directors. It is even sometimes embarrassing when these youngsters (special assistants) are used to do Ministry work and the Deputy and the Chief Director are sidelined.

Another participant explained the principle behind that initiative and the challenges it posed: He posited:

> The special assistants' syndrome is a brilliant idea since it helps the civil servant to maintain his or her A-political stance. However, institutional memory is sometimes lost when the political head and the special assistants vacate the scene. Secondly, it leads to duplication of roles and subsequently bloats the wage bill.

This was given support by a respondent from the Ministry of Gender, Children, and Social Protection Ministry that:

> It is a sword cutting at both ends. I think the rationale behind it is good but was not applied prudently. Special assistant is supposed to be a personal aide to the Minister or the deputy Minister. The civil servant is all too careful or cautious to be involved with the politician. . . . This situation affects professionalism in the sense of responses to the issues centering on the Ministries. . .It also means they unnecessarily bloat the wage bill and the state losses. There is double salaries for an activity that can be done by one person.

### Appearance of Impropriety

Public administration is largely driven by rules, *albeit*, decisions are to be guided not only by rules but also ethics and quest for effectiveness. Public leadership "must look right, smell right and feel right and must avoid appearance of impropriety", and this creates a positive image for oneself and the public service. However, in the Ghanaian case, some practices may make this a fiasco. A typical example has been the appointment of a contextually novice (Anita De Souza not qualified for NADMO job – Kofi Portuphy asserts%C2%A0_%C2%A0Sankofa Online.htm) to head the

Commission on Human Rights and Administrative Justice (CHRAJ). In spite of the concerns raised at the time of her appointment, the President paid deaf ears (http://citifmonline.com/2014/09/17/lauretta-not-qualified-for-chraj-job-gyimah-boadi/), until she displayed her incompetence and unprofessionalism that the presidency had no option than to fire her (http://edition.myjoyonline.com/pages/news/201204/85477.php; http://citifmonline.com/2015/11/04/mahama-fires-chraj-boss-lauretta-lamptey/) in 2015. What makes her appointment at the time questionable was that the President concurrently made her a board member of the Ghana Commercial Bank contrary to Article 222 of the 1992 Constitution which prohibits a Commissioner of CHRAJ from occupying any other public office. Although the legality was debated, in short, there was an appearance of impropriety which creates a bizarre image for public service delivery and the public administration system. Public administrators are "guarantors of public trust" (cited in Farazmand 2002) and should avoid any appearance of impropriety.

In another instance, there have been reports of people engaged in active partisan politics and at the same time high profile public administrators. A typical example in recent times had been the National Coordinator of the National Disaster Management Organization (NADMO) who also became the chairman of the ruling NDC party, yet his public position was not revoked at the initial phase. Holding the Chairmanship of a political party and serving as a Coordinator of such an important public organization appears to constitute a violation of the 1992 Constitution and an appearance of impropriety and does not cast a good image of public administration. In that same organization, the deputy chairperson was also the ruling party's national women's organizer.

The neutrality of the public service becomes compromised if public administrators are seen to be explicitly engaged in partisan politics. Ayee (2013) enumerates a list of these by positing that:

> Some high profile public administrators who had engaged in partisan politics include the Chief Director of the Ministry of Finance; Director, Ministry of Mines and Energy; Director-General, National Development Planning Commission (NDPC); Chief Executive, Korle-Bu Teaching Hospital; Executive Secretary, Revenue Agencies Governing Board; Chief Executive, Driver and Vehicle Licensing Authority; Executive Secretary, Food and Drugs Board; Deputy Governor, Bank of Ghana; and Chief Director, Ministry of Health. (p. 446)

Perhaps, these officials would want to prove their loyalty to the appointing authority or to demonstrate their eligibility for appointment, reappointment, or promotion. This is because such criterion [loyalty] is what politicians seem to recognize and consider most. With the discussion so far, the political environment in which civil and public servants operate makes the demand for neutrality and competence a difficult enterprise. There are complex web of factors which come into play making the neutrality expectation both in theory and practice a myth. Balancing values appear difficult for public personnel managers and political elites. In all the ministries, at the apex is a political boss who is directly accountable to the government or president and so has a role or influence in virtually all appointments, promotions, transfers, and possible dismissals. This tends to make civil servants and public administrators in general, very vulnerable to the political elites, and therefore affects the neutrality in their decisions and actions. Consequently, irrespective of one's competence, dedication to work, seniority, and integrity, one may still not be able to achieve his ambition in the civil service if he is not in the good books of the political leadership in power.

## Conclusion

In the search for competent bureaucracies and a synergistic politics-administration continuum, what has been the main dilemmas in the relationship between politicians and bureaucrats; and how does politics operate to usurp the professional bureaucratic tendencies of the civil and public service? What is the implication of flawed

personnel processes in the operations of the civil service? And what should the civil servants do to adapt to their situations and positions?

This article sought to undertake a critical assessment of the Politic-Administrative Relationship from a developing administrative context [Ghana]. The study contributes to existing knowledge on politics-administration relationship and machinations of politicians vis-à-vis the public bureaucracy of developing administrative systems.

Firstly, although civil servants and public administrators are required to discharge their responsibilities in a fair manner, the political context within which they operate, together with other subtle political machinations by the political leadership tend to usurp the professional competence of public administrators. In their quest to "capture" the rank and file of the public service, appointment on merit in most cases has been sacrificed for political patronage and rent-seeking. There are situations where competence has been sacrificed for perceived loyalty. To politicians, the definition of "loyalty" means more than patriotism to the state to connote being sympathetic to the political party, "praise-singing" and even sycophancy which one demonstrates by either explicitly defending or chastising one political in the news media. This conclusion corroborates an observation that in spite of the administrative and public sector reforms in many developing countries, one could still observe traces of "increasing politicization" where "personal loyalty to political figures and party in power has become the most important virtue of civil servant which even overrides the loyalty of prospective official to the state" (Wijeweera 1989). It is common to recognize that political influences tend to affect selection of public servants which lead to the latter dancing to the tune of the former. In this case, politicians may have succeeded in "capturing" the public service for expediency, but a key question to ask is to what extent does this contribute to "jeopardizing bureaucratic integrity?" (Peters and Pierre 2004).

Secondly, from the data gathered and discussion above, this study adds to the literature that civil and public servants routinely are faced with ethical dilemma, a *neutral/professionalism-loyalty/succumbing* imperative. The neutral competence connotes responsiveness, efficiency, social equity in the recruitment and performance of public work. The quest for *loyalty/succumbing* and politicization tends to weaken or polarize the formidability of public administration. This is because those officials who may not want to succumb to the whims of politicians incur the wrath of their political bosses or get transferred to a deplorable context or have their promotions either delayed or asked to proceed on leave.

Thirdly, by way of appearing to legitimize their "mafia" actions, politicians mostly hide "behind the scenes" and influence [or direct] the legitimate bodies [offices, departments, and agencies] to perform this task in a well-designed manner to avoid series of legal implications. Getting competent public servants sacked for trivial or no reason through some *technicization* [with political undertones] especially when there is change of government has implication for the long-term productivity and strategic human resource planning. There is the need for institutional strengthening; development of the ethical tendencies and loyalty of civil servants and more importantly the role of civil society in acting as external checks and critiquing operations of politicians as well as civil servants and their interactions should be promoted (see Yeboah-Assiamah 2016).

Finally, for civil servants to cope with the competing imperatives, they need to balance between legality and code of ethics/profession and act effectively. This means that in spite of the competing or conflicting interests that tend to influence their decisions and choices, there is a need to protect or defend the law at all times. Again, the appointment of civil servants must be based on merit and where there is a need for representative democracy; such criteria should be a complement to the meritocratic principle. The two should not be seen as mutually exclusive or substitutory values but rather complementary. The study contends that irrespective of what instrumental reasons politicians want to achieve, merit criteria

should not be sacrificed for patronage, this is because there is a statistically significant relationship between meritocracy and public service delivery or productivity (Evans and Rauch, 1999). Elements of knowledge, skills, abilities, credentials, track records, and experience should be seen as constant aside other criteria. This point has also been advanced by Olowu (2002) who explains that those administrative systems that make merit considerations a priority are in most cases well equipped to progress in terms of management reforms. This has implication for development management since the civil service and public administration in general is quite phenomenal in the overall execution of public sector productivity.

# Bureaucracy and Politicians Relations

Muhammad Sayadur Rahman
Department of Public Administration,
Jahangirnagar University, Dhaka, Bangladesh

## Synonyms

Bureaucracy and democracy; Political control of bureaucracy; Politicization of bureaucracy; Politics, power, and bureaucracy; Politics-administration dichotomy

## Definition

Bureaucracy: Bureaucracy is a system of official rules or state apparatus that plays a vital role in policy formulation, implementation, and delivering public services to the citizens.
Politicians: Politicians are the actors or players of power game, and the persons those who are professionally involved in politics, and elected by the people and hold an elected office in the system of government.
Relations: The relations can be defined as the process and manner of power relationships among the actors of governance. It refers to the mode of interaction between politicians and bureaucrats.

## Introduction

Politicians and bureaucrats, these two actors are always inseparable and indispensable to each other. It may even be argued that from ancient civilization to the present globalized age, they have been at the heart of the governance and development (Farazmand 2009). Thus, the relationship between politics and administration has been recognized as a classical problem in political science and public administration, and it is a fascinating issue at any level of government (Svara 2006a). At the same time, the relation between politicians and bureaucrats has always been a central issue of governance, and it "has been a subject of extensive research" in the literature of politics and administration (Demir et al. 2015: 79). However, this relationship has not always been without apprehension. Therefore, scholars have attempted to explore the patterns of relations from different perspectives. Keeping in mind the above overall contextual background, this paper focuses on vexing to fathom the nature of the relationship between politicians and bureaucrats theoretically. It aims to figure out the theoretical perspectives of politicians and bureaucrats' relationships from the existing literature. At the same time, it tries to explore some overall underpinning variables which underpin the relationship between politicians and bureaucrats in any political systems.

## Bureaucracy and Politicians Relations: Theoretical and Conceptual Notes

From the theoretical perspectives, the academic discussions on politics-bureaucracy relations are extremely asymmetrical and diversified. Notwithstanding the theoretical divergence of perceptions and interpretation, this paper intends to organize a theoretical and analytical framework for understanding the politics-bureaucracy relations by combining classical, new classical, and contemporary views on politics-bureaucracy relations. A plenty of theoretical literature and empirical research findings proliferate demonstrating a strong relationship between the politicians and bureaucrats in the theoretical perspective. But there is no absolute single approach or paradigm of studying politics-bureaucracy relations. Maybe the reasons are differentiable legal-institutional arrangements in the contextual factors, as well as the elitist group (politicians and bureaucrats) behavior is not same in everywhere, although there are some common characteristics. Nonetheless, the question that is very much enduring is that how are they related to each other in an institutional structure? And how do these two actors interact? Thus, the nature of relationships between politicians and bureaucrats is a key issue

to explore and conceptualize. In this respect, classical thinkers have conceptualized the relationship providing a sharp division between political and administrative spheres in the conceptual foundation of politics-bureaucracy relations, which suggested a dichotomy approach in the roles and relationships of politicians and bureaucrats.

On the other hand, many new classical and NPA writers have argued from the theoretical point of view that in the performance of governance role, a clear-cut division or separation between politicians and bureaucrats is neither possible nor wise, while several empirical studies have yielded mixed results and tried to intermesh between the above two models with some variational modeling in explaining politics-bureaucracy relations. Similarly, many NPM and post-NPM writers have emphasized on the model of autonomy and complementarity.

Therefore, the debate on theoretical approach or perspective can be kept apart in the following four theoretical perspectives that have been developed over the centuries on the politics-bureaucracy relations. From the existing literature on politics-bureaucracy relations particularly combining the theoretical normative works and empirical research, the following theoretical paradigms or perspectives can be identified: (1) the classical "politics-administration dichotomy" approach, (2) the "mutual-interactive" approach, (3) the New Public Management and "return to dichotomy/autonomy" approach, and (4) the emerging "reconceptualization of dichotomy, complementarity, and political responsiveness" approach. Each paradigm identifies a set of explanatory factors, which also lenses the theoretical and conceptual framework. These theoretical understanding lend the land of comparative context.

## Politics-Bureaucracy Relations in a Comparative Context

The historical and comparative analyses from different countries suggest that the patterns of political and bureaucratic power relations are varied on the basis of political systems and different institutional practice. In general, politicians and bureaucrats play distinctive roles in policy-making process in western democracies. Cross-national variation is observable for many other reasons, including constitutional provisions, development sequences, nature of politicization, and party systems (Aberbach et al. 1981). In general, American bureaucrats are much more politicized ideologically, and they play more political role than the European bureaucrats, and the bureaucracy is more powerful in the United States, but they are structurally subordinate to politics and are not autonomous as is the United Kingdom and other European countries. However, bureaucracy in developing or postcolonial countries has not been developed following a natural process. Rather it is developed by the colonial power for their administrative support, and after independence of these countries, political leadership used this bureaucracy as state mechanism (Potter 1986; Carino 2001). Thus, politics-bureaucracy relations in developing countries are yet to shape in a certain character, and still it is under construction by following different notes and suggestions, though they have a long experience of the administrative state.

Consequently, we observe the paradigm shifts of the theoretical perspectives on politics-bureaucracy relations. Interestingly, scholars are frequently searching for proper paradigm using more theoretical or argumentative method along with less empirical inquiry. But the empirical evidence that underpins the narrative is by its very nature different understandings of politics-bureaucracy relations. In general, we find major two paradigms of relations: dichotomy and mutuality in western democracies. On the other hand, relations in developing countries did not shape in a certain character, and still it is under construction by following different theoretical models, notes, and suggestions. Another notable thing is that throughout the last two centuries, the process of bureaucratization in the administration has been significantly speeded up, and now bureaucracy has become a dominant institution indeed. Once upon a time, the western scholars embraced the bureaucratic domination in the development administration, and now, they are in doubt

whether the rational type of bureaucracy is advisable for or striking a balance between politics and administration. This question reminds us to explore what factors or variables underpin the politico-bureaucratic relationships in the process of governance.

## Bureaucracy and Politicians: The Relationship Underpinning Variables

Which factors underpin the relationships between politicians and bureaucrats? To this question, it is seemed that some systemic or organizational as well as some contextual variables or components shape or underpin the interaction pattern between politicians and bureaucrats in any system of governance. These underpinning variables are shown in Fig. 1.

## The Systemic or Organizational Factors

### Recruitment, Training, and Motivation

Recruitment, training, and motivations are very important functions for any political and administrative or organizational system. This is the first and for most comprehensive obligation for organizational entity according to the organization theory. To make proper policy decisions and implementation of that policy effectively, every organization applies their best modus operandi to recruit, train, and motivate their employees for organizational efficiency. However, if we apply these three concepts to the elected politicians and official bureaucrats, then we can find out mammoth differences between them in the context of recruitment, training, and motivation. In the context of recruitment, training, and motivation the empirical data suggests that politicians are involved in politics willingly and motivated by their respective political party ideology and to maximize their self-interest. On the other hand, bureaucrats are appointed in their service position recruited by the central government by the competitive public examination, and they are deployed to deliver the services to the people at any level of government. This distinctive nature of recruitment, training, and motivation influences their roles and relations.

### Politico-Administrative Culture and Values

Politico-bureaucratic culture has special importance to the configuration of the relationships among them. The concept of culture has become a tool in the study of organizations/institutions in the last several decades which include attitudes, beliefs, values, norms, symbols, rituals, and ceremonies. Politico-administrative culture refers to dominant norms and values that shape and influence politicians and bureaucrat's attitude, interpersonal relationships, behavior, and performance in the process of governance and development (Jamil 2007). The cultural theorists argue that everything is bonded by the culture and nothing is free from culture including institutions. At the same time, politico-bureaucratic culture reflects on individual attitude, group behavior,

**Bureaucracy and Politicians Relations, Fig. 1** Underpinning variables of politics-bureaucracy relations (Source: Author)

and leadership traits. In that case, the organizational behavior and culture will be diverse according to the genetic character of the actors that are involved in the organization. Then the behavior of politicians and bureaucrats is likely to be different as it is very difficult "to find parallel forms of behavior between bureaucrats and politicians" (Aberbach et al. 1981: 31) in considering the politico-administrative culture although they are involved in the same organizational or institutional structure. So, on the basis of cultural diversity of politicians and bureaucrats, the argument can be provided that culturally bureaucrats are procedure and rule oriented as they are value neutral. On the other hand, culturally politicians are development goal oriented as they are ideological and value laden, and they want to emphasize diffusive public interest as what Almond and Verba called "subject political culture" (Almond and Verba 1963: 19).

### Legitimacy and the Style of Leadership

Legitimacy and style of leadership of the political leaders' vis-à-vis the bureaucracy shape the patterns of relationship between them. Legitimacy refers to the general acceptance of both political and administrative authority to rule. However, there is a substantial level of difference between the politicians and bureaucrats in the method of gaining legitimacy which may impact on their relations. The legitimacy of the political leaders comes from the people by the process of elections. On the other hand, bureaucrats gain their legitimacy by the legal/constitutional process of the state structure, and they are selected or appointed, not elected on the basis of technical qualifications (Weber 1958). That means it comes either through the legal structure or from the people's verdict in modern society. Secondly, another difference between them is in the question of succession. The politicians come to the ruling position because of the leader's "gift of grace" or in an established order through the election or traditional norms of inherited right, and they stay until a selective time. But the bureaucrats come to the ruling position by the selection or appearing in the competitive exam and in a manner of legal and constitutional process as agents, and they stay in administrative position until their retirement. The third difference is involved in the output of the government. The politicians are committed to perform all functions within their tenure as they emphasize reelection goals and hold interests and values, whereas bureaucrats are committed to perform selective functions by priority basis as they emphasize and are concerned with career goals, red tape, and patron-client interests and hold fact and knowledge (Aberbach et al. 1981). The fourth difference occurs in their leadership styles and traits, although there is no common argument as to what characteristics distinguish a political leader from a bureaucrat, what functions political leaders perform, and the effectiveness of their leadership styles. Nonetheless, if we consider Weberian classification of leadership traits, then politicians belong to the charismatic and traditional dominations or leaderships, while bureaucrats belong to the only rational-legal authority. On the other hand, bureaucrats always emphasize rational decision-making and hierarchical order in rational-legal structure of domination, whereas politicians in contrast emphasize customs, rituals, and hereditary process, and it patronages patrimonial and patriarchal forms of administration. These separate traits of leadership style of politicians and bureaucrats underpin the relationships between them.

### Professionalism and Specialized Knowledge

Professionalism and specialized knowledge are important underpinning variables of politics-bureaucracy relationship. Patterns of relationship in administration between politicians and bureaucrats always had been a term of query in the sense of professionalism and expertise of knowledge. Near about one century back, Weber mentioned the importance of professional politicians and professional bureaucrats. He had predicted that twentieth-century politics would be dominated by career politicians and bureaucrats but that bureaucrats, with superior knowledge and experience, would tend to dominate the politicians (Weber 1958). The theoretical arguments reveal that public policy decision needs professional and expertise knowledge. Professional knowledge and public policy decision-making are the area of

competition and combination between the politicians and bureaucrats. However, Weberian logic of political professionalization and differentiation of professional practice reveals distinctive practice between politicians and bureaucrats.

Therefore, it reveals that the nature of professionalism and its practice between politicians and bureaucrats are different. As Wilson (1989) viewed, politicians are motivated by a "reelection goal," whereas bureaucrats are motivated by a "career concern." Politicians are transitory, and bureaucrats are undying forces to serve the people of the state. Moreover, there is also a theoretical paradox in considering professionalism in bureaucracy. One view treats professionalism of bureaucracy as a threat to democracy and representative government and the other as a necessary condition for effective governance (Farazmand 1997). As a result, a sharp differentiation of professionalism between politics and bureaucracy always exists in the process where bureaucrats are more professional than the politicians in considering their policy expertise and knowledge – bureaucrats are more expert than politicians "who possess special knowledge and skills" (Demir and Nyhan 2008: 83). This segregate nature of professionalism and specialized knowledge determines the model of relationship between politicians and bureaucrats. Nonetheless, it can be said that more professional involvement in politics and administration reduces politics-administration conflict. That means more experience in politics and administration, less the conflict between them.

### Institutional Structure

What will be the apt relationship between the two actors is determined by the nature of institutional structure. Institutional structure is the most important variable among the organizational or systemic factors. What will be the roles and relations between or among the actors who are involved in the organization explicitly depend on three important principles: philosophical principle of institutional structure, nature of services, and autonomy practice. When an institution is built up following the Hierarchal-Subordination Model or the principles of classical Weberian-Wilsonian philosophy of separate duties, then theoretically, "politicians are the hierarchal leaders of the administration, as well as employers for the administrators" (Jacobsen 2001: 8) thus results the dichotomous relationship between politicians and bureaucrats. On the other hand, when the institution is built up following the philosophy of overlapping roles, then the relations are likely to be mutual. Secondly, the relations between politicians and bureaucrats depend on the nature of services provided by the particular institution. This implied that when the institution will be built up for providing "prescriptive service," then bureaucrats will dominate over the politicians. In contrast, in the case of "political machine" politicians will dominate over the bureaucracy. Bjorkman (1979) provides this kind of argument in the case of India. He finds that as Indian Civil Services and Indian local government is established for prescriptive service, thus it is dominated by the British-minded bureaucracy. Consequently, different types of roles and relationships may emerge in the interaction of local politicians and bureaucrats (Bjorkman 1979: 10–12). The third factor is autonomy practice and the degree of central control over the political institution. If the political institution can purely exercise autonomy and free from central control, then relations between elected representatives and bureaucrats are likely to be less conflicting than the central control institution. Therefore, the relations between elected politicians and bureaucrats are influenced by institutional setting.

## The Contextual Factors

### Social Background and Role Orientation

Several empirical studies show that politicians and bureaucrats belonged to two distinctive social classes, and these distinctive social characteristics are associated with distinctive role perceptions and values. They provided the argument that distinctive social background and role perceptions of politicians and bureaucrats display different interaction patterns both at the central and the local government. This different interaction patterns may influence the level of relationships.

### Policy Formulation and Implementation

An important question that is always associated with the politics-bureaucracy relation is concerning policy making and implementation. That means who makes policies and who implements are always a debatable issue in the literature of politics and administration. Although scholars have focused exclusively in response to the question providing their argument, different school of thoughts have been raised. Like the orthodox politics-administration dichotomy model, where politicians will approach the policy and bureaucrats will simply implement the policy, and their relationship will be superior-subordinate controlled by the politicians. On the other hand, another school of thought provides mutuality or partnership model and focuses on the interconnectedness between politicians and bureaucrats in the policy process, where the relationship will be mutually exclusive between politicians and bureaucrats. Notwithstanding these arguments and debate over the century, the question remains continued and challenging to the contemporary scholars and practitioners (Demir and Nyhan 2008).

Therefore, several empirical researches in the context of western and European context identified bureaucrat's leadership role in the policy-making and implementation process (Montjoy and Watson 1995; Jacobsen 2001). Aberbach et al. (1981: 24) observe that both the elected politicians and official bureaucrats are involved in the policy-making process and governance "although they differ typically in the scope of their concerns and the specialization of their knowledge," and they identified four different images in their roles and relations. Some research suggested complementarity view with acknowledging the distinct perspectives of politicians and bureaucrats (Nalbandian 1994, 2006; Svara 2001, 2006b), and some found that "political guidance had a low and nonsignificant impact on the planning ability of the public administrators" in the context of local government (Demir and Nyhan 2008: 92). Thus, the cross-national analysis shows that the characteristics and perspectives of politicians and bureaucrats vary on the basis of culture and context.

### Regime Types and Ideology

Politics-bureaucracy relation depends on the type and nature of the regime in which the two actors perform their functions. Thus, the regime type and ideology are the considerable variables in shaping politics-bureaucracy relationship in any administrative system. More explicitly, theoretically bureaucrats are "value neutral," and politicians are "value laden and ideological" in the Weberian administrative system where bureaucracy is "rational or "ideal type." But in practice, both politicians and bureaucrats are ideological as they are involved in the politics of policy making and implementation. On the other hand, the nature of the regime whether the democratic or military is in state political power is a considerable factor. If the military bureaucracies are in state power, then bureaucrats dominate over the politicians. In contrast, if the democratic regimes are in power, then bureaucracy allies with the politicians. This tendency of politics-bureaucracy relations negatively reflects when the local elected politicians and bureaucrats are both involved in the politics of policy-making process with holding different political ideology. In that case, different ideologies between elected politicians and official bureaucrats generate conflicting interest in the interest articulation and aggregation, and, thus, consensus on policy process and governance is usually difficult. This "ideological differences frequently divide them into hostile camps" (Kothari and Roy 1969: 9), and if sometimes this indirect political involvement of bureaucracy and ideological ambiguity violates the "rules of the game," then it is a threat to the whole system of governance in general and particular to the political regime.

### Politicization of Bureaucracy

The term politicization is not new as a method of political control over the bureaucracy. Many observers and thinkers of bureaucracy in developed and developing countries have noticed behavioral aberration reflecting societal culture of the developing countries and studied and that argued maintaining firm political control over the bureaucracy is essential for nation building and achieving national developmental goals for

developing nations. Notwithstanding its increased political role, the western bureaucracy still remains structurally subordinate to politics, but the political involvement of the bureaucracy in many third-world countries appears to be exceptionally high along with politicization. At the same time, most of the discussion of public administration for the past several decades has been focused on political control over the bureaucracy and administrative reform claiming that public bureaucracies are the major barriers to policy change especially on the "New Public Management" (NPM) that has emphasized the importance of effective management in controlling public programs and services. In this connection, maybe an affordable and profitable level of politicization can play a pivotal role in fostering the democratization process (Rouban 2007; Carino 2001). Therefore, politicization is a discernible fact in the discussion on politics-bureaucracy relations and their roles and responsibilities irrespective of developed and developing countries. However, the fact is that if politicization refers to such a situation where appointment, transfer, promotion, and other career decisions of bureaucrats are dependent on political biasness and the will of the political masters and bureaucrats are involved in politics for achieving such a particular aims and goals, then it creates an interaction problem between politicians and bureaucrats. Thus, the nature and gravity of politicization also determine the model of relationship between politicians and bureaucrats and process of governance and development.

### Self-Image and Mutual Interaction

The relationship between politicians and bureaucrats or between a minister and a secretary predominantly depends on mutual interaction and how they perceive each other that we may call the self-image between them. The culture of mutual interaction or trust builds up based on convention, and it takes long time. To promote institutional integrity, an environment of mutual trust and respect is necessary. Any relationship means trust, mutual respect, sharing of roles, and responsibilities with an approved manner. American spoils system, British Whitehall model, and German hybrid model of politics-bureaucracy relations are the best examples which are based on mutual trust. If the presidential selections of bureaucracy are right, trust and confidence grow automatically. Drewry and Butcher (1991) have explained the importance of mutual trust between a minister and a civil servant providing an example of a relationship between a husband and a wife in a Victorian household in the context of Whitehall model. A recent series of inquiries was conducted by the British House of Lords Constitution Committee (2010) and the House of Commons Public Administration Select Committee (2007) on the politics-bureaucracy relationships. They also emphasized the importance of mutual interaction and trust in the changing pattern of roles and relationships between minister and civil service. So, there is no doubt that mutual trust is an important underpinning variable of politics-bureaucracy relation.

## Conclusion

It is true that the realm of the politicians and that of the bureaucrats differ in many respects. However, the nature of relationship between them depends on the abovementioned variables. Thus, we indicated earlier that the systemic/organizational and contextual factors influence to shape role perceptions and relations between politicians and official bureaucrats because there is a substantial difference between politicians and bureaucrats in considering the systemic and contextual factors. Nonetheless, the theoretical understanding reveals that all variables are not equally important to shape the roles and relations between politicians and bureaucrats. From the above discussion, we can summarize the findings showing the itemed related differentiations between politicians and bureaucrats as follows: the recruitment process, training, and motivation of politicians and bureaucrats are completely different, and it matters in their relations. Similarly, politico-administrative culture is also different. Politicians are more ideological, and bureaucrats are more rule oriented, and their different cultures influence on the relationship between them. Likely, legitimacy and

style of leadership are different, and this difference impacts on their relationships. On the other hand, bureaucrats are more professional, and they hold specialized knowledge than politicians. It signifies the relationships between them. Institutional structure is a significant underpinning variable for determining the relations, as politics-bureaucracy relations depend on the nature of autonomy practice and institutional structure. Social background and role orientation are to some extent different between them. It influences the relations, and, furthermore, relationships depend on the mediating nature of role in policy formulation and implementation. Likewise, regime types and ideology are the important considerable variables of relationship. Politicization of bureaucracy is also an important underpinning variable of relationship between them which may sometimes display the negative relations between them. The relations between the elected politicians and bureaucrats mostly depend on self-image and mutual interaction between them. Therefore, it is necessary to explore the attitudinal and behavioral dimensions of their interaction to determine the prototype of relationships, and, thus, more empirical evidence is required to explore the ways in which these two set of actors view themselves, in their role perception, and interact with each other in the pursuance of governance.

## Synonyms

Conflict between bureaucrats and politicians; Politics-administration dichotomy; Politics-bureaucrats relationship: Adversaries or Partnerships?

## Definition

Bureaucracy and politicians is a concept that refers to the theoretical relationship between bureaucrats and politicians in the affairs of the state. While defining politicians and bureaucrats, Wilson (1887: 210) stated that "politics is state activity in this great and universal, while administration, on the other hand, is the activity of the state in individual and small things." According to Wilson, "politics is thus the special province of the statesman, administration of the technical officials. Policy does nothing without the aid of administration, but administration is not therefore politics" (Wilson 1887: 209–210). Thus, this concept is used to provide a clarification about the role of bureaucrats and politicians in the administration of the state.

## Introduction

Elected politicians and appointed bureaucrats are two important actors in the modern government. Considering the importance of their existence in the policy process, the issue has drawn considerable attention of the academicians and practitioners. Politicians are seen as sovereign representatives of political values and interests while the bureaucrats are seen as the subordinate policy executors whose major concern is efficiency. The most important aspect of this issue is the politics-administration dichotomy that requires attention as a clear separation between political and administrative responsibilities is sine-qua-non for the successful formulation and implementation of the policies. The tussle between the politicians and bureaucrats has been in discussion for centuries. Max Weber advocated in favor of a "Neutral Competent" bureaucracy and a clear distinction between politics and administration (Weber 1947). This idea was modified by Woodrow Wilson in his classic essay "The Study of Administration" who advocated for adopting the separation principle in order to safeguard bureaucrats from partisan influence. This notion of their relationship was termed as "Complementarity" model of politics and administration by Svara (1999). The advocates of this approach were mostly in favor of exerting absolute political control of the bureaucrats in a representative democracy. Here, politicians were conceived responsible for policy making while bureaucrat's role were perceived as the executors of policies framed by the politicians (Farazmand 1997). Thus, it is very difficult to make a clear demarcation among their power and authority due to the simplistic nature of the doctrine which is difficult to hold up in practice. It has come out from the findings of different studies (Svara 2001) that the relationship between these groups is very complex and differentiated. As a matter of fact, making a separation between politics and bureaucracy is very difficult as these are two sides of a coin. Cooperation of both parties is required for their existence as power is very important for the politicians, and once they obtain power they require a legal entity to exercise that power. This write-up intends to explain the dynamics of politics-bureaucrats relationship, identifying challenges they face and suggesting appropriate mechanisms of overcoming those problems.

## Dynamics

The dynamics of politics-bureaucrats relationship can well be discussed through the agency theory. First, there is a strong hierarchy between the elected politicians and nonelected bureaucrats. Most importantly, bureaucrats are compelled to serve the democratic principles as they are bound by legal contract where it is clearly mentioned that their main responsibility is to implement the law faithfully. Second, over the period of time, the interests of politicians and bureaucrats have been separated. From time to time, priorities of political coalitions get changed as compared to initially adopted policies. Likewise, interests of the bureaucrats have been separated due to the influence of institutionalization and external politics. Third, there is a tendency among the politicians that they opt to change policy implementation. On the other hand, bureaucrats often try to resist external demands as they have different interests (Wood and Waterman 1991). Now, an important question is that whether it is really possible for the politicians to control bureaucracy. According to agency theory, political control is possible on the ground that bureaucracies are created by the elected institutions who design the structure in such a way that it facilitates their control on it. Politicians always remain vigilant on the activities of the bureaucrats in order to make sure that information is not distorted. Moreover, activities of bureaucrats are subject to sanctions and rewards if they fail to attain the desired result.

Another dynamics is the traditional view of neutrality in politics-administration relations which has been challenged on many grounds. For instance, the scope of policy making has been extended beyond the political executives. The reality is that the bureaucrats are required to play an important role in the policy process in addition to their perceived role as the policy implementers. The dynamics of coalition politics have attributed to the decline of bureaucratic neutrality as the ministers in coalition mostly remain busy in playing the power game, allowing the bureaucrats to play an upper hand role in the policy process.

Another major dynamics in the politics-administration relationship is the impact of politicization. This can be described from two broad perspectives. In the first category, politicization has been considered as the participation of the bureaucracy in the policy decision-making process, while the second category deals with the impact of politicization of the appointments in the bureaucracy. The first category is derived from the earlier politics-administrative dichotomy which was one of the founding theories of public administration. According to this model, bureaucrat's role was considered to be the implementation of all policy decisions enacted by the politics as part of their role as a policy maker. Once this process has been politicized, civil servants get involved in the process of taking policy decisions, adopting them, and provide explanation that are usually the responsibility of the political leadership (Rouban 2007). The advantage of the dichotomy model can be described from two perspectives. The first one is that the foundation of public administration has been strong due to the application of this mode. Secondly, partisan intrusion within the bureaucracy has been obstructed (O'Toole 1987). However, in the course of time, it has been found difficult in making a separation between the making and implementation of public policies which is the basis of dichotomy model. Thus, this model has been considered as myth than a reality.

Another important dynamics of politicians and bureaucrats is that, in most cases, this relationship has been considered in the decision-making level by the majority of the scholars. Only a few scholars like Nicholson-Crotty (2009) and Peters and Pierre (2001) have stressed the importance of considering this issue from the perspective of politics-management realm, particularly in the developing countries. The essence of considering this relationship between public management lies in a number of reasons. These are: (i) In a situation where the interests of politics and bureaucrats collide with each other, this relationship determines the success or failure of implementation of institutional (administrative) reforms; (ii) Institutional strengthening and achievement of successful development goals depend to a

large extent on the pattern of their relationship; (iii) Improvement of public sector efficiency as well as the functioning of the modern democratic state depends on this state of their relationship; and (iv) Their support is necessary in order to build citizen's trust in government and improve perception on the performance of entire government machinery (Vigoda-Gadot and Mizrahi 2008).

Another dynamics of this relationship has been described by Carino (1991) through four models. The first one is "a regime-dominant model" that speaks in favor of high political control over the public service. The second mode "bureaucratic co-primacy" that refers to the fact that democracy is dominated by the bureaucrats as they have expertise, permanence, and institutionalization. The third model which is an authoritarian regime suggests that bureaucrats find very little room to maneuver. That is why, they remain subordinate. And "an authoritarian and bureaucratic co-primacy" is the fourth model that suggests that since bureaucrats assume less explicitly subordinate roles they remain very close to an authoritarian leadership. To be more specific, this model indicates a rule of the state by a combination of military and civilian bureaucracy. Analyzing these four models, Carino came up with some observation about the dynamics of politicians-bureaucrats relationship. These are: (i) Commitment to democracy plays an important role in determining the government's mode of interaction and attitude towards bureaucracy; (ii) Regime changes force the bureaucracy to fall into a vulnerable position; and (iii) Level of institutionalization helps bureaucrats to overcome from their vulnerable situation.

Most importantly, institutional arrangement in the form of formal and informal rules governing the extent of democratic government practices affects the behavior of the public officials in most cases. Thus, public officials experience both the opportunities and constraints of varying political system when they carry out their responsibilities (Kwon and Tang 1998). In addition to this, institutional arrangement also affects the policy-making and administrative operation of democratic government (Ostrom 1991). Thus, it can be said that institutions play an important role in shaping and defining the politicians and bureaucrats relationship. To be more specific, it is the nature of bureaucracy and the extent of democratization that actually determine politics-administration relations which determines the extent of the success of any working organization.

## Challenges

Politics-bureaucrats relation suffers from a number of challenges. The first is the impact of politicization on the bureaucracy. It refers to a situation where the political masters play the most influential role in the decisions relating to the appointment, transfer, promotion, and other career decisions of civil servants. The application of this principle has two dimensions in different country contexts. In the developed country context, the practice of appointing party loyal at the key strategic positions is quite usual as it allows the executive branch to exercise some means of control over policy decisions. On the other hand, in the developing country context, political control is used as a means of exploiting the bureaucrats in order to serve the interest of the politicians.

Considering the importance of democracy and taking into consideration the vast array of policy issues that are placed before the government, the complexity of these issues, and the resources required to address these issues, elected politicians do not have any alternative than to delegate some of their responsibility to the bureaucracies. Thus, politicians lose control over those issues that are delegated to the bureaucracies. In this type of situation, bureaucrats find them over burden as well as empowered that could motivate them to serve their vested interest first instead of the interest of the politicians. The political nature of bureaucracy gets highlighted due to the tension between the necessity of delegation and the potential problems associated with it. However, different political actors, including legislators and courts, presidents and governors, prime ministers and cabinet ministers, and interest groups try to manage this tension. Thus, the relationship

between these two groups needs to be discussed from the lens of political analysis (Huber and Shipan 2011).

## Conclusion

The issue "politics-administration" relationship has gained importance in the literature of New Public Management (NPM) as well as this concept has stressed emphasis on the reshaping of the relations among politicians, administrators, markets, and citizens (Box 1999). However, one of the important factors that have mounted the tensions between politicians and civil servants is the increasing role of the administrators in the political process and increasing involvement of politicians in the policy implementation process (Svara 2001). In order to redress such tensions, emphasis has been given on the separation of political and administrative functions instead of integrating them by the economic ideology of the NPM. It was suggested with the expectation that a clear separation of power would lead them to understand that they have different functions to perform – that the goals should be set by the politicians while these goals should be implemented by the administrators according to the directions of the politics.

Finally, it can be stated that the above mentioned challenges could be overcome through the application of complementary model which is based on the premise that elected officials, and administrators should work jointly in the common interest of the state that would ensure sound governance as well. In this model, emphasis has been given to the fact that although both groups should have distinct roles, there should be interdependency among these groups that would bring compliance with independence. In addition, administrators should have respect for political control, and they should have a commitment to shape and implement policy in such a manner that serves the public interest. They should be able to express their differences to elected incumbents as well as they should be respectful of the law and provide support that ensures fair electoral competition. This means that the administrators should appreciate the politicians and the politicians should be supportive of professional standards. Most importantly, in order to overcome the dichotomy – whether public administrators are "instrumental or supportive" – they should follow the standard dichotomy versus non-dichotomy options. They should consider them as the instruments and contributors to the political process which is instrumental and constitutive (Heady 1984).

## Definition

Bureaucracy — The term appeared in France in the first half of the seventeenth century. It derives from the combination of the French word *bureau*, meaning "office," and the Greek term *κράτος*, which means "power." It denotes the supremacy of rules in the conducting of administrative functions. The new word entered the social sciences with Max Weber, for whom the bureaucracy was the typical administrative apparatus of legal power (Weber 1922).

Public administration — A public sector, nonprofit organization institutionally designated to carry out public functions and subject to the direct or indirect political guidelines of elective bodies. Public organizations often have bureaucratic characteristics but may also display non-bureaucratic organizational features.

Politics — Any activity concerning the acquisition, organization, distribution, exercising, reproduction, and transmission of political power is politics. Power is political when its decisions are imposed with cogent force on society as a whole. According to Sartori (1987, 214–215), "Collectivized decisions are, instead, decisions that apply to, and are enforced on, a collectivity regardless of whether they are taken by the one, the few, or the many. The defining criterion no longer is who makes the decisions, but their scope: Whoever does the deciding, *decides for all*. The notion of collectivized decisions permits, to begin with, the assertion that *politics consists of collectivized decisions*."

## Introduction

Administrative apparatuses have existed throughout history, even in remote ages such as the Egyptian and Assyrian-Babylonian civilizations. Although they were very different, the Latin and Byzantine civilizations had administrative structures, as did the ancient Chinese empire. An

excellent example of administrative organization is the bureaucracy of the Persian empire, founded by Cyrus the Great and expanded by his successors Cambyses and Darius, members of the Achaemenid dynasty. Lasting from 559 to 330 BC, when it was defeated by Alexander the Great, the Persian empire encompassed many peoples with different languages, cultures, religions, and type of social organization and economy. The empire was renowned for its ability to administer vast territories covering over 3 million square kilometers from the Western shores of Asia Minor to the Caucasus, the border with India and the Nile valley – no political structure had ever been so imposing. The Persian monarchs were not just great conquerors but also magnanimous and tolerant rulers (Farazmand 2001).

The Persian empire was unrivalled during the Achaemenid dynasty; Rome, which would later become a comparable imperial power in terms of territorial size and capacity to govern, had not yet made an impact in the ancient world. Founded in 753 BC, by the second century BC, Rome had become the largest Mediterranean power, and it continued to expand in the following centuries in the West and the East. In order to control of vast expanses of territory, the administrative solution was the "province," an administrative district outside Italy, the inhabitants of which were considered foreign subjects. In the imperial age – which ran from the first to the fifth century AD – they were granted Roman citizenship. The imperial was marked, at least until the second century AD, by a period of intense urbanization. Hundreds of colonies were established throughout the empire, which had Roman-style institutions and the right to self-government; they were also free to adopt local laws and customs (Kelly 2004). In the East, relations between Rome and the Parthians became difficult around 50 BC. The Parthian empire (Arsacid dynasty: 246 BC–AD 224) bordered with Roman territory along the upper reaches of the Euphrates, and the two empires were often at war: the Parthians wanted to conquer the rich eastern provinces of the Roman empire, while the Romans craved direct access to the Persian Gulf. The Parthians were the only people who could seriously compete with the Roman armies. But a series of Parthian defeats undermined the Arsacid dynasty, which fell as the result of a revolt in AD 224 and was replaced by the new Persian dynasty of the Sassanians (AD 224–651), descended from the Achaemenid line. It would be Rome's eastern adversary until the seventh century. The Persian and Byzantine empires became locked in a permanent war until the seventh century, so protracted that both sides underestimated the emergence of a third power in the Middle East. The expansion of Islamic power from the seventh century onward would be rapid and uncontainable: the Arabs conquered Persia definitively in 651, and vast territories were clawed away from the Byzantines. As they lacked administrative experience, the Arabs allowed expert Byzantine or Persian officials to remain in their posts in the conquered territories. The Western Roman empire gradually crumbled in the face of barbarian attacks (Huns, Visigoths, Vandals) and ended (conventionally) in 476. After 476, the Romano-Germanic kingdoms formed in the Western territories. The Germans, who were totally lacking in administrative experience, perpetuated the administrative structures built up by the Romans, which provided stability to the new dominion (Veyne 1997).

As this quick historic overview indicates, the Persian and Roman administrations are good examples of organizational systems designed to perform civil and military functions (Farazmand 2001). At the same time, the long and tormented process leading to the formation of the modern state, which would begin in Western Europe at the end of the Middle Ages, requires us to focus on the evolutionary path of politics (Poggi 1978). It involved a gradual process of differentiation and specialization, which would be reflected in the origins and development of a "modern" conception of the administrative function and of administrations. Political power became "secular," increasingly separate from social structures and from religion, and finally evolved into the rule of law. The public administrative function would emerge following a process of political modernization and the establishment of modern political institutions. The separation between politics and

administration would be a central aspect of the process of modernization of political power.

The relationship between politics and administration in democratic systems is a key theme in political studies. There are two fundamental reasons for this. First of all, public administrations, unlike private ones, make mandatory decisions, which are valid *erga omnes*, whatever the preferences of the individual citizen. They are coactive in nature, endowed with cogent force (Lowi 1964; Sartori 1987). Secondly, bureaucrats not only implement the law but contribute to producing it. In fact, a large proportion of legislation, after being passed by the deliberative bodies of the political system, requires further elaboration. Very often, the law simply establishes the general principles of a measure, leaving it up to the bureaucracy to produce second-level regulations designed to specify and flesh out content neglected by general and abstract dispositions. Moreover, if such decision-making power was not delegated to the administrative actors engaged in implementation processes, they would lack a resource that is often indispensable for resolving challenges posed by uncertainty. In fact, unpredicted events crop up as a matter of course when implementing public policies, and a discretionary approach is required when addressing them. That said, mention should also be made of the critical element of administrative action, namely, the lack of any form of democratic legitimation to exercise political authority (Page 1985).

Weber (1922) observes that the bureaucratic organization selects bureaucrats on the basis of their competence, and therefore there is no direct link between administrative action and the democratic-representative circuit. Consequently, the normative theory of democracy prescribes that public administrations should be subordinate to the representative political institutions, assigning to the latter some fundamental powers of control. The constitutive principles of democracies entail that political leaders are able to affirm their authority in the sphere of administrative institutions. It follows that in the absence of political guidance bureaucratic systems would not necessarily be bad, inefficient, or arbitrary instruments of government, but they would certainly be systems lacking public control (Page 1985).

Without political supervision, the bureaucracy might be induced to pursue its own interests, rather than performing the tasks with which it is charged. It is for this reason that one of the most complex problems is to create and maintain a responsible bureaucracy capable of responding effectively to political guidelines. The problem can never be definitively solved, only mitigated and kept under control by a set of counterbalancing structures and influences (Almond and Powell 1978).

## The Question of "Who" Makes Decisions

According to the normative theory of democracy, mandatory decisions are the responsibility of the elected, those who, through the democratic process, are legitimated to exercise political authority. Through the mechanisms of political responsibility, they are also held to account for their choices by the people. At the same time, bureaucratic subjects are tasked with actuating those very same political decisions, on the basis of the legitimacy deriving from their technical and professional competence. So in the realm of public choice, two different mechanisms justify the exercising of political authority: the first, which is political, emanates from democratic investiture, while the second, administrative one hinges on juridical and professional competence.

The constitutional and institutional arrangements of the relationship between politics and bureaucracy stem from these principles of the democratic political tradition.

### Analytic Perspectives and Empirical Dynamics of the Relationship Between Politics and Bureaucracy

These premises formed the basis for the separation between politics and administration that became established in the theory of bureaucracy from the second half of the nineteenth century onward, both in Europe and the United States (Weber 1922; Wilson 1887). The neutrality and impartiality of administrative action are key elements of that theory. According to the first principle, the bureaucracy must execute any political command

received from the legitimate holders of political power, whatever the political colors of the elected representatives. The second principle prescribes that the bureaucracy must carry out its tasks *sine ira ac studio* (Weber 1922), without any bias for or against the measures to be taken, and responding exclusively to technical considerations.

Historically, the modernization of central administrative apparatuses – which accompanied the development of the nation-state – was marked, in Europe, by a dissociation between politics and administration, with the development of a system of relations founded on the *hierarchic subordination* of bureaucrats to politics. It was based on the hierarchy between the political role and the bureaucratic role and follows Weberian theory, in that it established a rigid separation of the contributions of the types of actors. The roles were oriented toward two different functions: the discretional one was assigned to the political role, which dealt with the merit of government choices, while the procedural function was attributed to the bureaucrat, who applied, according to the rules, the decisions made by the politician and dealt with the method. From this perspective, the role of the bureaucrat was basically to execute orders.

The division originated in the Napoleonic age and became consolidated in the course of the nineteenth century, the historic period in which its maximum potential unfolded. However, this pattern gradually became looser and diversified. Many studies have documented a tendency toward convergence and integration between political and bureaucratic roles. Ultimately there tends to be a de facto convergence between the decision-making powers of politicians and top-level administrators. Empirical investigation of top-tier decision-makers reveals more elastic, complex, and mutually interchangeable relational systems than the clear-cut normative dichotomy.

Comparative research conducted by Aberbach et al. (1981) in seven Western democracies revealed at least four different models of relations between politics and administration. The first image corresponds to the "theory of separation": the role of bureaucrats is simply to implement decisions taken by politicians. The second image evokes the formulation of Simon (1947) and the separation of value judgments and factual judgments, present in every decision. It delineates the "theory of the distinction of facts/values" and acknowledges the bureaucrat's contribution to policy making. However, this contribution is limited to the factual and empirical sphere, while the definition of which values to pursue remains the preserve of elected politicians. The third image is that of "counterbalancing interests and competences": it describes the politician who, in making choices, looks to represent interests, while the bureaucrat takes part in decisional activity by attending to the balance of different competing and coexisting needs in public choices. Finally, in the fourth image, called the "pure hybrid," the two roles coincide and are interchangeable in policy making activities.

In order to classify the broad spectrum of relationships between political and administrative authority, Peters (1987) also described various typical-ideal setups, proposing five different models. The first one, the "formal model," expresses the theory of separation and of the predominance of politics, the analytic features of which have already been illustrated. It has played, and continues to play, an important role at a normative level, in that it embodies a fundamental principle of the Western political tradition. The second one, called the "village life model," is based on consensual cooperation by both elites. They are distinguished by considerable horizontal integration and sociopolitical homogeneity, with the actors sharing the same goals and agreeing on the methods of public action. The third proposed arrangement is the "functional model," grounded in consensual cooperation between both elites, as in the previous case, but in a specific policy sector. Here there is a vertical integration of elites, which develops along functional lines according to spheres of policy. The fourth model, called the "adversarial model," describes competitive and conflictual relations between elites: politicians and bureaucrats compete as adversaries in order to gain control over policy making. Finally, the "administrative model" outlines a relationship characterized by the dominance of the bureaucracy in the decision-making process. This

model hinges on the importance of technical competence, which enables the administration to perform a crucial role in policy making. In this relationship, politicians ratify or check technical proposals made by bureaucrats. The relationship in the administrative model is essentially overturned with respect to Peter's "formal model."

The principle of separation was normatively reformulated during the last decades of the twentieth century by the doctrine of New Public Management (NPM), rooted in the theory of public choice. This doctrine presented an alternative scheme to that of hierarchic subordination. According to this perspective, the relationship between politicians and administrators should be inspired by entrepreneurial principles. It follows that in the public policy sector there needs to be a division of roles based no longer just on legitimacy but on performance. The *system of contractual relations* envisages an exchange between two services. One is the political service and involves identifying the strategies and final goals of government action and evaluating results. Conversely, the management service consists of achieving the goals by choosing the means, overseeing their actuation, and accounting for the results. The administrative manager exercises discretion at the operational level. Corresponding to the exercise of decision-making power are different types of responsibility. Political responsibility (policy responsiveness) is the ability to formulate public policy guidelines correlated with the electoral programs and mandates. Management responsibility (accountability) is understood as the capacity to turn those plans into operational projects and give them concrete substance. The responsibility of the manager consists of being able to account for outcomes with respect to the contracted tasks. The integration between the two types of responsibility takes place through a contract, a program, and an agreement: as the person commissioning/acquiring public policies, the politician has the task of identifying the goals and evaluating the results; as the producer/supplier of public policies, the manager has the task of formulating strategies to turn input into output, to supervise implementation, and to record outcomes. Such a design reaffirms the separation between the guideline tasks of the executive body and the management tasks of the management body. The model pursues the intent of limiting opportunities for the bureaucracy to bend public policy choices to satisfy its own corporate interests but also for politics to collude with pressure groups to the detriment of the general interest.

In contrast to separation, an opposite way of regulating the relations between top-level decision-makers is the one based on the *fusion* of political and management roles, the historic example of which is the *spoils system*. By this term is meant a relationship between roles founded on a bond of trust between the politician and the bureaucratic manager, whereby the latter is co-opted by the former. The peculiarity of this decision-making arrangement is the sharing of the sense of direction regarding what decisions are to be taken, to the point that it becomes homogenous. Managers are appointed directly by politicians and remain in office for the period of the electoral mandate, though the appointment may be revoked in the course of the mandate. Two distinct elements result from this arrangement. The first is that the separation between politics and administration is apparent, in that the politician delegates part of their power to the manager, who is not impartial but an operative appendage of the politician: this enables the latter to supervise the process of actuation as well. Secondly, the administrative management is characterized by a high turnover, so one cannot say there is an independent class of public managers. The historic and geographic locus of this system of relations was the United States in the nineteenth century. The method was devised by President Jackson in the wake of his election victory in 1829. Its application to the federal apparatus enabled him to replace a body of amateur volunteers with a body of competent professionals chosen by the president from within his party. It involved an exchange between the loyalty received by the newly elect president during the election campaign and the conferral of public offices to his supporters by way of reward. The system came to an end in 1883, when a law known as the Pendleton Act introduced the merit system into

the United States as well. The transition to the new system was not immediate, nor definitive: a body of functionaries is still nominated directly by the federal president today, the heirs of the spoils system, who coexist with a body of professionals recruited on the basis of merit (Heclo 1984).

It should be observed, finally, that the evermore widespread and pervasive application of the principles of NPM has had the effect of reviving the practice of the political appointment of administrative chiefs in all the Western democracies (Peters and Pierre 2004). In fact, the clear-cut separation of tasks and responsibilities between political chiefs and bureaucratic chiefs, together with the delegating of significant amounts of decision-making autonomy to administrative managers, has prompted the politicization of management posts. If, on the one hand, the model is designed to give – also through a loosening of the hierarchic principle – full autonomy/operational responsibility to the administrative management, on the other hand, it is possible to observe a greater degree of discretion being exercised in the choice of who should occupy top-level posts.

### Political Control of the Bureaucracy

The trend toward a relationship based on trust is one means whereby executive political bodies can exercise control over the bureaucracy. It is accompanied by instruments present at a legislative level, whether procedural or structural. The former includes highly structured legislation that leaves little scope for exercising administrative discretion; stringent financial instruments; performance measures; periodic, in-depth activity reports; and hearings to gather information. One very effective structural instrument is the choice by the head of the legislative body to assign particular responsibilities to different administrations (Krause 2010). The above are all mechanisms by which political organs can control administrations. Alongside them, within any political system, it is also possible to find specific instruments that envisage and guarantee bureaucratic accountability. These have been classified as judicial, evaluative, informative, and participatory tools (Peters 1978). Judicial instruments are those whereby citizens can turn to the judicial system – whether in the form of special or ordinary courts – to seek a ruling on measures passed by the administration. Evaluative instruments are designed to ascertain institutional and individual performance with respect to preestablished policy goals. As regards the informative tools, periodic reports on the work and performance of offices are prescribed by all policies of transparency, with the purpose of subjecting the actions of administrations to public scrutiny. Finally, besides the transparency of administrative acts and access to data pertaining to administrative choices, a further aspect should be considered: this relates to the publicizing of the administrative process and public participation. One essential modality, in this respect, is that of public hearings, envisaged in a considerable number of areas at the level of local and state administration, before public action gets under way.

Naturally, the instruments for controlling the bureaucracy and the modes of expression of administrative responsibility, though present in all Western countries, especially in the age of NPM, vary considerably according to the political systems and the type of public function given to administrations.

## Bureaucratic Politics: Resources and Interactions Between Politicians and Bureaucrats

The relationship between politics and administration is a complex one, then, which is influenced by many factors and shaped by differing circumstances. As is evident, normative models outline unequivocal and constant modes of interaction. However, in the decision-making process, the relationship between politicians and bureaucrats is marked by a number of complex and changing patterns of behavior. It is affected in particular by the participation of other public and/or private actors in political processes and by the multiple interactions that arise as a result. In order to account for this multiform and shifting reality, the concept of *bureaucratic politics* was developed (Allison 1971). This concept denotes an

analytic perspective according to which the relations between politicians and bureaucrats are oriented toward reciprocal negotiation and toward the search for integration between political roles and administrative roles. The bureaucratic politics approach stresses that the relationship between politics and administration is unlikely to lead to separation or to the supremacy of one category over another. Instead, the tendency toward integration between top-level decision-makers (political and administrative) may display a variable degree of cooperation and collaboration or, vice versa, of competition and conflict.

From this perspective, in the ambit of the policy making process, several crucial resources are available to representative institutions to channel the behavior of bureaucratic actors in the desired direction. Their main resource is the *legitimacy to exercise political power*. The measures introduced by bureaucracies derive legal justification from the formal power conferred on them by the institutions of the representative government, so they can perform the duties with which they have been tasked. Political power is granted to elected politicians alone. Another important resource available to the political class is the so-called *power of the purse*. The assignation of financial resources and the definition of the rules governing how they can be spent are crucial processes for the survival of administrative bodies and their capacity to take action. Equally important is the *legal power to determine the responsibilities* of different administrations and their margins of autonomy and, more generally, to establish the ways in which bureaucracies can behave in formal terms (Peters 1978).

But bureaucrats have very significant resources as well, including technical competence, stability, the principle of political impartiality, and the strength of sector-based ideologies, together with strategic ties with interest groups (Peters 1978). In truth, the centrality of the monopoly of knowledge and of *technical competence* in the relationship between bureaucrats and politicians had already been stressed by Weber. Possession of such a resource tilts the balance of the relationship in favor of the administration, in that its contribution is indispensable for the achievement of any objective politicians wish to pursue. A second element of strength is *permanence of incumbency*: administrators generally remain in their posts for longer than politicians. On the one hand, this ensures a necessary degree of institutional continuity but on the other sets up a situation where politicians are dependent on administrators for the institutional information they hold. The bureaucracy also derives a significant advantage from the application of the principle of *political neutrality*. Their extraneousness to party politics gives administrators the image of being "experts" serving the public interest and gives their choices the guise of impartiality. From this perspective, bureaucratic decisions only have to answer to the criteria of the laws governing bureaucratic action and to the technical and professional expertise that led to the recruitment of the bureaucrat in the administrative institution. According to the principle of neutrality, it is precisely the detachment of the administrative role from the dynamics of having to seek electoral consensus that makes bureaucratic decisions impartial. The capacity of administrations to generate and consolidate *sectorial ideologies* is also an important element in the relationship between the administrative organ and political institutions. These ideologies take the form of doctrines, justifications, or rationalizations designed to support and give legitimacy to the bureaucratic program of action in a specific branch of government policy making. Equally important, in the ambit of relations with political organs, are the dealings the bureaucracy has with *interest groups* active in the same sector in which the administrative body also operates. Thanks to these ties, they are able to mobilize the support of social actors. This is particularly useful when it comes to requesting funds or decision-making autonomy from the political body and to receiving information about the sphere and recipients of their action. In many cases, policies are formulated and implemented through negotiation between administrative agencies and organized interest groups. The relations between the administrative institution and private subjects representing specific interests, affected from time to time by individual measures, range from consultation during the policy formulation stage to active involvement in the implementation phase and even the delegation of public functions to

them. Reasons of mutual convenience encourage exchange and dialogue between bureaucracies and interest groups. Peters (1978) singles out four different types of relationship: legitimate interactions, *clientela* relations, *parentela* relations, and illegitimate processes. Legitimate interactions are allowed, when they are not incentivized. In many sectors of intervention, institutional actors seek the collaboration of private actors, both in devising measures and in implementing them. Such collaboration brings the economic or social interest group directly within the circuit of production of public administration. *Clientela* and *parentela* relations – explored by La Palombara (1964) – are exclusive, privileged relations between the bureaucratic organ and an interest group. In the first case, the relationship is direct, and based on the administration's view that a particular group is the natural representative of a given area of public policy, and that it is therefore destined to express all the interests of that sector. In the second case, the relationship is indirect, mediated by the intervention of a government party, which secures privileged access to the administrative body for the interest group. In both cases, the risk is that the administration will be "snared" by the group (without/with party mediation). Illegitimate relations indicate a difficult or controversial interaction between bureaucracies and groups. In some cases, this is due to the particular inclination of the political system, which might deny access to some groups; in others, it stems from the nature of the action of private subjects, considered to be illegitimate bearers of social inputs, especially when this involves resorting to forms of pressure based on heterodox or violent protest.

Ultimately, the degree of influence of the bureaucracy on political decisions can vary significantly, depending on the resources deployed in dealings with political elites. However, the weight of the characteristics of policy issues should not be underestimated. Conditioning factors here are the degree of politicization of the question under discussion and likewise its degree of technical complexity. In the first case, high politicization would seem to correspond to a diminishing of the political role of bureaucracies. In the second case, if the issue involved is very technical in nature, the influence of the bureaucratic actor would be more widely felt. A third factor that needs to be considered is the cultural and structural characteristics of administrations: the more bureaucracies are culturally integrated and cohesive, and effectively structured, the more they will be able to perform a significant role in policy making.

On the other hand, the relationship between politics and administration and the political role of bureaucracies in public decision-making may vary according to the political/institutional system, rules and regulatory frameworks, the administrative tradition, and the role that this ascribes to the bureaucracy. The importance of the political-institutional context in which political and bureaucratic actors are operating was recently reaffirmed by the results of comparative research conducted by Page (2012). Structural constraints channel and regulate relations between actors, to the point that "The idea that bureaucrats use their position to shape policy as they wish away from the gaze, if not control, of politicians finds no supporting evidence. In fact a range of general procedures, bureaucratic norms, and institutional arrangements specific to individual systems ensure that politicians have a chance to intervene in even the tiniest issues of public policy should they wish" (Page 2012, 175).

Finally, two further external factors have a specific bearing on the relationship between politicians and administrators and on the question of the political control of the bureaucracy: the type of party system and the characteristics of the parties in government. Many research findings demonstrate that the stability of governments and their internal cohesion favor political control over the bureaucracy. At the same time, weak political leadership is often associated with weak or relatively uninfluential bureaucracies (Suleiman 1974).

## Conclusion

Political institutions and bureaucratic institutions plan and develop their actions according to a different logic and different constitutive and organizational principles. The choices of political representatives are inspired by ideals, interests,

values, beliefs, and world views that attempt to be coherent with those held by electors and, more generally, citizens. Conversely, the choices and behaviors of bureaucratic actors are inspired by coherence criteria relating to juridical norms and professional competence and ethics. Precisely due to the division of the top tier of decision-making, in democratic public institutions government, action is the fruit both of political and administrative considerations. Clearly, the phenomenon is of crucial importance, both because institutionally speaking it is very widespread and also because of its consequences. One of these is the unconquerable tension between democracy and bureaucracy, evidenced by Weber (1922) and mentioned in the introduction. It should also be observed that the issue of the shaping and control of bureaucratic institutions exploded with the shift toward mass politics and the full development of the welfare state, which took place in the second half of the twentieth century. In the face of increasing complexity, the proliferation of actors, and the themes addressed in decision-making arenas, bureaucracies were called upon to intervene and deliver complex, highly structured services. The performance of those tasks was accompanied by the delegation of decisional power by political organs (legislative assemblies and political leaders of administrations) to bureaucratic apparatuses. The process of political delegation necessarily posed the need for bureaucratic accountability and mechanisms, whereby administrations could exercise political control. Such pressures for change have grown over the last four decades, also due to the spread of reforms inspired by NPM. Without doubt, bureaucracies, at the service of democratic political institutions, have been called upon – and will be increasingly in the future – to find solutions to the great problems of globalization and of demographic, migratory, environmental, and technological changes.

# Bureaucracy and Professionalism

Adam G. Hughes
University of Virginia, Charlottesville, VA, USA

## Synonyms

Bureaucratic innovation; Professions; Service provision

## Definition

Profession: an occupation in which individual members abide by a set of best practices developed by all members.

## Introduction: The Professional Bureaucracy

In 1968, Frederick Mosher observed that "For better or worse—or for better *and* worse—much of our government is now in the hands of professionals" (Mosher 1968, 132, cited in Teodoro 2011, 11). While professional organizations are well known in legal, medical, and scientific fields, they also serve an important role in bureaucratic organization, policymaking, and service delivery. Professional organizations establish shared standards and norms that members adhere to (Abbott 1988). They help policy innovations diffuse across agencies (Brehm and Gates 1997; Teodoro 2011; Wilson 1989). They also help develop public legitimacy and encourage public demand for services (Brint 1994). Since most agency heads in American bureaucracy at both the local and federal level are in fact career professionals (Green 1989), understanding the role of professional organizations is crucial for explaining when and why service delivery is effective.

Individual professionals are motivated not only by their superiors within an agency, but also by an outside reference group of fellow practitioners. This outside group includes other specialists who agree upon a group-defined set of best practices for conduct. Professions are open to only those who meet specified criteria for membership. Once standards are defined, individuals may join or leave professions according to their alignment with those criteria. In practice, professional associations work together to define best practices for individual members of the profession, inform group members of those practices, and limit group membership to those who agree to abide by fixed rules. Thus, the act of joining a professional organization standardizes bureaucratic behavior with respect to an outside reference group.

When agency heads join a profession, they are socialized to accept its norms, even when those norms conflict with an agency's existing standard operating procedure (Brehm and Gates 1997; Lipsky 1980; Mosher 1968). For some agencies, the difference between existing practices and professional guidelines might be small; for others, professionalism offers a dramatic challenge to the status quo. In both cases, the particular constraints and incentives that shape the behavior of professional bureaucrats originate from both inside and outside of their agency. However, this shift in organizational authority imposes both costs and benefits on agencies. While a larger degree of professional autonomy can improve service delivery, there is no guarantee that individual bureaucrats will subscribe to professional norms or that those norms coincide with an agency's existing objectives. If either of these disconnects occurs, increased professional autonomy has the potential to exacerbate problems in service delivery.

## Professions as Institutions

Both bureaucratic agencies and professional organizations are institutions: they constrain human behavior in predictable ways. Bureaucracies

define tasks for agents to execute and punish those who fail to complete them. Similarly, professional organizations define how tasks ought to be executed and exclude those who defy those expectations. But when bureaucratic agents join professional organizations that extend beyond the agency, the selection of tasks and the ways that those tasks are executed depend more on professional standards than on the agency's unique experiences and written directives.

James Wilson's (1989) example of the relatively more professional Forest Service and the less professional Park Service illustrates the distinction. While members of the Forest Service often held advanced degrees, conducted research, and applied practices endorsed by the Society of American Foresters, agents of the Park Service were less educated, less focused on research, and less innovative (63–65). However, professionalism can also exert costs: as members of the Forest Service joined a diverse array of different professional associations, the agency was less able to articulate and execute a shared mission. This failure made it more difficult for the Forest Service to sustain organizational cohesion.

The fact that most public agencies involve a blend of bureaucratic and professional modes of organization is uncontroversial (Clarke and Newman 1997). In most conceptions of bureaucratic organization, street-level agents complete standardized tasks, while supervisors aim to ensure that those tasks are completed (Lipsky 1980; Mintzberg 1983). Of course, administrators cannot perfectly monitor their agents, who enjoy varying degrees of autonomy and discretion. Professionalism, as a system of incentives outside of the worker-supervisor dyad, often aims to shape agent behavior by granting more autonomy to agents. When agents think of themselves as professionals, they ought to abide by professional standards even in the absence of direct supervision.

Adherence to professional standards that originate outside of an agency raises the prospect of conflict between individual agents exercising professional autonomy and their superiors' exercise of hierarchical authority (Engle 1970). Professional agents require autonomy in order to act in concert with the standards and guidelines developed by other practitioners. Yet the standards agents wish to abide by might conflict with those that their supervisors prefer. At the same time, agents are not equally likely to internalize professional norms. While some might exercise professional autonomy in ways that improve service delivery, others might prefer to shirk from their responsibilities, ultimately decreasing an agency's ability to deliver services effectively. However, it is important to note existing research that suggests many street-level bureaucrats are in fact "principled agents" who prefer to complete the tasks assigned to them, even in the absence of direct supervision (Brehm and Gates 1997). Modest increases in professional autonomy are unlikely to undermine agency performance in most cases.

## Costs and Benefits of Professionalism

Bureaucratic professionalism promises two central benefits at the agency level: facilitating the diffusion of procedural- and policy-related innovations and increasing alignment between supervisor and agent preferences. It accomplishes the first of these by socializing supervisors and executives, encouraging them to adopt shared standards for agency behavior and implement best practices. It accomplishes the latter by socializing street-level agents, so that they consider themselves part of a larger community of practitioners. However, professionalism also has the potential to increase oversight costs and initiate conflict between agency directives and professional objectives.

Professions help policy innovations diffuse among members by providing a centralized clearing house for best practices (Abbot 1988). Only members of a profession have direct access to the accumulated knowledge of all participating practitioners. This kind of access leads to entrepreneurial policy leadership: adopting important and effective new policies by relying upon accumulated evidence from the professional reference group. But being a professional also entails greater autonomy and professional discretion at the agent level. This commitment may cause

conflict with the hierarchical structure of bureaucratic organization and have unexpected negative impacts on service delivery.

As an example of this tradeoff, consider recent efforts to increase the professionalism of police agencies. Thousands of state and local law enforcement agencies seek professional accreditation from the Commission on Accreditation for Law Enforcement Agencies (CALEA), a group created with the input of several preexisting professional associations. The process of accreditation is meant to professionalize agencies by providing a list of best practices that all agencies are required to abide by (Teodoro and Hughes 2012). These standards shape service delivery by encouraging agencies to engage in community-oriented policing and encourage diversity in hiring, among other widely endorsed professional norms. These standards originate from the professional organization and might conflict with the priorities of administrators in individual departments. If such conflicts occur, the hierarchical organization of local police agencies faces an external threat: individual officers who align themselves with the professional organization might prefer to adopt those standards, rather than those that originate within the agency.

At the same time, it is important to note that police officers enjoy broad discretion while on the job. Thus, the professionalizing influence of CALEA accreditation has the potential to improve service delivery when the costs of hierarchical supervision are highest. Research has found that professional accreditation does in fact lead officers to assert a common "sense of mission" (Wilson 1989), but that it has no effect on officer's willingness to report engaging in professional conduct (Hughes and Teodoro 2013). In other words, professionalism can build support for external standards without actually increasing agents' willingness to act upon them.

As this example makes clear, the costs and benefits of bureaucratic professionalism depend upon several factors. First, the alignment between agency leadership and professional leadership determines the success of bureaucratic professionalism. If agency heads desire outcomes that are completely at odds with professional norms, their subordinates may defect toward the professional authority. Second, bureaucratic agents may or may not "buy in" to professional norms. In cases where agents already enjoy a high level of autonomy and discretion, professionalism offers the most benefits. By aligning agents' preferences with those of an external reference group, bureaucratic professionalism could lead agents to develop their own self-monitoring capacities and ultimately encourage especially effective service delivery. But if agents do not abide by professional norms, the increased autonomy associated with professionalism could increase shirking.

## Conclusions

The professionalization of bureaucratic agencies has the potential to improve service delivery, increase the adoption of effective policy innovations, build common knowledge, and resolve oversight problems when agents enjoy broad discretion. But of course, the success of any professionalization initiative also depends upon the degree to which street-level agents observe professional norms. If individual bureaucrats do not subscribe to the best practices established by a larger group of practitioners, the benefits of professionalism will not accrue to an agency. While the leaders of most American bureaucracies are already professionalized, the degree to which those leaders endorse and apply professional norms varies dramatically. The willingness of subordinates to accept those norms varies even more.

Bureaucratic professionalism involves an implicit delegation of power: from local agency heads to the centralized authority of a professional organization. This exchange is often beneficial: adopting tried and true best practices should improve agency efficiency and service delivery. But it might also be the case that widely accepted policies and norms are ill-suited to addressing local challenges. At the same time, variation in bureaucrats' willingness to adopt professional policies means that professions will never be a one-size-fits-all approach to governance. Some agency heads resolve the delegation dilemma

posed above by selectively applying norms. Indeed, understanding why some agency leaders seek to enforce professional standards – even when those norms are contrary to local interests – requires examining individual-level factors, including personal ambition (Teodoro 2011).

American bureaucracies are already professionalized. But the degree to which individual agencies actually act in professional ways varies, and the costs and benefits of professionalization are similarly diffuse. Individual agency heads must determine whether they prefer to act in line with their elected *principals*, or if they instead ought to follow professional *principles* (Teodoro 2011, 9). As long as democratic governance requires both effective and responsive administrative agencies, agencies must act in line with both sources of bureaucratic constraint.

# Bureaucracy and Public Opinion

Brandy Kennedy
Department of Government and Sociology, Georgia College and State University, Milledgeville, GA, USA

## Synonyms

Citizen satisfaction with public agencies; Trust in government organizations

## Definition

Bureaucracy and public opinion refers to the individual or public views toward government agencies.

## Introduction

The state of public opinion toward bureaucracy is interesting and important not just from an academic perspective, but a pragmatic, policy perspective as well. Popular support for governing institutions is considered an important component for healthy functioning of democratic institutions (Putnam et al. 1993; Doyle 2011). In general, there is a sense that the American population has a negative attitude toward bureaucracy. For example, the term bureaucracy is commonly used in a pejorative sense, to signal organizational

inefficiency and ineffectiveness. Yet, there is some evidence to suggest the American public is generally satisfied with their personal experiences with government agencies. This essay analyzes public opinion toward bureaucracy from an academic and public discourse perspective including trends in its usage as well as potential influencing factors.

### What Is Public Opinion?

Despite use of the term "public opinion" in common discourse, the concept is actually quite complex. While the contemporary term tends to denote polling results, its history goes back far before polling developed. The earliest usage of public opinion implied a much broader concept akin to "the will of the public." Erikson and Tedin (2015) explain in the late eighteenth century the term was often used interchangeably with "common will, public spirit, and public conscience." Thus, the term was understood to mean the general feelings of the population toward public institutions and public policy. The rise of modern public polling techniques altered the substantive meaning of public opinion. In the contemporary sense, the concept has come to refer to measurable sentiments that can be quantified and systematically analyzed. This distinction illuminates an important qualification in public opinion: individual-level opinion (micro) and aggregate opinion (macro). In other words, when referencing public opinion, it may be used to indicate an individual's opinion or a general public sentiment.

### What Is Bureaucracy?

Likewise, the concept of bureaucracy is complex and has evolved over time, both from an academic perspective as well as its usage in common discourse. Max Weber is well known for his contribution to the development and scholarly understanding of bureaucracy. For Weber, bureaucracy was an ideal type organized comprised of specific structural characteristics including hierarchy, merit selection, impersonality, and standard operating procedures (Morrison 2006). Since its inception, the term has evolved to denote a variety of meanings. In common discourse, for example, bureaucracy is used to describe public organizations, large public or private organizations, the people working for public organizations, and red tape or cumbersome procedural rules.

These distinctions between various meanings of public opinion and bureaucracy become important when analyzing the state of public opinion toward bureaucracy. In addition to these definitional issues, public opinion toward bureaucracy is not steady but fluctuates. A myriad of factors influence public opinion toward bureaucracy. At the aggregate level, the historical context and the political environment can shape the public mood toward government and bureaucracy. At an individual level, a variety of demographic and ideological factors may influence one's stance toward bureaucracy.

## The Academic Context

### Bureaucratic Legitimacy

The negative connotations of American bureaucracy were, in some ways, written into the design of the system. The American bureaucracy has inherent tension with democratic theory. As a constitutional democracy, the United States constitution conspicuously fails to address bureaucracy in any specific manner. As Stillman (1999) notes, while Article I goes into great detail regarding the power of Congress, the term administration or any other terms commonly associated with public administration do not appear in the text of the document. Article II denotes the power of the executive as belonging to the president, yet all other details of this are left undefined in the constitution.

This absence of public administration within the text of the constitution, coupled with a lack of democratic accountability, calls bureaucratic legitimacy into question. The bureaucracy is not created or protected by the constitution, and voters lack the direct ability to remove its officials. The field of public administration has grappled with this issue since its inception. In particular, conversations around bureaucratic accountability and legitimacy remain prevalent in the academic literature. Public administration scholars have sought

to legitimize bureaucracy via a variety of theoretical premises (Selden 1997; Stillman 1999). For example, scholars of representative bureaucracy argue that due to its demographic composition being more reflective of the general population than other electoral institutions, the bureaucracy is accountable and responsive to the public. Despite these academic efforts, on a popular level, these problems and negative sentiments remain.

### The Historical Context in America

Some scholars argue that the negative perception and feelings toward bureaucracy are in part driven by the unique circumstances surrounding the American founding. Stillman (1999) suggests that the construction of the American bureaucratic apparatus is very different from that of most other developed democracies. Stillman elaborates, "The most striking feature of America's public administration thought at the founding of the United States was its absence" (19). Western European nations developed democracy alongside already well-developed state apparatuses. America, on the other hand, developed its democratic institutions first. Additionally, the philosophical premise of small government was a centerpiece of the American philosophy that runs counter to a well-developed bureaucracy.

The history of American bureaucracy is one in which the state apparatus was small and not well developed at the founding. It remained this way until the late nineteenth century. Rapid urbanization and industrialization fueled a growing state apparatus. Stillman (1999) likens this process to the "chinking in" or filling cracks when building a log cabin. He argues this process was not systematic or well thought out. As Stillman notes, "In the process of this chinking, the development of the American administrative state would always seem half-formed and incomplete, at least by comparison to the unified and well-developed European administrative state" (58). This particular method and timing of state growth may account for some of the negativity surrounding bureaucracy.

### Hummel vs. Goodsell Debate

The academic conversation surrounding bureaucracy is best captured by the dialogue between Charles Goodsell and Ralph Hummel. Goodsell (1994) explains that the academic treatment of bureaucracy has been critical. A range of academic fields have sustained criticism of bureaucracy including public choice economics, sociology, and political science/public administration. The main focal points of this criticism include allegations that the bureaucracy performs poorly, has too much power, and is oppressive toward citizens and employees. In his seminal piece, Hummel (1977) writes a forceful and scathing critique of bureaucracy reflecting these sentiments. This widespread critique prompted Goodsell (1994) to write his influential piece defending bureaucracy.

Hummel (1977) offers a harsh critique of bureaucracy, on nearly all dimensions. He argues that everyone has problems with bureaucracy including the citizens who attempt to receive services, management and frontline employees, as well as political officials that attempt to oversee these agencies. He contends bureaucracy undermines traditional values of human life, that bureaucracy traps and transforms human beings, and that its inevitable state is riddled with conflict. He takes this even further arguing that bureaucrats are not ordinary people but are inhuman, incapable of emotion, devoid of will, and obsessed with control and efficiency.

The premise of Goodsell's (1994) piece is to combat the negative image plaguing bureaucracy reflected in Hummel's work. In contrast, Goodsell (1994) provides evidence of well-functioning bureaucratic organizations with which the American people are generally satisfied. Goodsell (1994) argues that by and large, most of the people are satisfied with most government agencies most of the time. He contends that most government agencies work well most of the time. These two contrasting presentations of bureaucracy provide a lens through which we can analyze the intricacies of public opinion and bureaucracy in America.

## Popular and Political Discourse

Public opinion on bureaucracy is not only important from an academic standpoint, but as a common piece of popular and political discourse. In

many ways, the political discourse helps shape popular discourse on bureaucracy. Goodsell (1994) addresses a myriad of these issues in his work.

### Popular Discourse

Goodsell (1994) provides a variety of survey results indicating negative attitudes Americans hold toward bureaucratic institutions. Question wording is always a concern when interpreting polls as the specific wording of polling questions can alter the response outcomes (Erikson and Tedin 2015). Question wording appears to influence the public response to questions about bureaucracy. When asked general, abstract questions about views toward bureaucracy and government agencies/workers polls suggest that the majority of Americans feel that bureaucrats are lazy, and bureaucracies are bloated and wasteful.

However, Goodsell (1994) counters this negative evidence with a litany of more positive attitudes toward bureaucracy. Goodsell (1994) argues that when asked about specific experiences with government agencies and individuals' satisfaction with services, the majority of individuals report high levels of satisfaction with their experiences and their ability to receive services in a timely manner. Goodsell (1994) expands "...it is important to note that most such polls aim at an abstract level of generalization. The questions are usually phrased very broadly, and they almost never ask citizens about their own experiences with government...when an individualized question is asked, a quite different picture emerges" (11). When analyzing multiple surveys, Goodsell (1994) concludes:

> In short these numerous individual citizen surveys, conducted at all levels of government in just about every functional area conceivable, and over several decades back to even 1929, all yield the same essential result: Most citizens are satisfied with their personal experiences with bureaucracy most of the time.

Additionally, Goodsell (1994) compares American attitudes toward bureaucracy to citizens of other developed democracies. The results suggest that generally Americans have more positive attitudes toward government agencies and their experiences than citizens of other countries.

Goodsell (1994) identifies multiple factors that contribute to the negative attitude toward bureaucracy in America. These include the historical context, as previously discussed, as well as political discourse and media coverage. According to Goodsell (1994), the media encourages negative sentiments toward bureaucracy by focusing almost exclusively on negative aspects of the bureaucracy. He argues that the media has no incentive to cover successful activity by the bureaucracy so the popular image of bureaucracy is one that is fraught with conflict, disaster, and scandal as this increases their viewership and ratings. Further, when covering negative incidence that does occur within bureaucracy, the media rarely includes details of the situation such as extenuating circumstances or the government side of the situation.

### Political Discourse

In addition to the media's contribution toward negative views of bureaucracy, Goodsell (1994) argues that politicians use these negative outcomes to their political advantage. In other words, politicians seeking office and reelection highlight the failure of government agencies to garner support from the electorate, presenting themselves as the person who can fix these problems. In this way, politicians run for government office by running against government agencies.

Goodsell (1994) elaborates:

> Countless politicians run for office...on platforms that blame society's problems on 'the bureaucrats' and their burdensome rules, lack of entrepreneurship, wasteful extravagance, social experimentation, intervention in business, and whatever else nettles. Candidates promise that when elected they will sternly deal with the bureaucratic enemy. When, after the election, neither the bureaucrats not the problems disappear, voters conclude that the survival of the former has caused perpetuation of the latter. (12)

This phenomenon may best be captured by the Reagan era, well known for the idea that government is the problem, not the solution. While Reagan personifies this sentiment, it is certainly not limited to Republican officials and

candidates. The Clinton era, for example, was well known for its push toward privatization and deregulation, supported by the argument that private organizations are more effective and efficient operations.

## Conclusion

The concept of public opinion and bureaucracy is fascinating and complex. The state of public opinion toward bureaucracy is important for public administration theory as well as government functioning. As this essay expounds, the public holds conflicting views about bureaucracy. While, on the one hand, they are generally distrustful of government and have negative attitudes toward bureaucracies and bureaucrats in general, they typically are satisfied with the specific services they receive from government agencies. The media and political discourse shape public discourse and sentiments on this issue. The work that Hummel and Goodsell devoted to this area of study is an important contribution to this phenomenon.

## Definitions of Bureaucracy

Bureaucracy comprises the permanent part of the executive organ of government. Its hallmark is political neutrality, permanency of tenure, and professional training. It runs the administration of the state according to the policies and laws decided by the political executive; however, it plays an integral role in framing the public policies and laws. It works under the leadership, direction, and control of the Political Executive. Bureaucrats put government policy into practice and exercise significant influence over policymaking.

Harold Laski defined "Bureaucracy" as the word which is usually used for "a system of government the control of which is so completely in the hands of officials that their power jeopardizes the liberties of ordinary citizens" (Laski 1930).

Gaetano Mosca concluded that in the modern State the ruling class is necessarily the

bureaucracy; he chose the word, "bureaucratic absolutism" (Mosca 1939).

Willoughby saw the task of administrators as establishing an appropriate formal organization and insuring adequate constraints on the administrator. For Willoughby, efficient bureaucracy was a solution to the manifold problems of democratic governance (Willoughby 1919).

Max Weber considered bureaucracy from a technical point of view capable of attaining the highest degree of efficiency and is in this sense formally the most rational known means of carrying out imperative control over human beings (Weber 1946).

## Definitions of Public Policy

Policy is a road map which guides the government for the achieving the required objectives. It may be defined as a public necessity assuming significance and as far as possible, properly considered for its accomplishment. Public policy can be described as the overall framework within which government actions are undertaken to achieve public goals.

"Public policy is whatever government chooses to do or not to do" (Dye 1980).

David Easton (1965) defined the concept of public policy as the authoritative allocation of values. Here, his emphasis is on the "distributive" role of the state or government.

Lasswell (1971) on the other hand, defined Public policy as a "projected programme of goals, values and practices of the government." The emphasis here is on the "goal" orientation of the state policy.

## Introduction

The term Bureaucracy was originally considered as the perversion of democracy. It was more defined in negative connotations than positive one. However, it was Max Weber who attached positive meaning to the bureaucracy. Scholars seem divided over the significance and utility of bureaucracy, as bureaucrats are considered power usurper, aristocratic, etc. The progressive outlook considers bureaucrats as change agent, development catalyst, etc.

There was another divided opinion for politics and administration. Ever since the evolution of Public Administration as an academic discipline the politics and administration dichotomy was emphasized; however, Wilsonian dichotomy of politics and administration has been rejected long back (Wilson 1887); therefore it is an accepted argument that the test of bureaucracy is not just limited to policy implementation but also for policy framing and formulation. Bureaucrats provide the wider choices, inputs, and construct the policy framework within the ambit of constitutional and legal boundaries for implementing public policies. The decision of the political executive in regard to public policy is largely based on the inputs provided by policy makers/civil servants.

Policies are purposive courses of action formulated in response to a perceived problem. Public policies undergo a specific policy process, adopted, executed through laws, regulatory instruments, courses of government action, financing priorities, and implemented by a public authority. Individuals and groups try to influence public policy formulation through the mobilization of interest groups, advocacy, and corporate and political lobbying. Public policy provides leadership to governments over a range of activities and also creates accountability channels between the government and citizens. The policy process consists of several key aspects such as defining the problem, the identified goals, and the instruments of policy which are engaged to address the problem and accomplishing the policy objectives. Henceforth it is rightly considered that Public policy is the heart, soul, and life blood of the governments.

## Features of Bureaucracy

### Permanent Character

Civil service is a career service. The civil servants hold permanent jobs in government. They mostly

join their services during their youths and continue to work as government servants till the age of retirement.

### Hierarchical Organization

Each official is placed at a particular level of hierarchy and he has access to the privileges and authority which are available to his colevel officials. Each official is supervised by superior next in higher command and supervises the immediate below level officer in hierarchy.

### Political Neutrality

The members of the Bureaucracy are not directly involved in politics. They are prohibited through civil services conduct for not joining political parties and participating in political activities. Whichever party may come to power, the civil servants remain politically neutral and carry out their assigned roles neutrally and faithfully.

### Professional and Trained

The members of civil service are recruited through open competitive examinations. They have to possess some minimum educational qualifications for appearing in competitive examination. Before their appointments in to the service, they get specialized training. They have the knowledge, training, and domain expertise necessary for carrying out their administrative duties.

### Fixed Salaries

The Bureaucrats receives a fixed remuneration. All the civil servants belonging to a particular class of administrative hierarchy are placed in one scale of pay.

### Bound by Rules and Regulations

The Bureaucrats are required to work in accordance with the "rules proper channel," and informed-making for conducting the administrative work. Each bureaucrat is required to work only within the sphere of policies and laws.

### Bound by a Code of Conduct

The civil servants have to follow a professional code of conduct which is meant for ensuring ethical behavior. Their rights, duties, and privileges are well defined. They can be penalized for incompetence or negligence or for a violation of their conduct rules.

## Features of Public Policy

### Decision-Making

Decision-making is an integral part of policy making. Policy requires clear cut and straight forward decision-making along with bounded rationality approach while finalizing policy objectives.

### Reflects Key Guidelines

Public policy, in general, provides broad directives, rather than detailed information. Once the broad contours of policies have been decided up only then the framework is identified for translating the policy propositions into tangible realities.

### Action Oriented

Public policy making is intended to result in action to achieve the desired objective for accomplishing the mandate of public policy.

### Contemporary and Futuristic

This is one of the most important features of policy making. Policy making not only attempts to address current issues and problems but also is directed towards the future challenges. Urgent issues and pressing problems require immediate handling and for that policy could be rolled out on exigency basis. While policy priorities, objectives, constraints, and instruments are decided upon, the ever-present elements of uncertainty and suspicions surrounds nearly all policy-making exercises. Actual policy making is predisposed to formulation of policies in vague and flexible terms, in order to adjust according to emerging scenario and future uncertainties.

### Formulated by Governmental Agencies

Public policy, in for the most part, is primarily directed at governmental agencies and institutions. Public policy is also directed in partially towards private persons and nongovernmental agencies, but the final decision on policy choices, modality, objectives, instrument, and framework

is taken by the political executive supported by bureaucracy.

### Public Interest

"Public interest" is a broad term which encompasses various activities intended to achieve public welfare and good for all. Furthermore, the reflection of "public interest" influences the public policy-making process and therefore is considered as the most significant determinant of policy making.

### Optimum Utilization of Resources

Public policy making intends at achieving the policy goal through harnessing the various available resources like social, capital, human, physical, and environmental. Inappropriate assessment of resources, resource constraint, and poor utilization of resources could impose serious limitations on policy framing.

### Involvement of Various Agencies

Voters, workers, students, professional bodies, academicians, intellectuals, legislators, corporates, bureaucrats, political parties, political executives, judiciary, etc., are the various organs that participate in public policy formulation process through their inputs, aspirations, and demands and can influence the policy priorities and objectives to a great extent.

### Functions of Bureaucracy

Bureaucracy or Civil Servants play a key role in running the public administration by performing the following functions.

### Implementation of Governmental Policies and Laws

Bureaucracy plays an active role in implementing government policies and laws. Not even the best policies can yield positive outcomes if they are not properly implemented by bureaucracy.

### Policy-Formulation

Bureaucrats provide the necessary information and data which is essential for formulating Public Policy. It is the prime responsibility of political executive to frame the policy. However, without the integration of the bureaucracy in the policy-making process, policies cannot be formulated. Bureaucracy with its sere expertise, professional training, and command over the information becomes a big player in the policy-formulation process. Incorporating the practitioner's inputs into the policies within the broader framework of laws and regulations provides bureaucracy a commanding position in policy formulation.

### Managing Administration

To manage and operate the administration the administration of various departments lies with the bureaucracy. While running the administration it is imperative for the bureaucracy to ensure that the administration is carried out in the accordance with policies, rules, laws, and regulations. The Political Executives, however, perform supervisory and regulatory functions.

### Legislative Work

The bureaucrats are also involved in law-making in an indirect manner. Various bills which are submitted to legislature are drafted by civil servants.

### Revenue Collection and Financial Administration

Bureaucracy plays an important role in financial administration. They play an active role in financial planning, budget making, tax administration, etc. They collect taxes, detect evasions of taxes, and settle disputes. In all they manage the financial affairs of their country which is one of the essential components for administrative functioning.

### Data Repository

Bureaucrats keep all the government data and records in a systematic manner. Not only they collect data but also classify and analyze data of government activities. This data resource helps the civil servants for making public policies and plans. In the abundant information, it is even more essential to keep all the authentic data in the public domain as well for making transparency in the administration and ensuring accountability.

## Functions of Public Policy

### To Organize Society

Through state policies societal problems like inequality, poverty, malnutrition, injustice, etc., are dealt with, which results in maintaining peace and prosperity in society.

### To Control Conflict

Policy is used to regulate conflict in the society by formulating laws pertaining to law and order management for guiding the behavior of members of society.

### To Collect Revenue

Policies provide the provisions in regard to collection of taxes for generation of revenue.

### To Distribute and Redistribute Resources

Identification, assessment, distribution and redistribution of resources in a fair and transparent manner are one of the most significant objectives of public policy.

## Conclusion

Bureaucrats are involved in ensuring government to citizen and citizen to government connectivity, and this channel of communication and interaction attains special significance especially in the context of developing countries. The task of bureaucrats is not just limited to policy formulation and implementation but also in policy engagement. Engaging the people by adopting participatory approach in policy formulation and policy implementation is one of the fundamental aspects of modern day bureaucracy. Bureaucracy acts as a bridge between government and the people for achieving the desired objectives of the public policies. Bureaucracy identifies the problems and needs of the people and makes policies that satisfy their demands.

Policy making is a challenging task especially in the context of developing countries. The constraints lie on various fronts such as financial, legal, social, technological, environmental, political, and behavioral. The pressure groups, lobby groups, think tanks, rating agencies, global treaties are some of the most dominant factors which influence the policy making. Internal factors like demands from various groups and associations like farmers, youth, employees, traders, artisans, etc., is also a prime concern while making the policies.

Therefore it is obvious that policy making is a complex activity through which ethos of social justice, equity, and development of all are to be achieved. The bureaucrats remain under constant vigil to roll out public policies for serving the larger interest of all. Civil servants with their understanding of nuances of socioeconomic-political and administrative systems are supposed to cater the requirement of policy making in holistic perspective. Policy should stand the test of legal-judicial, regional, national, and ethical scrutiny in order to achieve the broader acceptability of the policy. It is pertinent to ensure that public policy should be drawn on the basis of participatory, democratic, and people-oriented approach.

It has also been observed that civil servants are highly class conscious. They conscientiously work to protect and further the interests of their class of civil servants. They are called the white-collar class because of their faith in their superior statuses as government officials. These tendencies need to be arrested for making the bureaucracy truly representative of public interest and committed to the task of advancing the ideology and pursuits of public welfare. Civil servants have the moral and professional responsibility to carry out their duties in the public interest. The pressure and lobby groups attempt to exert enormous influence in policy making for catering their own parochial interest; however, bureaucrats are required to act as the champion of the cause of social justice and public welfare. Civil servants being the agent of socioeconomic change hold the key to roll out public policies for achieving development of all, particularly of the impoverished, poor, voiceless, and vulnerable, sections of the society.

## Synonyms

Confidence; Corruption; Evaluation of government performance; Perceptions; Public opinion

## Definition

Political trust is an evaluative orientation of citizens toward their political system, or some part of it, based upon their normative expectations.

## Introduction

The political trust literature has expanded in recent years, mainly because declining trust in government has sparked an interest in this topic. Survey-based studies have observed diminishing levels of trust in government in countries with different political systems and cultures across the United States and Europe (Houston et al. 2016). Studies show that trust in public bureaucracy is actually higher than in other government institutions. However, the low and declining trust in public administration is assumed to be a global phenomenon (Van de Walle 2007). Policymakers often blame poor bureaucratic performance as a cause of the declining public trust. Thus, citizenry dissatisfaction with specific public services and its possible consequences on public trust warrants special attention.

Citizens experience government through interactions with "street level" bureaucrats. Therefore, government employees play an important role in shaping citizens' trust in government. Citizens and elected officials who maintain high levels of trust in public administrators will be likely to provide them with more discretionary authority and less direct oversight (Marlowe 2004). Successful governance requires public support for the implementation of policy programs (Miller and Listhaug 1990). Trust has to stay above some minimal level if public policy programs are to continue to function (Houston et al. 2016). Therefore, a lack of trust is a troubling phenomenon.

## Definition of Political Trust

Political trust is the trust that people place in political institutions or their leaders. It links ordinary citizens to the political system that is intended to represent them. Trust in government is not analogous to personal trust. Personal trust is much richer and involves a reciprocal relationship. Therefore, one should speak of confidence in government and not of trust in government. Nevertheless, scholars use both terminologies in their studies of citizen attitudes towards government. For example, Katzenstein (2000) uses the word "confidence" in defining what political trust means: political trust is "the public's confidence in representative democratic institutions, including

political parties, parliament, bureaucracies, the legal system, the police, and the armed forces" (p. 122).

Thus, political trust can be regarded as an evaluative orientation of citizens toward their political system, or some part of it, based upon their normative expectations (Hetherington 1998, p. 791). As Miller and Listhaug state, trust is "a summary judgment that the system is responsive, will do what is right, and take into account citizens' interests even in the absence of constant citizens' scrutiny" (p. 358). Blind (2007) suggests that "political trust happens when citizens appraise the government and its institutions, policy-making in general and/or the individual political leaders as promise-keeping, efficient, fair and honest" (pp. 3–4). When one says that government has lost public trust and confidence, it means that the public believes that government neither intends to take the public interests into account nor would government have the competence and capacity to act effectively even if it tried to do so.

Trust in government is thought to be generally associated with government's ability to deliver services, maintain economic growth, protect citizens, and resolve basic social issues. Some policymakers have generally referred to the performance of a specific public service as an explanation for decline of trust in government (Van de Walle 2007). Policy initiatives such as the National Performance Review in the United States and New Public Management in Europe were part of government reforms that emphasized competitive, customer-driven, and market-based solutions to perceived inefficiencies in the delivery of government services. These reforms assumed that public trust can be cultivated by improving the performance of public bureaucracy and the services it delivers.

## Importance of the Trust for Public Administration

Trust is fundamentally important for public administration because it addresses a number of central and interrelated concerns: discretion, accountability, oversight, public cooperation and compliance with laws and regulations (Marlowe 2004). Several examples from the literature emphasize these points. For instance, Murphy (2004) examines the role of trust with regard to individuals accused of tax evasion and finds that when these individuals feel poorly treated, it leads to a decrease in trust, which in turn affects their willingness to comply. This suggests that actions on the part of public administrators – as simple as acting fairly, treating others with respect, and entering into friendly consultation – engender trust. In this case, increasing levels of trust translates into greater citizen compliance. Likewise, Tyler (1998) argues that public trust increases citizens' compliance with government regulations based on the premise that trusting citizens are more likely to believe that government will treat them fairly.

Trust is also important to management for reasons other than merely securing citizen compliance. For example, Zand (1972) reveals that the introduction of increased levels of trust can dramatically affect problem solving effectiveness. In an experimental study, he finds that there are highly significant differences in the level of problem-solving effectiveness between business executives primed to expect trusting relationships with other actors in their environment as opposed to untrusting. These results suggest that trust, when properly nurtured, can positively affect problem-solving effectiveness. While this investigation did not examine trust relationships with regard to the public sector, nonetheless, its implications for public management are stark. Trust, if manifested at sufficient levels, has the capacity to break the ice between entities and thus helps to enable program implementation and facilitate effective decision making.

Trust in government may also affect the willingness of a person to enter public service. In other words, distrust of government may negatively affect the ability of government to recruit people to work in the public sector. A Pew Research Center study finds that those who distrust the federal government are less likely to believe the federal government is a good place to work, to recommend to young people to start their

careers in government, or to say they would personally prefer working for the government over business (Pew Research Center 2017).

## Public Opinion Surveys

A majority of public opinion surveys have focused on citizens' attitudes towards government, its representative institutions and leaders. In contrast, for many countries the time-series data on trust in public bureaucracy are simply unavailable. Three public opinion surveys are mostly used in studying trust in public administration: The General Social Survey, The International Social Survey Program, and the World Values Survey.

The General Social Survey (GSS) provides the most comprehensive set of data to track public confidence and trust in political institutions in the United States. Since 1972, The National Opinion Research Center (NORC) at the University of Chicago has been regularly collecting survey data on all three branches of American national government and various institutions, including public administration. In 1996, 2006, 2012, and 2016, the GSS included the question that elicits public attitudes toward public administrators: "How much do you agree or disagree with each of the following statements? Most government administrators can be trusted to do what is best for the country." A five-item ordinal response scale was provided for this question with responses ranging from "strongly disagree" to "strongly agree."

In terms of international data, the International Social Survey Program (ISSP) is one of the largest programs of cross-national research in the social sciences. ISSP was created in 1984 by four social science institutes in the United States (NORC), Australia, Great Britain, and West Germany. Currently, ISSP includes 57 member-nations. One of the ISSP's topical modules "Role of Government" includes the following question: "Please tick one box on each line to show how much you agree or disagree with each of the following statements. Most civil servants can be trusted to do what is best for the country." Respondents were presented with five response options ranging from "strongly disagree" to "strongly agree."

Another largest international social survey program is the World Values Survey (WVS). The World Values Survey examines standardized cross-cultural measures of human values and goals such as politics, economics, family values, communal identities, and civic engagement. The WVS started in 1981 as a part of the European Values Study. It is currently one of the most widely-used cross-national and time-series surveys. The WVS provides data from representative national samples of the public of almost 100 countries containing 90% of the world's population (The World Values Survey 2017). A frequently used question by researchers asks citizens about their confidence in the civil service system. Responses to the following survey question comprise the key variable of interest: "I am going to name a number of organizations. For each one, could you tell me how much confidence you have in them: The Civil service?" Response options are: "a great deal of confidence," "quite a lot of confidence," "not very much confidence" and "none at all."

## Determinants of Political Trust

Trust in public bureaucracy is a function of three distinct categories of explanatory variables: socio-cultural, socio-psychological, and attitudes towards other governmental institutions. The socio-cultural approach views public trust as "the product of social experiences and socialization" (Newton and Norris 2000, p. 60). Cultural theories of democracy suggest that trust is intergenerationally transmitted and deeply embedded in society. Erikson (1953) argues that trust is established in early infancy, mediated, in a general way, by the mother's handling of her child. Studies in psychology show that a basic disposition to trust is learned during early childhood and formative years. For example, Katz and Rotter (1969) find that about 75% of the variation in teenagers' trust levels could be explained by their parents' level of trusting attitudes toward other people. Trust is an individual property and

is associated with individual demographic features, social position, cultural identity, and personal life experience (Newton and Norris 2000). For instance, Putnam (2000) maintains that "[I]n virtually all societies 'have-nots' are less trusting than 'haves,' probably because haves are treated by others with more honesty and respect" (138). While the findings generally are mixed, the following correlates tend to be examined: sex, age, education, government employment, political ideology, and civic engagement.

The second set of correlates is based on a socio-psychological explanation. It argues that political trust is a basic aspect of personality traits. People either trust or do not trust. Erikson (1953) opines that a "basic trust" personality trait is formed during the first stage of psychological development of a child. If a child is raised in the warm and secure environment and his basic needs are met, the child's view of the world will be one of trust. Basic personality traits are enduring and they influence many aspects of people's behavior.

Social trust is the attitude toward other people and may be helpful in solving collective action problems. Across a lifetime, individuals learn to trust or distrust by experiencing how others within their society treat them and how, in turn, others react to their behavior. According to theories of interpersonal trust, attitudes toward public officials reflect a generalized trust in others (Houston 2008; Richardson et al. 2001). People who trust each other are more likely to cooperate with one another. Those who are trusting of others are less likely to worry about being treated unfairly by the political-administrative system. Interpersonal trust helps make political institutions work because it "spills over" into cooperation with people in local civic associations, and then "spills up" to create national networks that are essential if democracy is to work (Putnam 2000).

The third set of correlates explains trusting attitudes as a function of individual assessment of government performance. Contrary to cultural theories, institutional theories of democracy contend that citizen trust is the product of citizen evaluations of the economic and political performance of the government. Positive assessments of the workings of government should enhance trust towards the civil service. Individual assessment of government performance and attitudes towards government actors are used to identify the trusting personality.

A trusting attitude is a function of satisfaction with the performance of government officials and institutions. Citizens trust government because government is working for them. Citizen trust in government can be increased by improving citizens' perceptions of government performance (Marlowe 2004). "Public administrators have to be trustworthy in order to win citizens' trust, believing in local knowledge and action, listening to citizens' voices, sharing power with citizens, displaying trust and respect in the administrative process, and educating and engaging citizens" (Yang 2005, p. 283). The research shows that citizens who perceive government as performing well report higher levels of trust in public institutions (Christensen and Laegreid 2005; Marlowe 2004; Van Ryzin and Gregg 2011). For example, Christensen and Laegreid (2005) find that citizens who are satisfied with the treatment they receive from the public health, employment, and social services generally have a higher level of trust in public institutions than citizens who are not satisfied with their treatment. Furthermore, the study shows that being a consumer of specific public services is less important for people's level of trust in government than their degree of satisfaction with them.

The perceived trustworthiness of administrators also may be influenced by diffuse support for government. Trust in one political institution spills over into attitudes about other political institutions (Christensen and Laegreid 2005; Hetherington 1998). For instance, Marlowe (2004) finds that trust in public administrators is closely related to respondents' perceptions of government performance as well as their confidence in particular institutions such as Congress and the executive branch. Van de Walle (2007) finds that positive attitudes towards municipal services spillover to confidence in public servants. To the contrary, Americans' increasing dissatisfaction with Congress triggered their distrust of politicians and government in general (Hetherington 1998).

## Conclusion

Political trust is an evaluative orientation of citizens toward their political system, or some part of it, based upon their normative expectation. A minimum level of political trust is necessary for the stability of government institutions and effective implementation of public policies. Trust in political institutions and their actors enhance citizens' willingness to comply voluntarily with government laws, regulations, and policies. Citizens experience government through interactions with "street level" bureaucrats. Therefore, government employees play an important role in shaping citizens' trust in government. Citizens and elected officials who maintain high levels of trust in public administrators are likely to provide them with more discretionary authority and less direct oversight (Marlowe 2004). Successful governance requires public support for the implementation of policy programs (Miller and Listhaug 1990). Trust has to stay above some minimal level if public policy programs are to continue to function.

The deficit of trust in government has raised concern about the legitimacy of the public bureaucracy and its role in governance. Public administrators across the globe have looked to modernization efforts as a means to enhance public attitudes, with the reforms of the "new public management" gaining broad international implementation. Implicit in these reforms is the idea that public trust can be cultivated by improving the performance of the public bureaucracy and the services it delivers. In light of the New Public Management reforms, public administration scholars have turned their attention to studies of citizen attitudes towards the public service and the causes and consequences of these views.

# Bureaucracy and Revolutions in the Arab World

Imane Hijal-Moghrabi
Public Administration and Leadership Program, The University of Texas of the Permian Basin, Odessa, TX, USA

## Synonyms

Administrative apparatus; Public administration; Public offices; Public service

## Definitions

Organizations of government in the Arab world; the machinery of government in the Arab world; the executive branch of organizations of Arab states

## Introduction

Public bureaucracy is the executive arm of government. It is a means through which government policies and programs are implemented and public services are delivered. As such, bureaucracy is the locus of government action and the key institution of governance and administration. It is extremely functional to system maintenance and regime enhancement, and its military-security functions are fundamental for maintaining order and stability (Farazmand 2009).

Because bureaucracy, in its very nature, stands for stability and order, it is often slow to cope with changes (Farazmand 2009). If this is the case, then how do bureaucracies and bureaucratic structures deal with revolutionary changes? Political thinkers have addressed the relationship between public bureaucracies and revolutions from different perspectives. Some, like Karl Marx, contended that old-regime loyalists can never be trusted. For a revolution to achieve its objectives and protect its gains, all government officials of the old regime must be removed and replaced with new ones who are supportive to the new regime. Others, like Lenin, limited the removal and the purge process to key officials only (Farazmand 2009).

This essay highlights the relationship between bureaucracy and revolutions in the context of the Arab world. The Arab world is that region of the world that extends over the Middle East and North Africa and comprises 22 countries, most of which share a common history, language, religion, and culture (Jreisat 2009). Arab bureaucracies refer to governmental organizations in those countries which comprise the public sector and the civil service as well as the military-security bureaucracy which has played a significant role in the recent history of the Arab world.

The discussion begins with a brief historical background and, then, proceeds with addressing the relationship between the bureaucracy and the three waves of revolutions that have occurred in the Arab world since the mid-twentieth century. The essay concludes with a reflection on the Arab bureaucracies and the need for socioeconomic development and cultural change in the Arab world.

## Historical Background

In the late eighteenth century, the Ottoman Empire – the last of the Islamic dynasties, which ruled the Middle East for about 400 years – started to weaken and to lose its territories in North Africa. That was a time where different Western

powers were in a continuous race for armament and colonization. They turned to the Middle East to fulfill their imperial ambitions. This process started with the abortive Napoleonic attempts to occupy Egypt in the late 1700s. Afterward, the French shifted their attention to the *Maghreb* – the territories to the northwest of Egypt – thus occupying Algeria in 1830, Tunisia in 1881, and Morocco in 1883. The British and the Italians followed the lead with Great Britain establishing a British protectorate in Egypt in 1882 and occupying the Sudan in 1898 and Italy invading and occupying Libya in 1911. The rest of the Arab-speaking lands in the Middle East – namely, the Fertile Crescent and the Arabian Peninsula – remained under the Ottoman rule until the end of World War I, with the political power in the Arabian Peninsula divided among the Ottomans, the British, and a few family administrations that had managed to maintain an uneasy form of local autonomy (Owen 2012).

In North Africa, colonial powers sought to create spheres of cultural and commercial influence by attempting to replace what they saw as "the stagnant character of Muslim oriental culture" (Hudson 1977, p. 123) with modern, but alien, European values and standards. Under Western colonization, freedoms were restricted. Individual rights were abused. National cultures were suppressed. And religion became a secret practice that people were afraid to show. Foreign occupation was faced with "the passivity of a society losing control of its destiny" (Hudson 1977, p.108). The end results were a nurtured culture of fear and submissiveness, a schizophrenic identity oscillating between the East and the West, and an anti-Western sentiment that was getting stronger with every passing day under occupation. People under the Ottoman rule were not better off than their counterparts in North Africa. They, too, were suffering from a similar kind of oppression and suppression by the Ottoman Turks, awaiting the moment they become independent to establish an Arab nation. They saw in World War I an opportunity to fulfill their dream.

In 1918, World War I ended. The Ottoman Empire collapsed. But what is known today as Arab states were far from being independent, and their long-lived dream of an Arab nation was soon dissipated with the Sykes-Picot Treaty of 1916, which divided the Ottoman territories in the Levant into colonies and spheres of influence. Under the new structure, Lebanon and Syria went to France while Palestine, Transjordan, and Iraq to England under what technically was termed the League of Nations mandates. Arab countries under these mandates were promised to get their independence after they become mature enough to rule themselves. Nevertheless, "they were run more like colonies than nations-to-be" (Owen 2012, p. 13).

## Bureaucracies and Revolutions in the Arab World

### First-Wave Revolutions: The Post-Independence Era

From the remnants of the Ottoman Empire, the Europeans constructed a modern nation-state system and drew the current map of the Middle East. More interestingly, they set up new standards for legitimacy without providing the mechanism for their achievement (Hudson 1977). Colonial bureaucracies were, in turn, "rigid in character, rule bound, exploitative, elitist, and repressive" (Farazmand 2009, p. 4). Under such administrative structure, old elites were destroyed, manipulated, or replaced by a new bourgeoisie, whose interests were in line with that of colonial powers.

Anger and malaise characterized the long decades of occupation. Intentionally or unintentionally, the Arabs became politicized. Years of oppression led to a wave of revolutionary movements and independence that started in 1920s and got intensified throughout the Arab world, especially after World War II. Egypt was the first to be liberated in 1922 followed by Iraq in 1932. Lebanon and Syria got their independence in the early 1940s. Other Arab states followed the lead. By the early 1960s, all countries in the Arab world were liberated.

As a result of this revolutionary wave, the Europeans started to withdraw their troops from the Middle East and North Africa, leaving behind a fragile nation-state system, which was not only hard to govern but also fraught with uncertainty and instability (Hudson 1977). The newly independent Arab states soon were engaged in

maintaining order and stability and in restructuring their governments. Lacking political and bureaucratic experience, Arab rulers borrowed the administrative concepts and practices of their colonial masters, which were mostly legalistic, bureaucratic, and hierarchical. However, these Western administrative norms were, in reality, superimposed over existing tribal, religious, and particularistic local practices, some of which evolved over centuries of Ottoman repressive rule that left deep prints all over the institutions of the Arab world (Jreisat 2009, p. 584).

Attempting to reconcile these opposing ideals and practices prompted excessively centralized and ruler-centered administrative structures that pay due regard and loyalty to the ruler. Under such a structure, the public office became a reward to loyalists and trusted relatives. As a result, entrenched systems of patronage, cronyism, and nepotism prevailed throughout the administrative machinery. Corruption became quite rampant, and governments were characterized with apathy and with their indifference to meet the socioeconomic demands of their people.

## Second-Wave Revolutions: The 1950s and 1960s Revolutionary Coups

The fragility of the post-independence state and its inability to contain struggle and class conflict and to meet the demands of the masses opened the way to revolutionary coups from within and from above the system without the mass violence from below which is typical of mass revolutions. Thus, in the 1950s and 1960s, revolutionary coups rather than constitutional procedures were the primary mechanism of change (Lynch 2012). As a result, monarchies and absolutist regimes in Egypt, Libya, Yemen, Syria, and Iraq were overthrown and replaced with revolutionary regimes whose leaders' foremost goals were to remove all residuals of colonial influence, to curb corruption, to promote more economic and social development, and to address centuries of inequalities.

Revolutionary coups placed almost total responsibility for the planning and implementation of massive economic and social development upon the shoulders of the bureaucracy. To this end, revolutionary regimes sought to follow a path of development through central planning that incorporated policies, projects, and programs formulated by the state (Jreisat 2009, p. 583). Socialist strategies, including nationalizations of foreign companies and banks, land reforms, large-scale redistribution of wealth, expansion of education, and state-led socioeconomic development, became the fad of the 1950s and 1960s. They were pursued by most Arab leaders in an attempt to improve what they thought to be the well-being of their masses. These revolutionary military coups, directly or indirectly, affected the size, composition, processes, and behavior of Arab bureaucracies.

### Purge Movements

The first challenge faced by the 1950s and 1960s revolutionary leaders in the Arab world was to control the military and the bureaucracy by removing all residuals of the old regime, which could seriously threaten the gains of the revolution. Accordingly, old bureaucratic elites and key officers were removed, fired, or, even, put in jails. Because revolutionary leaders are often skeptical about those who served the postcolonial regimes/monarchies could also serve the revolution, one of the early art, which is common to revolutionary governments, was the establishment of "purge committees" or conducting purge movements whose aim was to remove top officers who were loyal to postcolonial governments in an effort to ensure loyalty, integrity, and efficiency in government. For instance, as a result of the 1952 Revolution or the Free Officers Movement in Egypt, approximately one half of the senior officials of King Farouk's bureaucracy in Egypt fell victim of the purge committee (Palmer et al. 1988, p. 4).

### The Size of the Bureaucracy

Post-independence bureaucracies were clearly inadequate to the challenges of the revolutionary era. They were elitist, their number was small, and their structure was oriented toward control rather than development. Revolutionary regimes in the Arab world transformed the countries into bureaucratic states, whereby few areas of political, economic, and social life were free from government intervention in a way or another. As a result,

postrevolutionary bureaucracies expanded to meet the needs, demands, and responsibilities of the new era. In this sense, central development plans required the creation of numerous public organizational structures to implement proposed politics and objectives of these plans. Thus, it was deemed necessary to set up structures such as central planning boards and institutions of public administration (Jreisat 2009).

The size of the civil service was substantially affected. The number of governments' employee significantly increased as a result of the nationalization trend. For instance, the Egyptian bureaucracy expanded from 250,000 employees in 1952 to approximately 1,200,000 in 1970. Likewise, the number of ministries increased from 15 to 28 during the same period (Palmer et al. 1988, p. 4). This phenomenon of bureaucratic growth was not triggered solely by the staffing requirements of the bureaucracy and the newly acquired public sector. Bureaucratic expansion was also motivated by a conscious decision to use government services as a means of reducing intellectual unemployment among thousands of graduates emerging from the revolution's expanded education system. In Egypt, for instance, under the newly proclaimed "graduate policy," university students were guaranteed bureaucratic positions upon graduation (Palmer et al. 1988, p. 10). As years passed, however, the number of graduates demanding government employment exceeded the needs of the bureaucracy.

### The Composition of the Bureaucracy

The revolutionary coups not only affected the size of the civil service but also its composition. It is worth noting that with the advent of the European domination of the Arab world, natives, more specifically the elites, were encouraged to enter government service. As such, the gap between the bureaucracy and the masses remained large. Post-independence bureaucracies continued along the same lines, thus replacing one elite merely with another elite. Revolutionary coups radically altered the social composition of the bureaucracy. Free education policy (and the graduate policy in Egypt) democratized the bureaucracy by transforming it into a mass-based institution staffed by educated segments of the society.

### Bureaucratic Processes and Behaviors

In terms of processes, no fundamental change took place. Centralization had been pursued eagerly. The merit system, though in place in most Arab states, was ignored. Nepotism and favoritism, rather than merit and competence, served as the basis for recruitment. These mechanisms were used primarily to ensure control over the bureaucracy.

Likewise, bureaucratic behavior and indifference on the part of many officials were hard to change. The new regimes, once settled, soon returned to old bureaucratic practices – conformity with rigid rules, centralization, red tape, and pervasive corruption of all sorts. Low morale, low salaries, and fear from arbitrary actions contributed to the persistence and resurrection of old bureaucratic and dysfunctional behaviors.

### The Politicization of the Bureaucracy

The burden of social and economic development was not the only burden to be placed upon the shoulders of the bureaucracy. Bureaucracy was also responsible to effect ideological and philosophical changes through politicization. As defined by Farazmand (2009, p. 9), politicization is "an ideological process for indoctrination of the bureaucracy and the people dealing with it. Politicization injects certain ideological, political, and economic values toward specific goals and missions." For instance, during the Nasser era (1952–1970), the Egyptian bureaucracy was required to embrace socialism as an ideology and to impose this ideology upon the masses. The same applies to Libya under Qaddafi (1962–2013) and to Syria under the Ba'thist regime of the House of Assad (1963–present).

Ideologies die hard. The socialist ideology in Egypt, for instance, persisted long after the Nasser regime was over. "The dramatic shift in the public and foreign policy initiated by the Sadat regime did little to enhance the circumstances of the Egyptian bureaucracy. Socialism continued to be a key element in the ideology of the state. The revolution's infrastructure of the state planning,

price support, and public corporations remained dominant elements in Egypt's economic superstructure" (Palmer et al. 1988, p. 6).

### Controlling the Military

While coups were prominent in the 1950s and 1960s, this phenomenon was put into an end by the 1970s and the 1980s, and the Arab world since then has entered a state of stasis. Arab leaders who came to power through military coups feared the occurrence of counter-coups that might lead to overthrow their regimes. They, then, tried to either tightly control their military as is the case in Syria, Libya, and Yemen or marginalize its role as is the case in Tunisia while establishing and relying on a more powerful structure – the security state – instead. In Syria, to keep control over the army, most highest officials were derived from the Alawite minority – the loyalist supporter to the Ba'thist regime. The regimes in Yemen and Libya tightly controlled the army through appointing their elite and family members in commending positions.

### The Security State

The revolutionary coups of 1950s and 1960s ushered a new era of the most repressive regimes the region had ever had. In the first decade of the twenty-first century, most Arab republics were ruled by authoritarian leaders who increasingly used their growing political and bureaucratic powers to entrench themselves in office for decades (Lynch 2012).

Security bureaucracies have played an important role in enhancing the survival of authoritarian regimes in the Arab world. To ensure continuity, revolutionary Arab leaders established a robust "coercive apparatus" (Bellin 2005; Wedeen 1999) of authoritarian regimes that is rigid and over-immune against every sort of change. This apparatus has been characterized in most Arab presidencies with the monopoly of political life and the suppression of political opposition – the strict control over public sphere through the establishment of the security state – with the extensive network of intelligence services and oppressive policing (Lynch 2012; Wedeen 1999). In this sense, a state of emergency was legitimated by laws in many Arab states due to fear from further revolutions, and popular depoliticization became an increasingly observable phenomenon of public life. Accordingly, strikes, demonstrations, and public meetings were banned; newspapers were censored or closed down; civil societies were limited; and intellectual life was brought close to an end (Kiel and Hijal-Moghrabi 2017).

Arab regimes, set up by the 1950s and 1960s revolutions and military coups, failed in keeping up to their promises in establishing a modern state that is responsive to the needs and demands of the masses and in achieving social and economic development. Several decades after those revolutionary movements, Arab states are still lagging behind in economic and political development, social justice, and the provisions of services. Despite the dramatic change in the size and composition of most Arab bureaucracies, the gap between the bureaucracy and the masses persisted. Arab bureaucracies grew autistic, unresponsive to the needs of the people they are supposed to serve. In the same token, corruption prevailed, and Arab governments and institutions continue to rank in the lower half of the Transparency Index. It is not surprising that distrust in government and its institutions has become a common commodity.

## Third-Wave Revolutions: The Arab Spring Movement

Between December 2010 and 2013, the Arab scene witnessed a series of uprisings and protest movements, both violent and nonviolent, commonly known as the Arab Spring. For the first time after long decades of submission and silence, the Arabs in many Arab countries rose up against corrupt authoritarian regimes which they have, for decades, admitted to live under their reign. They rose up against poverty, corruption, poor services, and injustice.

The spark of the Arab Spring started in a remote area in Tunisia on December 10, 2010, when a young Tunisian graduate, Mohamed Bouazizi, whose necessity ended him up working as a street vendor, selling fruits and vegetables, set himself in fire after his cart, the only source of his earning, was confiscated by the police because he

did not possess the proper permit for its operation. His story immediately resonated across the Arab world, as it spoke to the woes of million others who share a common fate.

Observers reduced the causes of the Arab Spring to the dire economic circumstances in which the Arabs live (Maloney 2011). While poverty per se is not viewed as the region's real economic challenge (Maloney 2011), the main challenges lie in an endless list of socioeconomic problems, comprising economic structure, unequal wealth distribution, unemployment, underemployment, widespread corruption, low level of investment, cronyism, favoritism, inadequate infrastructure, rapid urbanization, and an inefficient public sector (Kiel and Hijal-Moghrabi 2017).

In many areas across the Arab world, including Egypt, Yemen, and the Sudan, problems of overpopulation, poverty, and illiteracy remained unresolved. Unemployment, underemployment, and uneven distribution of wealth are also common problems across the Arab world. With their rigid rules, procedures, and fiscal policies, Arab bureaucracies failed to play a dynamic role in stimulating the economy. They rather emerged as a major obstacle of economic development. As such, they failed in encouraging entrepreneurship and business activities and in prompting the creation of new jobs to assimilate the increasing numbers of graduated youths. To ease the pressure of excessive unemployment, bureaucracies and the public service expanded in size and expenditure to become the last resort and safety valve.

However, little, if any, has been gained from the Arab Spring. Several years after the Arab Spring revolutionary movements, Tunisia is still struggling to achieve democratic reforms and achieve growth; Egypt is caught up in a vicious circle of repression; and Syria and Yemen are drawn into endless civil wars that claimed the lives of thousands. In fact, these uprising movements have generated more turmoil in the Arab world and affected the ability of the bureaucracy to deliver adequate public services. Likewise, as a consequence of the protests, government expenditures increased dramatically, which worsened the budget deficit of those states.

## Conclusion

Since independence, Arab bureaucracies have played an important role in nation building and in the institutionalization of governance and administration. However, they fell short in assuming a dynamic role in promoting and achieving social and economic development. Likewise, Arab bureaucracies have failed in achieving progress in areas of political participation and citizen engagement in governance. This is, actually, not surprising because promoting such democratic ideals "would put bureaucracies in disagreement with the desires of political leaders who, in general, rule autocratically and pack government senior posts with relatives and loyalists" (Jreisat 2009, p. 588) to ensure forceful control over their bureaucratic machinery. After all, most Arab regimes are primarily concerned with ensuring system continuity and survival. Under such conditions, it is no wonder that professionalism and neutral competence are in short supply in most Arab bureaucracies and nepotism, patronage, and corruption are the norm.

Unfortunately, bureaucracies in the Arab world did not take advantage of the positive side of the bureaucratic model. They have, rather, experienced the downsides of this model. Hence, they grew rigid, slow, pathological, dysfunctional, undemocratic, and unresponsive to their people's needs and demands and, more importantly, as an impediment for economic growth and development.

Revolutions in the Arab world did not result in the magnitude of change that was hoped for from such movements. This can be explained partly by the very nature of the bureaucracy itself which is slow and, even, resistant to change and, partly, by the social and political culture in which those bureaucracies are embedded and which greatly shapes how bureaucracies function. Hofstede (1980) used the concept of cultural determinism to refer to the fact that every managerial act is the inevitable consequence of its cultural antecedents.

Cultural change, as Inglehart and Welzel (2005) argued, is "path dependent; different societies follow different trajectories when subject to the same forces of modernization" (p. 21). The

main reason is that cultural traditions have proven antifragile and far more persistent than one can imagine because they shape, and even dictate, how societies and their institutions develop (Kiel and Hijal-Moghrabi 2017).

Cultural change in the Arab world is only possible when democratic values and ideals find their way to the Arab states. Such democratic values emphasize public debate, free public forum and mass media, transparency, and accountability for results. This, in turn, necessitates economic growth and development. Inglehart and Welzel (2005) demonstrated that modernization is a process of human development, in which economic development gives rise to cultural changes that make individual autonomy, gender equality, and democracy increasingly likely. As such, Arab bureaucracies are called upon to assume their role in the development process, to enhance transparency, and to promote a more responsible and accountable governance. At the heart of this process is the need for gradual structural social, economic, political, and institutional transformations.

[2]Department of Public Administration, University of Twente, Enschede, The Netherlands

## Synonyms

Co-production; Direct service delivery; Outsourcing; Public-private partnership; Service delivering; Service provision

## Definition

Bureaucracy: A body of nonelective government officials or an administrative policy-making group

Service delivery: Passing a service to a client.

## Introduction

Bureaucracy has been involved in the service delivery in one way or another throughout the

formation of bureaucracy's history. *Bureaucracy* can be defined as a body of nonelective government officials or an administrative policy-making group. Bureaucracy has several roles in forming the environment of the citizens: they must make decisions about influential impacts to local life and community and they have the obligation to provide public services. According to Alford and O'Flynn (2012), the term *service delivery* is typically used to refer to the provision of outputs (such as welfare benefits, school classes, roads) rather than outcomes (such as mitigation of poverty, improved literacy, road safety). In addition, it mostly implies to the service provision to the clients of the government entities and not to the entities themselves. According to Torres and Pina (2002), the public services can be delivered (in addition to inhouse provision) by government corporations, franchising, in association with public and private entities, in association with other municipalities, or by nongovernmental organizations, including voluntary organizations. To choose the most suitable for a specific service is a difficult task.

This entry aims to classify the possibilities of public service delivery from the bureaucracy's point of view, following the natural evolution of the service delivery. In addition, the advantages and disadvantages of each service delivery method are briefly discussed. The possibilities are introduced through the framework of three main paradigms in the Anglo-American public administration literature: "Old" Public Administration, New Public Management, and New Public Governance.

## Direct Service Delivery and "Old" Public Administration

The bureaucracy as a major producer of services is a rather recent concept (Alford and O'Flynn 2012), emerging since the late nineteenth century. Before that, the rulers at the time used extensively the services of private actors and community-based provision. One must note that many services (such as social services, state welfare) were nonexistent, and the typical governmental functions were limited to defense, foreign affairs, postal services, and the making of laws to regulate private actors (Alford and O'Flynn 2012). Since the industrial revolution and emerging middle-class, the social problems intensified, leading to proposing that social services such as education, health care, housing, and income security would become publicly provided. After the Second World War, due to the big economic growth in the 1950–1970s, the governments were able to raise revenues without increasing the tax rates unduly, which in turn heightened the expectations to the public service provision.

The main paradigm, which characterizes that era, is now named "Old" Public Administration (OPA) by the researchers in the public administration. OPA has the following characteristics (Denhardt and Denhardt 2000): politically neutral, focusing on direct delivery of services. According to this approach, the best organizational structure would be a centralized bureaucracy, with top-down control mechanisms, limiting discretion as much as possible. Bureaucracies seek to be closed systems to the extent possible, thus limiting citizen involvement. Efficiency and rationality are the most important values in public organizations. Bureaucracy does not play a central role in policy making and governance; rather, they are charged with the efficient implementation of public objectives. In case of OPA, the results of public agency are fixed by laws and accounting techniques (information about costs). In that period, most of the services were delivered directly by the bureaucracy.

## Outsourcing and New Public Management

After the boom comes the bust, in the 1970s, opposing trend arises, in which the "big government" was considered to be too strong and regulating excessively. The economic crisis tightened the fiscal situation of governments and the increasing pressure to governments' entities (public agencies, municipalities, regions)

imposed by growing scale of social and economic processes and the growing power in terms of tasks and competencies were forcing the entities to elaborate the ways of delivering public services. One frequently used option was to privatize some government functions, which was implemented first by the Thatcher administration in the United Kingdom. This was mainly justified by the will to withdraw the governments' share in the market production, which in turn would lower public debts and limit money supply. Another cause was to reduce the influence of labor unions in the government decision-making and to intensify the private markets and gain political support.

In the public administration literature, more focus went from then on to business-like management approaches, labelled under New Public Management and popularized by Hood (1991), Osborne (1993), etc. The NPM approach took off in the 1980s and has influence on public reforms to date. The NPM opposed the traditional OPA approach, as Hood (1991) points out its main doctrines: hands-on professional management, explicit standards and measures of performance, greater emphasis on output controls, shift to disaggregation of units in the public sector, shift to greater competition in public sector, stress on private-sector styles of management practice and on greater discipline and parsimony in resource use (efficiency improvement). So, in that era, in addition to privatization of services, also outsourcing and contracting-out took place.

There are many ways to deliver public services: by government corporations, franchising, in association with public and private entities, in association with other municipalities, and by non-governmental organizations including voluntary organizations. Delivery via each and every one of them has its strengths and weaknesses.

*Government corporation (or government-owned corporation)* – a corporation set up by a national or subnational government to carry out business transactions for its behalf – is one way to deliver public services. The delivery through government corporations differs from direct delivery as government corporations have greater commercial freedom and are usually operating according to commercial criteria. Furthermore, the production and delivery decisions are not generally taken by government even though the goals for government corporations may be set by government. Through the government-owned corporations, government can directly fund unprofitable business, e.g., railway services to remote areas. Government-owned corporations are common in case of natural monopolies and infrastructure (e.g., railways, telecommunications), strategic goods and services (e.g., postal services, weapons), natural resources and energy, politically sensitive businesses, broadcasting, banking, demerit goods (e.g., alcoholic beverages), and merit goods (e.g., healthcare) but also in local level water distribution and central heating. Government-owned enterprises cannot be declared bankrupt as government is responsible for its liabilities.

*Franchise agreement* is an arrangement in which bureaucracy grants a private organization (or organizations) authority to provide a particular public service within a certain geographic area, e.g., bureaucracy, instead of providing trash collection, may grant a franchise to a private collector who is then authorized exclusively to sell the service to residents in that jurisdiction. The primary benefit to franchising is that it allows a government to completely turn a service over to a private firm, while still allowing government officials to set service standards, levels, and rate structures. The citizen pays the provider directly for a service received instead of paying for the service out of general tax. The local government may regulate the service level, quality, or price charged. Franchising is used most frequently for residential and commercial solid waste collection, public utility functions, airport operations, vehicle towing and storage, and ambulance service and emergency medical service. The first concern about franchising is the issue of equity, i.e., all citizens, regardless of income, receive essential public services. This is an issue every bureaucracy has to look into, i.e., how much franchising will affect equity and what can be done about it

(e.g., providing vouchers for low-income citizens). Secondly, franchising may arise legal concerns as only private organization(s) receiving a franchise agreement are allowed to participate in the public service delivery and others are excluded. Finally, franchising tends to work best when citizens are knowledgeable about what various providers have to offer (assuming more than one firm receives a franchise) and can freely and easily change providers. However, there is a concern that citizens may have to pay more if there is a lack of competition among providers.

*Public-private partnership (PPP)* can be defined as typically a long-term agreement between a private party and a government entity for providing public service in which the private party bears significant risk and management responsibility, and remuneration is linked to performance. Public-private partnerships may contain varying degrees of risk, i.e., leaving the public entity exposed to fiscal and/or political fallout if proper due diligence does not occur, if the private partner fails to perform, or if expected project outcomes do not happen.

*Intergovernmental contracting* is an agreement made between two or more (subnational) governments to cooperate in public service provision. Intergovernmental contracting can improve services, save money through economies of scale, and lead to a culture of intercommunity cooperation in many areas. However, from the negative point of view, intergovernmental contracts can, by consolidating resources, reduce local control. This loss of some local control can produce a voter backlash, especially if not accompanied by commensurate local tax reduction.

*Nongovernmental organizations including voluntary organizations*. The use of nongovernmental organizations is a common practice in certain service areas such as fire, recreation, and human services. Outsourcing services to those organizations is beneficial in many ways. Firstly, in case of low-level competition in service market, nonprofit organizations including voluntary organizations are highly seen as an alternative. Secondly, bureaucracy, faced with declining resources and, in most cases, increasing demands for services are using voluntary organizations as one potential alternative for coping with such a complex environment. Furthermore, as those organizations have often been a familiar part of subnational government operations, it is easier to include those organizations. And finally, often voluntary organizations are not given direct compensation, although they may receive reimbursement for "out of pocket" expenses.

The movement towards outsourcing public services was based on public choice assumptions (increased choice, efficiency concerns, objective for better alignment of managerial objectives with citizen concerns, and promotion of local economic development) (Savas 1987; Osborne 1993). Outsourcing as one form of delivering public services is well discussed among scholars. Interesting in here is that the scholars are divided into two: one part is praising this form of public service delivery and the other one is completely against it. Proponents argue that such market-oriented strategies are important for improving the efficiency and effectiveness of public services, therefore reducing the costs and relieving the local governments' fiscal stress. At the same time opponents are saying that outsourcing leads to inequities in public services and carries substantial risks of waste or fraud; it often hollows out the expertise and problem-solving capacity from the public sector. It may also lead to inflexibility and create coordination difficulties concurrently making the government less accountable to its citizenry. There are also made several case studies to approve the views of one or another side.

## Co-production and New Public Governance

After and alongside the heavy privatization and outsourcing wave of government functions, the unfulfilled promises of efficiency gains and increases in service quality resulted in varied options to alternate the service delivery. Although one of the NPM initial ideas has been the

decentralization and horizontal specialization in public agencies, it has been evident that there is an increasing need for coordination and coherence in public policy, which has resulted in the re-centralization and restoration of the hierarchy (Christensen 2012). This process has been defined as post-NPM reform and has been the reaction to the "pillarization" of the public sector (Pollitt 2003) – the structural devolution encouraged by NPM ideas had ignored the need for horizontal planning and coordination (Fimreite and Lægreid 2009).

Following NPM, the post-NPM has key concepts of coordination, centralization, governance, networks, and partnerships (Christensen 2012). Christensen (2012) also argues that both approaches have overlapping and are not exclusive when discussing reform tools. This includes initiatives involving co-production by citizens, volunteers, or clients, along with nonprofit organizations. In the light of concerns about citizen engagement and the role of government, since 2000 the arrangements of service delivery have become more diverse and comprehensive (as well as more complicated) as more attention has been given to social choice concerns on the interaction between citizens and government (Denhardt and Denhardt 2000). Bouckaert (2009) describes the zig-zag action-reaction character of public reforms, meaning that the reforms follow a sequence of finding a solution to a problem created by the last reform. This sequence is never-ending. The last decade, however, has not seen a dominant model of public management (Pollitt and Bouckaert 2011), which is also true for the service delivery methods.

The concept of co-production emerged as it was recognized that services rely as much upon the unacknowledged knowledge, assets, and efforts of service users as the expertise of the professional providers, i.e., far from being passive consumers or needy drains of public finances, people in community is understood as important agent with the capacity to design and deliver services with improved outcomes. Co-production as not only a method but also a mind-set of service delivery is very different from other service delivery models discussed above. It fundamentally alters the relationship between service providers and users as well as emphasizes community as active agents, not passive beneficiaries as it has been so far. However, the radically different nature of this service delivery method is also a reason of many significant challenges that the ones wishing to use this method are facing. The biggest challenge in establishing co-production is existing structures and frameworks of service delivery. Firstly, the size – the co-production suits better to smaller organizations (traditionally those in the third sector) that are more used to working in less structured and hierarchical ways. Secondly, development of professional skills required for co-production (e.g., seeing customers through wider perspective). Thirdly, community has to start seeing itself as the ones that can make a difference – i.e., "clients" are not anymore passive receivers of a service. The criticism about the co-production has mainly been about blurring the lines of responsibly for the quality of services, and the services will look different in different areas as the resources and needs identified by communities in different areas are different.

## So, Which Delivery Method to Which Service?

As discussed in the previous sections, there are many ways for public service delivery. For each service delivery option, there is a theory that would justify the use of exactly this delivery option. However, there are two indicators – the presence of competition and service characteristics – that help bureaucrats determine whether or not to outsource a particular service and what kind of delivery method to use. The thumb rule is that only those public services will be outsourced which will have some competition. The presence of competition is important to guarantee the best ratio between the quality and price for the citizens. In case of services with no competition or in case the service is provided in low-competition area, the services are provided by (subnational) government itself. The service characteristics –

properties of scale economies, asset specificity, and measurability – are important in determining which service delivery method to use, i.e., should the service be delivered in-house or contracted out and in case of contracting out – what kind of contracting to use. Services with obvious properties of scale economies (e.g., urban transportation, garbage collection, and water sanitation) often are mentioned as strong candidates for intergovernmental contracting because of the expected cost savings from large-scale projects (LeRoux and Carr 2007). Asset specificity of a service means whether specialized investments are required to produce or deliver the service. When asset specificity is relatively low, the service is relatively standard and may be purchased from a variety of suppliers, i.e., transactions are standardized (as opposed to customized) and the private market could be an efficient means of production. Service measurability means, how easily service outputs can be measured (or observed). Governments are usually providing easily measurable services via external providers.

## Conclusion

The increasing pressure to bureaucracy imposed by growing scale of social and economic processes and the growing power in terms of tasks and competencies are forcing bureaucracy to think more and more about the ways of delivering public services. Delivery options like privatizing, outsourcing, collaboration, partnerships, and co-production have all been in one or other way the so-called "flavor of the month" pushed onto bureaucracy either by instruction, exhortation, legislation, or financial necessity. This brief overview was discussing the options for public service delivery following the history of public management theories.

## Definitions

| | |
|---|---|
| Bureaucracy | Nonelected government officials characterized by the specialization of functions, adherence to fixed rules, and a hierarchy (adjusted from Merriam-Webster 2020). |
| System maintenance | Maintaining the stability of the current elements of the system and creating conditions for its sustainable development. |

Bureaucracy permeates all state authorities to regulate their areas of responsibilities. Effective bureaucracy means a balance between costs and results. When this balance is violated, bureaucracy becomes inefficient (Klimenko and Barabashev 2017). For instance, excessive regulation leads to excessive costs negatively affecting the stability of the system maintenance. Bureaucracy develops a set of rules that evolve into state policies. The effectiveness of national bureaucracy depends not only on the quantity of policies developed, but also on the quality of their implementation. Efficient bureaucracy supports the stability of the state and the political system. Bureaucracy develops administrative procedures and maintains security. Performing these functions may lead to an imbalance in the costs (Farazmand 2009). The bureaucracy determines the rules that affect the entire system under its control. An imbalance in organization and goals leads to the inefficiency of the bureaucracy. By issuing policies, national bureaucracy directly affects the economic system, including its economic growth (Libman 2017). National bureaucracy ensures the system's sustainability and its development through legislative activities. (These systems could be the medical system, the insurance system, the educational system, and the banking system, comprising the state system in its entirety.) To ensure systemic economic and political viability, the state uses various tools of influence. Their effectiveness depends on the characteristics of the target system.

Bureaucracy carries out its operations through the calculated expenditure of funds and the conclusion of agreements with private entities. An important factor for effective bureaucracy is strict budget control and a sufficient level of judicial regulation. Poor control over bureaucracy results in payoffs to bureaucrats (Farazmand 1989). In contrast, an effectively functioning bureaucracy ensures the stability of the political system and the implementation of established rules. Ideally, bureaucracy should be balanced between performing administrative procedures and performing security tasks. Maintaining this balance maintains the system's stability.

State regulation is a tool of the rational administration determining the rules of activity and the procedural aspects of the system (Whatcott 1974). Every system consists of various elements. State policies developed and enforced by bureaucracies affect these elements. One unifying feature for all systems is interaction between people, including the legislative bureaucracy that produces systemic policies, on the one hand, and the populace regulated by these policies, on the other hand. All systems inevitably generate the so-called "behavioral factor" (Maslenikov 2000). Bureaucracy supports the stability of the state, but it consists of individuals with varying professional qualifications and convictions. In this regard, when

changing the political course, it is also necessary to ensure a change in the personnel composition of bureaucracy. The evolution of the state requires the development of a modern public administration, the effectiveness of which depends on the individual bureaucrats and target audience. The analysis of behavioral factors is one of the key elements to ensure system maintenance.

A governmental employee should follow the rules when making a bureaucratic decision. However, the lack of necessary qualifications usually leads to faulty decision-making. A lack of qualified governmental employees dramatically decreases the performance of administrative procedures (Farazmand 1994). As a result, even if there is a developed regulatory system supported by perfect bureaucratic policies, there may be errors due to the "behavioral factor." The "behavioral factor" depends on the individual goals of employees responsible for system maintenance. State regulation heavily depends on the mechanisms of the "behavioral factor" in the system. Even if there is a developed set of policies, an employee might not possess the qualifications or willingness to fulfill their obligations. The goals of a civil servant may not correspond to the goals of the state body and state policy. This mismatch of goals leads to bureaucratic inefficiency. This problem is closely related to the topic of Public Service Motivation (Gans-Morse et al. 2019).

The system is a complex organism involving various areas of activity. In order to ensure economic growth, bureaucracy must maintain the system's sustainability. Bureaucracy influences the system through developing and maintaining different policies and regulations. The bureaucracy's policies depend on its objectives, including goals to achieve the targets. The "behavioral factor" is embedded in all systems consisting of people and may affect the attainability of the state's goals.

Researching the "behavioral factor" is pivotal for determining and improving a bureaucracy's effectiveness in the regulation of its systems. This essay contains theoretical aspects of the systemic approach and the adaptive, reactive, and active types of behavior (Maslenikov 2000). The analysis can be applied to the interaction of bureaucracy and systems in different areas, such as insurance systems, pension systems, the medical system, and the educational system. These systems include the "behavioral factor" affecting their functioning.

B

## The "Behavioral Factor"

The "behavioral factor" of the system depends upon decision-making mechanisms. External users, such as consumers, state, and banking bureaucracies, ensure the system's cohesion and internal links. The influence of bureaucratic policies on the system depends on the "behavioral factor" (Maslenikov 2000). All systems pursue their own internal objectives. Bureaucracy, using available tools, regulates the system. If bureaucracy regulates without considering the "behavioral factor," this may negatively affect the system. The system consists of various policies reflecting guidelines produced by the bureaucracy, which should strive to create institutional conditions to implement the most favorable behaviors. Based on Blauberg's theory, the following types of system behavior have been identified: *active*, *adaptive*, and *reactive* (Maslenikov 2000) (Table 1). These types of behavior are common to all systems. The type of behavior may change depending on external conditions and the information received. Bureaucracy affects supervised systems by causing certain behaviors.

*Active behavior* implies the subject's ability to influence bureaucracy usually through lobbying. As a rule, active behavior is implemented through associations, labor, trade, and production unions. Associations and unions can hammer out a shared opinion and present it to the bureaucracy in order to adjust the policy. Active behavior leads to changes in the external environment and can also be implemented through active interaction with civil servants in the framework of joint events, conferences, sending official requests, etc.

*Adaptive behavior* takes into account the influence of the organizational environment on the system, and the system's reaction to it. The system's adaptive behavior assumes that subjects of influence receive signals from the bureaucracy,

**Bureaucracy and System Maintenance, Table 1** The "behavioral factor" in terms of systemic approach

| Types of behavior | Description |
|---|---|
| Active | The object of influence affects the subject of influence. An example of this behavior is the influence of middle enterprisers on the Ministry of Economy though lobbying |
| Adaptive | The object of influence experiences the influence of the subject, but has the ability to adapt to it independently, providing internal resistance. An example of this behavior is the implementation of bureaucratic supervision requirements |
| Reactive | The object of influence precisely fulfills all the requirements of the subject of influence taking no action. For instance, the Ministry of Economy has introduced favorable tax conditions, but no business actors express interest in using them |

Source: author based on Maslenikov (2000)

but also have freedom to implement the proposed recommendations. The bureaucracy issues requirements to subjects and they must comply. For example, the bureaucracy introduces supervisory norms. Individual approaches to fulfilling supervisory norms remain the subjects' strategic decision. Occasionally, local bureaucracy distorts the terms provided to subjects for a variety of reasons. Even in this case, the regulated system must demonstrate adaptive behavior.

*Reactive behavior* is associated with the reaction of the system to external influences. The higher the degree of reaction, the stronger the predominant reactive behavior in the system. This type of behavior assumes that bureaucracy determines the parameters of the system, and the system's subjects execute the bureaucracy's requirements. Subjects do not determine the method of execution of the received signal. They do not react to the bureaucracy's policy. An example of this behavior is the creation of subsidies that businesses do not use.

Bureaucracy encounters all three types of behavior which provide different challenges to the system. The type of behavior largely depends on the identical nature of the objectives of the bureaucracy and the regulated system. They could have different objectives some of which are aligned, some of which are not. All types of system behavior occur, but, in noncrisis conditions, there should be a predominance of adaptive and active behavior. During crises, increased governmental involvement enforces reactive behavior, supporting the system's maintenance and sustainability by manually managing the system. The formation of behavior types depends on cultural and educational factors. The type of behavior is also influenced by the previous experience of interaction between the system and the bureaucracy. Systems can develop certain algorithms and behavior models which are applied depending on the signal being sent by the bureaucracy. All three types of behavior are systemically essential to counter all potential challenges capitalizing on the human and social capital of its employees.

Different systems are also associated with the "behavioral factor." Accounting for behavioral aspects is necessary to improve the effectiveness of the regulatory system. Clear rules of regulation and the high qualifications of officials will improve the effectiveness of the bureaucracy. The bureaucracy itself will be less susceptible to the "behavioral factor," because it has a clear regulatory framework. The "behavioral factor" still exists but the bureaucracy's internal processes are less subject to it. Government bodies operate slightly differently in comparison to commercial bodies. The duality of the situation is underpinned by the imminent clash between state and private bureaucracies which originates in the "behavioral factor." The employees of a commercial body are oriented toward profit generation, whereas the bureaucrats are oriented toward system maintenance. Although a clear regulatory framework reduces the impact of the "behavioral factor," the bureaucracy tends to constantly grow, reaching a state of inefficiency. In this regard, it is necessary to analyze the powers of bureaucracy and reduce redundant functions (Klimenko and Klishch 2013). Encouraging the desired type of behaviors within the bureaucracy is possible through the use of performance indicators.

## Conclusion

The bureaucracy is responsible for maintaining the system's stability. This largely depends on the qualifications and efficiency of civil servants. There is a "behavioral factor" in all interactions between a bureaucracy and a system. The "behavioral factor" affects system stability through three types of behavior: active, adaptive, and reactive. The types of behavior of a regulated system depend not only on internal factors but also on the preferred bureaucratic policy. Bureaucracy faces the challenge of how to select and maintain the desired type of behavior depending on the economic situation. A thorough understanding of the "behavioral factor" characteristic for specific bureaucracies and systems is key for system maintenance.

| Spending review | Managerial process introduced by bureaucracy in order to reduce public spending |

## Introduction

After several years from the advent of the global financial crisis, the economic situation of many of the world's most advanced countries still seems to be affected by its startling consequences. This situation, characterized by international calls

for interventions to promote growth and foster fiscal consolidation and financial sustainability, is a direct consequence of the 2008 financial crisis. Many governments have tried to address these issues following *pro-cyclical* fiscal policies (OECD 2011). This choice refers to the strategy of decreasing spending and increasing revenues (tax and public services incomes). While this option is the more direct with the achievement of financial sustainability and fiscal consolidation, as a matter of fact, it is quite difficult to be implemented because it is characterized by the struggles in reducing spending.

In order to reduce public spending, many countries launched austerity action plans, even characterized by the introduction of *New Public Management* (NPM) reforms aimed at increasing the efficiency of bureaucracies. This brief chapter discusses the introduction of the spending review as tool inspired by the NPM movement.

In particular, the objective of this work is to present the potentiality of spending reviews in reducing public spending in bureaucracies, by examining this tool and its differences with other budgetary and regulatory tools of bureaucracies. Finally, in the conclusion, some concerns about the challenges in implementing spending reviews are presented.

## What Is the Spending Review?

In common terms the spending review may be defined as a budget revision process that consists essentially of an analytical evaluation of all of the expenses of a bureaucracy with the general goal of reducing its total amount of expenditures. In some cases, this review aims at containing the level of public spending through the identification and implementation of nonlinear expenditure cuts based on an analysis of performance evaluation, while in other cases the main review's purpose is to re-prioritize base expenditures, in order to identify space for new spending proposals or investments. In both cases what characterizes the spending review is the prioritization of different spending components within a general framework of expenditure reduction. Indeed, both in the selection between different spending proposals and in the application of nonlinear cuts, there is a work of ranking and prioritization. Within the spending review, this element of prioritization specifically aims at containing public spending. Thus, the essential idea is that it is possible to reduce public spending through a performance evaluation that leads to the identification of opportunities for nonlinear budgeting cuts or new spending priorities.

In this perspective, the spending review represents a novelty because it mixes together different elements generally associated to several managerial practices, such as budgeting procedures, instruments of regulatory policy, or the practices of performance evaluation. However, as a matter of fact, it perfectly fits within the New Public Management framework.

## Connections Between Spending Review and NPM

According to Lapsley and Midwinter (2010), the spending review process represents a revival of New Public Management practices (Hood 1991, 1995; Barzelay 2001). Indeed, for the authors, the spending review is a process that identifies possible areas of intervention and the actions needed to contain expenditure, by evaluating spending through the general concept of efficiency.

The NPM represents a new global paradigm for bureaucracies that points on the adoption of managerial approaches and methodologies borrowed from private sector organizations, based on efficiency and performance evaluations. According to Olsen and Peters (1996), while there is not a unique model of NPM, its central elements concern the introduction of managerial practices in bureaucracies (governance without government) and the use of market mechanisms. In this perspective, according to the NPM doctrine stated by Hood (1995), there are several elements of connections with the introduction of the spending review as managerial tool of performance evaluation:

- Disaggregation of bureaucracies into separately managed units (cost centers) for public sector product/service
- Greater competition between bureaucracies and the private sector
- Greater stress on discipline and parsimony in resource use and finding alternative less costly ways to deliver public services
- More explicit and measurable standards of performance for public sector organizations
- Attempts to control public organizations according to preset output measures

## Similarities and Differences from Budgeting, Managerial, and Regulatory Tools

While the spending review clearly takes inspiration from the NPM initiative, in terms of process, it seems to be a hybrid object. Indeed, it appears quite close to other tools related to the NPM (such as performance budgeting and regulatory instruments), but, at the same time, it presents several elements that makes it as a distinctive instrument.

The main element that distinguishes the spending review is its use of the prioritization of spending within a general framework of expenditure reduction. This approach presents several connections with the normal procedures of the *budget process*. Indeed, the spending review works for identifying savings that, in order to be really effective, will be inserted into the budget. This adjacency between the spending review tool and the budget process is confirmed by the fact that many bureaucracies have deliberately and fully integrated spending review practices within the budget preparation process. However, as suggested by OECD (2013), the budget process focuses excessively on the consideration of new spending proposals, with little review of baseline expenditures. Indeed, one of the main deficiencies of the budget process is the lack of specific procedures of ex post evaluation of spending. Thus, it happens that the production of new spending is generally not accompanied by a critical evaluation of the effectiveness of the current expenditure base. An extreme consequence of this lack of ex post evaluations is the possible proliferation of expenditures (typical of several budgeting experiences) that occurred under the logic of budgetary *incrementalism*. In times of austerity, the same practice has been labeled as *decrementalism* (see, i.e., Schick 1983; Behn 1985). The literature generally assesses these budgetary logics as highly ineffective (i.e., Levine 1985; Berry 2009). On the contrary, the approach toward evaluation typical of the spending review directly clashes this logic by proposing a prioritization of spending instead of a mutual and linear treatment of different spending components or programs. Under this perspective, the spending review represents a novelty in the budget process. Indeed, it involves a reestablishment of the role of the center (the head of the organization) in prioritizing and reallocating resources by recognizing that only with the evaluation of current base expenditures it is possible to create adequate room for new spending priorities and investments.

Several bureaucracies, in order to enforce the budget process, developed and applied specific *performance budgeting* procedures. After the 1960s, there has been an increasing use of this system. OECD (2007) shows that in recent years many countries institutionalized these types of practices. Performance budgeting essentially consists in the introduction of performance evaluation procedures into the budget process. OECD (2007) defines this system as a specific form of budgeting that relates funds allocated to measurable results. Through performance budgeting, the budget expenditures are classified in different programs in relation to their objectives and the types of services. In this way, the performances of programs are evaluated in terms of outputs and outcomes produced. This different organization clashes with the normal structuration of budget that classifies expenditures in relation at their organizational structures of reference (ministers, departments, and units). Therefore, performance budgeting can be generally defined as a methodology that classifies and associates the budgeting expenditures to their performances. Then the main purpose of the system is to rely programs to their

outcomes in order to assist and inform the budget preparation process. In these terms, the relationship between performance budgeting and spending review clearly appears. Indeed, like in the spending review, performance budgeting uses data and information concerning the performance of programs to guide policy-makers in new budgeting allocations, by providing guidance on the areas to cut back or on the programs on which to increase spending. In this way, the budget is built not only incrementally but also through the evaluation of the performances of its different components. Indeed, one of the main reasons to introduce performance budgeting was the improvement of spending prioritization into the budgeting preparation process. However, academic literature (e.g., Moynihan 2006; Helmut 2010; Schick 2014) suggests that the introduction of performance budgeting does not ensure that countries necessarily use performance information in the budget preparation process.

Bureaucracies' experiences demonstrate that the use of performance evaluation into the budgeting process does not ensure that performance information is automatically taken into account in assessing budgeting priorities and allocating new resources. This fact confirms that the placement of spending review within the performance budgeting arena is wrong. Indeed, performance budgeting must be seen as a system that simply introduces performance information on programs into the budgeting developing procedures, but it does not necessarily ensure the effective utilization of those data and information to assess new spending or to evaluate across different savings options. On the contrary, the spending review should be seen as a mechanism that identifies different savings options or reprioritizes spending within the budget, through the use of performance evaluations of base (and new) expenditures. In other terms, differently from performance budgeting, the spending review represents that tool that helps policy-makers in applying budgetary savings along a performance evaluation approach, while performance budgeting is a broader process that provides information on the performance of programs into the budget, not just restricted on spending containment. Thus, performance budgeting can be a good starting point to develop a proper spending review process, since the spending review has a narrower scope than performance budgeting. Moreover, the spending review may be seen more as a managerial process than a budgeting procedure. To confirm this view, there are many experiences of spending review openly disjointed from the budgeting process.

Another important element differentiates the spending review from the arena of budgeting instruments. Sometimes, in the spending review, the definition of different saving options takes place through regulatory and managerial processes rather than as mere budget exercise. In other terms, in the spending review, the identification of possible spending reductions is usually obtained across managerial and regulatory practices. For instance, in many cases the spending review interventions are represented by managerial improvements applied to specific processes or operations of public organizations, such as the introduction of ICT systems or the adoption of administrative best practices. In these cases, the spending review process is more similar to an operational improvement rather than a budgeting intervention, while in other cases the spending review savings are represented by modifications or removals of current regulation and regulatory burdens. For instance, some spending review interventions, such as the cutback of public sector workers, cannot prescind from specific modifications of the preexisting norms or regulations (in this case public labor regulation). Many spending review presented this type of intervention. For this and similar cases, the connection with the budget is a mere consequence of the modification of regulation. Indeed, the achievement of savings does not depend by budget adjustments but rather by the revision of those specific norms that regulate the amount of staff and the rules of layoff. Thus, the spending review presents strong connections with the field of regulatory policy.

Regulatory policy can be defined as the government effort in improving the production of coherent and effective regulations with the best advice evidence available. Among the regulatory policy tools, one in particular – the Regulatory

**Bureaucracy and the New Public Management, Fig. 1** The hybrid nature of the spending review

Source: Author's own elaboration.

Impact Analysis (RIA) – presents several correlations with the spending review. RIA is a tool generally used by governments to improve the quality of the decision-making processes. This instrument is an analysis that tries to inform policy-makers on whether and how the regulations are achieving public policy objectives. It can be defined as a systematic examination of the impacts produced by new (in the case of ex ante RIA) or existing regulations (in the case of ex post RIA). In other terms, the RIA tries to outline the effects produced by regulatory actions (programs, policies, and regulations) by considering (and trying to quantify and monetize) the costs and benefits of those interventions. In this sense, the experiences of spending review and RIA present many communalities, and for some perspectives the spending review may be seen as a particular form of RIA made on current (ex post) or new (ex ante) regulation with a focus to assess the financial impacts, especially in terms of expenditure reductions.

At the same time, however, there are also some elements that openly differentiate the RIA from the spending review. The RIA aims at assessing different types of impacts (especially, economic and financial effects) of new and base regulations. However, this does not implicate that RIA identifies different saving options or how to reduce spending. Moreover, even when the RIA openly investigates the impact of regulatory proposals in terms of spending reduction, this does not necessarily mean that the policy-makers will apply the RIA's findings to undertake a real reduction of base expenditure, as the spending review actually aims at doing. Thus, the mere identification of spending review into the arena of RIA procedures is not completely valid. There are many similarities, but, in the end, RIA and spending review are two distinct tools.

Thus, as discussed, the spending review presents at the same time many elements of connection and specific differences with four distinct areas: budgeting, performance evaluation (performance budgeting), public sector management, and regulatory policy. As a consequence, the spending review can be seen as a hybrids tool that overpasses these regulatory and budgetary tools (Fig. 1).

## Conclusion

As presented in this work, the spending review can thus be presented as an exceptional tool to achieve a strategy of expenditure containment, bringing together elements covering several fields such as budgeting, performance evaluation (performance budgeting), public sector management, and regulatory policy.

Thus, why the outcomes of spending reviews are contradictory? Why sometimes it results ineffective? Indeed, despite its potentiality and the new institutional attention toward this tool, to

date, there has been little evidence of the real results achieved by its application (Agasisti et al. 2015). Sometimes, the use of a spending review achieved its objectives, and the countries that adopted it were able to reduce deficits and debt, while in other cases the application of the spending review did not lead to the expected results. As suggested by Catalano and Erbacci (2018), there are some peculiarities in the spending review process that may help in understanding why the outcomes resulting from its application are difficult to be reached.

- *Implementation process*: as managerial process one of the primary elements that influence the performance of a spending review may be its degree of diffusion and implementation: the benefits of applying spending reviews are conditioned by the degree to which this innovation is accepted and diffused inside of the organization that adopts it. Thus, many controversial results regarding the use of the spending review may be related to the degree to which this innovation (the spending review) is not completely adopted and diffused.
- *The need of social and political commitment*: to result really effective, a spending review requires both political commitment and social consensus over its whole process. Without the presence of these kinds of support, the resistance over the change and austerity interventions may emerge and overcome the entire project.
- *The paradox of time*: in order to complete its evaluation analyses, the spending review necessitates a long-term perspective (and adequate time) to be effective. But often this is not possible, and bureaucracy looks primary for immediate and short-term savings.

# Bureaucracy in Bangladesh: A Disaster Management Perspective

Nazirul Islam Sarker and Min Wu
School of Public Administration, Sichuan University, Chengdu, People's Republic of China

## Synonyms

Bureaucrats; Civil servants; Public administrator; Public bureaucracy; Public servants; Nonelected administrator

## Definition

Bureaucracy usually means a group of policymakers and administrators come from non-elective process who are characterized by particular skill and exercise the power of government or public administration under constitutional rules and hierarchy of authority.

## Introduction

Bureaucracy is a key instrument of modern public administration. Modern state executes various policy and programs and provides public services through bureaucratic machinery. An efficient bureaucracy has great importance due to its vital role in public affairs. The pattern and style of bureaucracy are almost the same all over the world through public administration passed a number of continuous reforms. The main strength of bureaucracy is its expertise in a particular field which is also a key tool for public policy decision (Siddiquee 1999). Though bureaucracy is an indispensable part of the government system, sometimes it is considered as a threat of democracy. In developing countries, bureaucracy uses their power under illegal support of elective representative and gradually becomes a democratic threat (Delaporte and Maurel 2018). Sometimes bureaucracy exercises over power and involves in corruption and behave like a master forgetting as a role of public servant. So, accountability and transparency are necessary practices of public administration to control and monitor bureaucratic machinery. Good governance is an important milestone to emphasize accountability and transparency of bureaucracy for ensuring better services to the citizen.

## A Brief History of Bureaucracy

Bangladesh is born in 1971 after passing a long history with various regimes. Today's bureaucracy of Bangladesh comes from various norms, culture, and practices of various Muslim rulers, Hindu kings, British rulers, and Zamindars. Particularly the British regime was very much influential for bureaucracy in terms of the structure of bureaucracy and its practices (Mollah 2011). In 1947, India and Pakistan were developed as an independent country where Bangladesh was considered as East Pakistan. Then in 1971, Bangladesh gets its independence from Pakistan.

As a legacy of British colonial rule, the bureaucracy of Bangladesh followed the pattern and structure of inherited British colonial rule though it faces several reforms and rehabilitation. Due to ruled by various rulers hundreds of years, few legacies are embedded in the Bengali's culture which also affects the bureaucracy of Bangladesh (Rahman and Tosun 2018).

In the seventeenth century, the British company came to the Indian subcontinent for trading and gradually encroaching administrative power from 1772 to 1813. They launched converted civil service (CCS) as a court of the directory by direct recruitment and then unconverted civil service (UCS) for short term by local recruitment. Only 84 Indians got recruitment as CCS but up to district level against top-ranked 2644 Europeans (Hossain 2017). But the bureaucratic practices of the British regime were stable and function properly. In Pakistan period (from 1947 to 1971), the Pakistani government launched civil service of Pakistan (CSP) following the style and structure of British colonial bureaucracy. But bureaucrats were developed through intensive 2-year training.

But there was no justification of the recruitment process between the candidate of east and west Pakistan for bureaucracy (Siddiquee 1999).

After getting independence from Pakistan in1971, the government of Bangladesh tried to transform the style of provincial administration for creating accountability of bureaucracy to the people. Bangladesh Public Service Commission (BPSC) was developed in 1973 to recruit the Bangladesh public administration. BPSC recruited more than 2000 cadres against 300 BCS class-I vacant post which was one of the starting points of politicization of bureaucracy in Bangladesh (Rahman and Tosun 2018). Though more than 37 BCS recruitment has been taken place but the bureaucracy is gradually losing their acceptance to people. Now the bureaucracy of Bangladesh is suffering from lack of accountability, transparency, motivation, monitoring, and supervisions (Khan and Rahman 2007).

## Characteristics of Bureaucracy

As a multiparty system, the parliament of Bangladesh is run by prime minister headed cabinet system with few ministers. The ministries are distributed to the ministers according to their expertise to deal with ministry-related policy matters. The secretary is the bureaucratic chief of a ministry and liable for its administration. A number of subordinates are working under secretary to implement the policy at the field level. The bureaucracy of Bangladesh is now largely characterized by politicization (Islam 2016). This politicization starts from the recruitment process of Bangladesh Public Service Commission as a recruiting agency of Bangladesh Civil Service cadre officer as a bureaucrat. The recruitment process is designed into two groups like special cadre and general cadre. Special cadre is mainly for special or technical matters, whereas general cadre for overall matters. It is usually found that general cadre always represents the majority of developments and playing a role in different ministries as policymakers and supervisors. A regular of the general cadre among various departments is a tradition in public administration which generally reduces the institutional capacity of the bureaucrats for tackling policy-related problems (Khan and Rahman 2007). The general cadre is dominant and more politically powerful over special cadres. Division of BCS cadre's recruitment causes an imbalance of the power of the political system.

## Role of Bureaucracy on Disaster Management

Bureaucracy is considered as a key instrument of social change. Bureaucracy has an important role in dealing with global challenges. Climate change is considered as a key challenge of humanities irrespective of developed and developing countries (Rashid 2014). Most of the countries of the world emphasize a priority to mitigate the challenges of climate change. Climate change challenges can be solved by two ways like mitigation and adaptation. Mitigation is an appropriate measure to those countries which are responsible for greenhouse gas emission, whereas adaptation is a key tool for those countries which are victims of climate change (Sarker et al. 2019). However, the issues of mitigation and adaptation are getting priority in public policy decisions. In some cases, policy measures may be good, but its effective implementation is necessary for getting proper results. Bureaucracy is the responsible organ of the government to make policy measures as well as implement it to field level. The main bureaucratic role in disaster management is to make policy and practices related to climate change mitigation, adaptation, and disaster management-related project (Bhuiyan 2015). A successful policy and project implementation require efficient bureaucratic intervention. Bureaucrats are the supervision of almost all disaster-related project for which they can contribute from policy formation to successful implementation. They are acting as an authority of regulatory body and finance.

## Challenges Regarding Disaster Management

### Tendency of Elitism

The bureaucracy of Bangladesh is highly characterized by an uneven distribution of power and a

large power distance. This uneven hierarchical power practice is developed from long ago due to societal root. This uneven practice now becomes a part of the administrative culture of Bangladesh (Mollah 2011). Due to a large distance between subordinate and supervisor, an elitist attitude grows in the administrative culture which made bureaucrats a superior and subsequently made people as inferior. Another origin of elitism is the British colonial administration which is also a root of current bureaucracy in Bangladesh. The elitist attitude is a challenge and burden to build a good relationship between citizen and bureaucrats.

## Centralization of Decision-Making

One of the major characteristics of the bureaucracy of Bangladesh is centralized decision-making which encourages bureaucrats to get a position in ministry at any cost. Disaster management policy and decisions are taken by the bureaucrats of the concerned ministry. The centralized decision is rarely successful due to ignorance of the decision-makers of the disaster context (Emdad and Salim 2013). The field-level administrations are not capable to take a decision and spend money on disaster management. Though local administration (upazila which is upper than village level) is the top authority for dealing all affairs of the upazila including disaster management but it suffers from funding crisis which makes them unable to response, local administration is waiting for decision of district and state level administrative decision and fund that is the most challenging situation for disaster management arising from cumbersome democracy (Khan 2013).

## Lack of Coordination

Nowadays the bureaucracy of Bangladesh is suffering from lack of coordination which reduces the efficiency of policy execution. Due to context-specific nature, disaster management requires effective coordination among the stakeholders like within the bureaucrats and between bureaucrats and others. A desirable output from any project can come when it is implemented properly. So, governance is a vital matter to tackle disaster-related initiatives. Governance can be ensured through managing coordination among all related stakeholders. It is found that several public agencies and private organizations work for disaster management during or after a disaster, but they have no connection to each other (Mollah 2011). So, they are doing repeated work due to lack of coordination. As a result, the outcome for disaster management cannot be achieved at a desirable level. This lack of coordination is a result of negative bureaucratic attitude, poor capacity and communication, non-response of the so-called disaster management committee, and poor information.

## Policy Recommendations

- Local adaptation strategies should be given priority for context-specific disaster management and included in the disaster policy decisions.
- Coordination among public and private actors should be enhanced for better prevention of any response and recovery activities.
- The capacity of the actors of disaster management agencies should be strengthened through enhancing knowledge and skill of natural, sub-national, and local actors and included modern toolkit like GIS (Geographic Information System) for specific and accurate information.
- Disaster management training should be given to all related stakeholders like bureaucrats, local administrators, extension agents, NGO workers, and local leaders for disaster prevention, timely response, and quick recovery.
- A network should be developed among government actors, NGOs, journalist, academicians, and other professionals and focus their vital roles as well as contributions for solving the problems related to mitigation and adaptation of natural disasters. All level of disaster management committees should be activated for strengthening the capacity of monitoring and evaluation, decentralization of decision-making, and a better integration and coordination from local to national level.

## Conclusion

Bangladesh is susceptible to natural disasters due to its geographical deltaic position. Bangladesh has already taken some mentionable initiatives for disaster management, but due to poor network governance, the outcome is not up to expectations. Though policy documents are well enough focusing governance system, capacity building, resource utilization, and political will, the implementation are characterized by unwillingness, corruption, and red tapism. Proper disaster management requires national policies as well as effective implementation. Bureaucratic practices of Bangladesh for general cases are similar to disaster management, so the dominance of a general administrative cadre for technical matters of disaster management is not effective always. The lack of knowledge and skill, corruption and weak monitoring, and evaluation of bureaucrats cause a large failure of the climate change and disaster-related project. The main challenges of bureaucracy for disaster management are elitisms, the politicization of bureaucracy, large power gap, bureaucratic superiority attitude, poor financial authority, and malfunction action's network. A special task force is necessary for effective disaster management from local to national level which will be equipped by knowledgeable and skilled bureaucrats, context-specific policy and actions, coordinating attitudes, modern technical tools, and willingness to work with local people.

# Bureaucracy Responsiveness

Yuguo Liao
University of Missouri-St. Louis, St. Louis, MO, USA

## Synonyms

Bureaucratic responsiveness; Public responsiveness

## Definition

Bureaucracy responsiveness, or public responsiveness, refers to the extent that administrators can track public interests in a timely and accurate manner, providing the appropriate services accordingly.

## Introduction

Most theorists agree that bureaucracy responsiveness is a multi-facet concept because bureaucrats have to attend to multiple legal concerns in the pursuit of public interest. In other words, professional administrators need to maintain a balance among competing demands. Bryer (2007) identified six variants of bureaucracy responsiveness in contemporary democracy: dictated responsiveness to elected officials, constrained responsiveness to bureaucratic rules and norms, purposive responsiveness to professional goals, entrepreneurial responsiveness to customers of government, deliberative responsiveness to the public as partners or collaborators with administrators, and negotiated responsiveness to balancing potentially competing demands. Through a values perspective, Nalbandian (1991) argued that public professionals in local government should act based on the values of efficiency, representation, social equity, and individual rights. Similarly, Denhardt and Denhardt (2007) noted that public administrators should be held accountable to a constellation of competing values and norms, including the public interest, statutory and constitutional law, other agencies, other levels of government, the media, professional standards, community values and standards, situational factors, and demographic norms and citizens.

Bureaucracy responsiveness is important because of the changing role of bureaucracy which calls for a more direct connection between professional administrators and citizens. It is also crucial for enhancing citizens' political efficacy and fostering an active citizenry.

The ultimate purpose of bureaucracy responsiveness is to ensure that bureaucratic actions reflect the public desires, ultimately, reconciling the possible conflict between bureaucratic values and democratic ideals.

## Three Major Approaches to Achieve Bureaucracy Responsiveness

The ways to achieve bureaucracy responsiveness have been discussed from different perspectives. These approaches differ with each other in terms of how public interest should be defined and sought and the role of bureaucrats in pursuing public responsiveness. The current literature provides three major approaches to achieve bureaucracy responsiveness, namely, the "citizen-get-what-they-want" approach, the "dare-to-say-no" approach, and the "let's-work-together" approach. The previous two – the "citizen-get-what-they-want" approach and the "dare-to-say-no" approach – can be viewed as opposing poles along a continuum. Both of them believe that there should be a dominant preference guiding the bureaucratic action. The third perspective, or the "let's-work-together" approach, suggests that there should be no predetermined preferences. Bureaucrats need to bring affected stakeholders together and hold discussions and deliberations to discover the best solutions.

### "Citizen-Get-What-They-Want"

The first approach is citizen-centered, which argues that public administrators should faithfully carry out citizen demands. Schumaker (1975, p. 494) argues that responsiveness is "the relationship between the manifest or explicitly articulated

demands of a protest group and the corresponding actions of the political system which is the target of the protest-group demands." Rourke (1969, p. 3) notes that a responsive system is the one that "promotes a correspondence between the decisions of bureaucrats and the preferences of the community or the office-holders who presume to speak for the public." Similarly, Fried (1976, p. 15) suggests that bureaucracy responsiveness refers to "the congruence between the goals the organization or administrative system pursues and the goals desired by the people to whom the organization is responsible and under whose authority it operates." According to this "citizen-get-what-they-want" perspective, only the outcome that citizen demands cause, at least in part, changes in policy outputs could be considered as responsive.

In practice, this approach emphasizes the conformity of bureaucrats with citizens and their legal representatives. A typical example would be the conventional council-manager form of local government. As an application of the political-administration dichotomy in local government, this form of government separates the city manager from politics and policy-making. The city manager is expected to neutrally carry out the policies made by the governing body. City managers are purposefully isolated from directly interacting with citizens, and it is the elected officials' responsibility to sense the demand of the public. The way to achieve bureaucracy responsiveness is to ensure city managers respond to their political superiors.

### "Dare-to-Say-No"

The second approach believes that the best way to achieve bureaucracy responsiveness is to deploy the professional expertise and specialized knowledge. The underlying assumption is that citizens are unrealistic, impractical, individual-centered, and short-termed (Bozeman 2007). Citizen opinions may just reflect their opinions. A simple congruence between bureaucratic actions and the stated public demands, as suggested by the "citizen-get-what-they-want" approach, should not be the ideal way to achieve bureaucracy responsiveness.

Rather, this approach emphasizes that the achievement of bureaucracy responsiveness relies on professional administrators' use of the scientific methods to seek out the long-term and holistic interest. As Landy (1993, p. 25) suggested, administrators "have the prime responsibility for teasing out the essential social and ethical issues at stake from the welter of scientific data and legal formalisms in which those issues are enveloped."

Administrators are encouraged to reach out to citizens, learn from citizens, and listen to their concerns. But administrators also reserve the flexibility to mold citizen preferences if necessary. For certain policy issues, administrators also assume a responsibility to educate citizens and help them understand the complexity of public policies. Box (1992, p. 327) noted that bureaucratic actions to achieve bureaucracy responsiveness should include "advocacy of a new policy direction in dealing with the council; taking a strong and inflexible stand on an issue, contrary to the expressed wishes of the council; using the normative view to shape daily decision; using the normative view to shape research documents and projects which will result in policy or procedure recommendations to the council; and working with community groups to assist them in organizing and articulating their views." In sum, this approach believes that it would be acceptable if the policy outcome may not exactly mirror what citizens want. For administrators, they do not have to change "no" to "yes" if there was a good reason to say "no."

### "Let's-Work-Together"

The third approach seeks to integrate the previous two approaches and acknowledges that both citizen demands and professional expertise are critical. It is process-based approach which argues that the pursuit of bureaucratic responsiveness lies in deliberative and learning interactions between professional administrators and all affected stakeholders.

This approach believes that bureaucrats should not simply be subordinates to their political superiors or professional experts who act according to specialized knowledge. Rather, they should be

spokespersons for the community who directly interact with citizens. Administrators will function as "facilitators, educators, and coparticipants, rather than deference-demanding experts or independently responsible decision makers" (Adams et al. 1990, pp. 235–236). Seeking bureaucracy responsiveness should be grounded in a process characterized by two-way communication, such as public discussion, dialogue, and deliberation. For example, public deliberation is defined as "debate and discussion aimed at producing reasonable, well informed opinions in which participants are willing to revise preferences in light of discussion, new information, and claims made by fellow participants" (Chambers 2003, p. 309). Typical deliberation activities include "a careful examination of a problem or issue, the identification of possible solutions, the establishment or reaffirmation of evaluative criteria, and the use of these criteria in identifying an optimal solution" (Gastil 2000, p. 22).

Such two-way communication facilitates the mutual understanding between public professionals and citizens. Through interactive communication, professional administrators will recognize the value of public expertise. They will be more willing to share their knowledge and expertise with citizens. They will also realize that increased citizen involvement is not necessarily threatening but could be beneficial to the quality of policy. Stivers (1994) argues that bureaucracy responsiveness starts with skillful listening. Skillful listening requires administrators to be humble and seek diverse viewpoints: "[D]ialogue marked by skilled listening creates a shared reality, a public or common space that promotes responsiveness and a sense of mutual obligation or commitment" (Stivers 1994, p. 366). "Listening. . .helps administrators glean important information, define situation more carefully, hear neglected aspects and interests, and facilitate just and prudent action in often turbulent environment. Listening offers the possibility for a real "reinvention" of agency policy and management process" (Stivers 1994, p. 368).

Two-way communication also offers learning opportunities for citizens. Public dialogue and deliberation enable citizens to listen to the views of others, to sharpen their intellectual and cognitive skills, to think of alternatives, and to broaden their own views. As Bozeman (2007, p. 110) observed, "deliberation within the method of democratic social inquiry can promote the discovery of new courses of action and reveal underlying shared interested that may not be immediately obvious in light of the previously stated proposals and positions."

This approach seeks to achieve bureaucracy responsiveness not by simply imposing individual preferences or professional expertise. Administrators need to balance multiple competing demands through cooperation and deliberation. The designated "response" to a given policy question will be generated through public discussion. Denhardt and Denhardt (2007, p. 84) summarizes this approach as follows: "[W]hereas traditionally government has responded to needs by saying, 'yes, we can provide that service' or 'no, we can't' . . .public administrators should respond to the requests of citizens not just by saying yes or no, but by saying such things as 'Let's work together to figure out what we're going to do, then make it happen.'"

In sum, the methods to achieve bureaucracy responsiveness vary in the guiding principles that bureaucrats use to strike a balance among competing demands. The "citizen-get-what-they-want" approach emphasizes that the action of public administrators should faithfully follow the citizen demands, whereas the "dare-to-say-no" approach emphasizes advancing public interest using the scientific knowledge and objective criteria. Unlike the previous two methods, the "let's-work-together" approach believes that bureaucratic response should not be predetermined. Rather, bureaucratic response should be formed through a cooperative and deliberative process.

## Factors Associated with Bureaucracy Responsiveness

There are multiple groups of factors that are associated with the level of bureaucracy responsiveness.

### Organizational Factors

Organizational factors are widely discussed in bureaucracy responsiveness literature (Alkadry 2003). Organizational structures and rules have the potential to impact administrators' responsive behavior. The degree of organizational centralization and formality can impact organizations' responsiveness to citizen demands. Highly centralized power and authority are likely to lessen administrators' ability to respond to changes of environment and citizen preferences. Alkadry (2003) reported that the empowerment of frontline employees will increase their responsiveness to citizens.

The design of administrative procedures is another structural factor that influences administrators' responsive behavior. Manring (1994) suggested that the workload and reward structure can determine the time and negotiation efforts administrators devoted to responsive management. Jones et al. (1977) pointed out that operational procedures can be developed by the bureaucracy to determine its response to citizen contacting. Vedlitz and Dyer (1984) found out the amount of service request from a particular area is less likely to facilitate or delay bureaucratic response to those services. How organizational rules are designed, in other words, whether the public satisfaction is taken into consideration when developing the rules, holds the key. Mladenka (1981) noted that citizen complaints can't receive favorable response if they are processed in overwhelmingly standard and technical-embedded procedures.

### Political Control

Elected officials are the legitimate representatives of citizens. They assume the formal responsibility to discern and pursue the true interest of all citizens. Thus, elected officials need to provide political guidance to bureaucrats to ensure that bureaucracy and democratic governance are compatible.

Another reason why political control is crucial for bureaucracy responsiveness is that political superiors can determine how much resource the bureaucracy can get. Responding to the public demands requires financial and human resources. Elected officials have the power to increase, decrease, or maintain the level of resources that the bureaucracy can obtain, which also signals elected officials' preferences.

Two approaches of political control over bureaucracy could exist: ex ante administrative procedures and ex post oversight. Typical ex post oversight actions include monitor, reward, or sanction efforts, such as reducing public agency's budget. On the other hand, elected officials can use ex ante control, such as administrative processes and direct orders, to enhance bureaucracy responsiveness. For example, Chaney and Saltzstein (1998) found that directive orders in the form of mandatory arrest laws, particularly city laws, are strongly linked with municipal police officers' use of arrest as a response to domestic violence. The ultimate purpose of ex ante control is to ensure that administrators obey and enforce the decisions, rules, and regulations of elected officials.

However, it should be noted that political control is necessary but not sufficient to ensure bureaucracy responsiveness. Not all elected officials are sensitive to citizen demands. At the local government level, elected officials who are elected at large, in part-time position, and without secretarial support can poorly represent their constituencies (Mladenka 1981). Citizens may not be able to be fully represented solely by officials they elect.

### Policy Clients

Pressures from policy clients could compel bureaucrats to respond to their demands. However, various client groups pose different levels of political capital to influence governmental officials. Citizens or citizen groups with higher socioeconomic status are more likely to participate in public affairs. Accordingly, they are more likely to receive responsiveness from bureaucrats. Jones et al. (1977) observed that citizen contacts from high-income and white-majority neighborhoods receive quicker response than those from lower-income neighborhoods.

The presence of organized opposition can also impact professional's decisions. Additionally, bureaucrats are more likely to respond to and

establish long-term partnership with citizens who are interested and knowledgeable about relevant policy issues. Berner (2001) conducted a survey conducted in North Carolina municipalities and found out that about 43% of city managers cited citizen interest as an important motivator for their extra efforts to involve citizens in local budgetary process.

### Bureaucratic Values and Intentions

Even with the existence of organizational enablers and political pressures, administrators still have the discretion with respect to how they will react. First, bureaucrats' discretion may enhance or impede the effect of political control. Political control could be minimized by administrators who are skillful in coping with the political complexities and shaping policy priorities. This also applies to organizational factors. Government organizations with similar structures may have different performance outcomes depending on the individuals who operate them. Alkadry (2003) noticed that "the removal of structural constraints would not by itself enhance the responsiveness of administrators. Empowering employees. . .within the organization would result in empowered employees who (still) have personal constraints to being responsive" (Alkadry 2003, p. 206–207). Such leeway reflected the importance of bureaucratic mindset and intention in facilitating administrative responsiveness.

Bureaucrats' values and intentions mediate the organizational and environmental factors and their level of responsiveness. Given the discretion that administrators have in interpreting information originated from the environment and organization, how administrators view the value of being responsive, and how much effort they are willing to exert will play a facilitating or constraining role in the pursuit of bureaucracy responsiveness. Bureaucratic values and intentions are important to the level of bureaucracy responsiveness; they are also important for how bureaucracy responsiveness will be achieved. Without truly embracing the value, responding to public demands can be conducted in an elite or authoritarian way.

### Task Difficulty

The content of the requested service is associated with the level of bureaucracy responsiveness. Services that require considerable amount of resource may receive a low level of favorable responsiveness (Mladenka 1981). For example, a negative relationship can exist between service requests from disadvantaged groups of citizens and bureaucratic responsiveness since such requests tend to be difficult to achieve. Fossett and Thompson (2006) noticed that the establishment of client-friendly Medicaid and the enrollment process of State Children's Health Insurance Program need additional fiscal and political investment. Consequently, states with a high percentage of uninsured children are less likely to prioritize such enrollment.

## Conclusion

Bureaucracy responsiveness is different from political responsiveness and business responsiveness. Political responsiveness deals with the relationship between public administrators and their political superiors. Business responsiveness is primarily interested in understanding and tracking customer needs and market trends. However, bureaucracy responsiveness examines the relationship between public administration and citizens by taking the role of bureaucracy into consideration. This concept represents understandings on how administrators should define, safeguard, and advance public interest.

# Bureaucracy, Bureaucratic Politics, and Democracy

Ali Farazmand
Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Bureaucratic politics; Democratic politics; Governance; Government; Group politics; Partisan politics; Policy politics; Program; Public administration; Representative bureaucracy; System maintenance

## Definition

Bureaucracy: an organization system of order, functional specialization, and formal rules and operating procedures aimed at accomplishing goals; stands for order and stability, institutional continuity, and organizational values of efficiency, effectiveness, and fairness.

Democracy: a political system of governance and government based on fair representations through elections, institutional checks and balances, and democratic values of responsiveness, responsibility, and representation.

## Introduction

Bureaucracy has proven to be one of the oldest, most resilient, and most enduring institutions in history. As the most powerful instrument of government and governance, it has survived millennia of political and social changes, revolutions, and upheavals from the dawn of civilizations to the present. Political masters have come and gone, but none has been able to do away with bureaucracy. In contrast, democracy does not have a long history, except for some sporadic practices in primitive forms and scale in ancient Greece, as fantasized in the West. What do bureaucracy and democracy really mean? Are they compatible or contradictory? What do bureaucratic and

democratic politics mean? And by the same token, what does bureaucratization and democratization mean? What perspectives can possibly explain these two institutional phenomena, particularly in the age of globalization? Answering these questions fully and comprehensively is an elephantine task, like managing a huge empire. This short entry addresses these important questions succinctly. A full version of this entry is found in Farazmand (2010).

## Visiting the Empire

### Perspectives on Bureaucracy and Bureaucratic Theory

Borrowing Herbert Simon's metaphor on decision making (Simon 1979), a visit to the colonies of the empire of bureaucracy is made in search for its eminent limestones. A whole density of population is discovered that comprises perspectives, studies, and practices that can hardly be missed by anyone on the planet where human species live – even the most free and wildest animals cannot escape it. While the population of studies and perspectives as well as writers and speakers spread all over the social sciences, the density seems to be focused in sociology, economics, political science, public administration, and organization theory – oh yes, history and civilization too. The inhabitants include liberals, conservatives, advocates, opponents, and neutral observers from all disciplines and walks of life, classical, neoclassical, institutionalists, and revolutionaries. Visiting the colonies makes one wonder how the empire started, who the pioneers were, who mastered the beast, who perfected it, and why has it become so hated as well as loved. Volumes of books and articles may not be enough to answer these questions, much less this short synoptic entry. This empire is visited without surveying its many colonies– a task beyond this limited space.

Bureaucracy has gained a pejorative reputation over time and has often been associated with red tape, delay, corruption, and stifling processes in getting things done. It has also gained a negative reputation for being a repressive instrument of domination, control, and class rule in the hands of ruling elites. But bureaucracy and bureaucratization have also been historically recognized for providing institutional processes through which benefits to large mass society can be provided for various reasons. This has been shown by historical evidence (Antonio 1979; Eisenstadt 1963, 1993; Farazmand 2009b, c, 2010) or standardization and efficient administration of colonial territories by modern empires (Farazmand 2009b).

Two perspectives explain the meanings of bureaucracy. One is the Weberian ideal-type concept of bureaucracy as the most efficient type of organization based on formal, merit, and rational characteristics. In reality, an ideal-type bureaucracy rarely exists – approximation or a combination of merit and patronage is what really operates. Exceptions aside, some societies are better organized along Weberian lines, while others still dwell in early colonies.

Weber's coinage of bureaucracy also offers a "comparative" approach if not methodology of studying modern organization and administration. Many inhabitants of the bureaucratic colonies have missed this key feature of Weber's idealization managing large-scale organizations and societies. Why? Has there been a shortage of inhabitants interested in such studies? Hardly so, and the answer seems to be more of preoccupation with other features of bureaucracy for obtaining political control, organizational efficiency, and managerial effectiveness in administration. This colony of "comparative studies" is underpopulated and is in need of scholarly works, particularly in the age of globalization of corporate capitalism and of global empire building.

The second meaning of bureaucracy refers to any large organization or institution organized with structure, process, and normative values, rules, and regulations as well as a mix of merit and patronage and record systems. Waldo (1947, 1992), Eisenstadt (1963), and others, including this writer (Farazmand 2009b, 2010), are known for espousing this view. A handful of historical bureaucratic empires, such as the ancient world-state Achaemenid Empire of Persia, Imperial Rome, the British Empire in India, the Prussian/German and French empires both at home and in

colonies, as well as the American bureaucracy, resemble a high degree of professionalization close to Weberian bureaucratic model. The former Soviet Union bureaucracy – huge on a world scale – was claimed to be meritorious and professionalized, but studies are needed to reveal details worthy of scholarly research consideration. Such studies need to be conducted free from ideological and political biases. Bureaucracy has survived 8000 years of political and social changes and upheavals in the Near/Middle East, particularly early Iran and Persia, Egypt, India, Assyria, and Babylon (Olmstead 1948; Farazmand 2001, 2009c, 2010). As a concept or organization, bureaucracy is the most powerful institution of governance and administration in both government and business enterprise. It is an organizational system no one can escape (Marx 1967; Weber 1947).

### Bureaucratic Politics and Democratic Theory

In another study, Farazmand has (1989b) identified several types of politics: group politics, partisan politics, program and policy politics, and bureaucratic politics. While each of these political types serves particular interests or purposes, bureaucratic politics serves as a "key instrument" in accomplishing or achieving the goals of all other politics. It is the bureaucracy – both civilian and military – that is the institutional arm or machinery of government, one that carries out policies and programs and accomplishes political goals. This raises the central questions of who the bureaucracy serves, who controls it, and how this works as a process. These are fundamental questions that social scientists, revolutionary leaders, and administrators have tackled for millennia.

Can bureaucracy be neutral? Perspectives abound, but the majority agrees that whoever controls the institutions of government also controls and uses the bureaucracy as an instrument of power and rule – including class rule. Highly influenced by Karl Marx (1967), Max Weber (1947) agreed that ideal bureaucracy rarely exists or operates and has a tendency to "overtower" society (1984) and that bureaucracy is a "powerful instrument of power of the first order" in the hands of those who control it – whether a monarch, an elected president, or autocratic dictator (Weber 1947), as it was in the imperial Rome (Antonio 1979) or the last stage of the Persian Empire (Eisenstadt 1963; Farazmand 2009c).

Several perspectives may explain bureaucratic politics in a broader sense. It means internal organizational politics of bureaucracy by those in key positions favoring particular policies, programs, and or ideas. It also means playing with bureaucratic rules to slow down or expedite certain ideas and programs through policy "implementation." The psychological impacts of bureaucracy on individual citizens and employees working are enormous and documented by psychologists and anthropologists, with huge implications for public administration, public policy, and governance.

The role of bureaucracy in society, therefore, is manifested through policy implementation, role clarification, class rule, regulatory function, development, destruction, and political system maintenance or enhancement (Farazmand 1989a). Neoconservative and neoclassical economic theorists of the "public choice" theory circles have written a lot on the antidemocratic side of bureaucracy, while others have done equal critique of the beast that stifles quality of life and represses humanity and environment. They prescribe "privatization and corporatization" to maximize citizens' self-interest individualism. These critics rarely speak of military bureaucracy. Bureaucracy is a powerful instrument of system maintenance, and all bureaucracies perform this function; it becomes a powerful "instrument of class rule" by those who rule society, whether a capitalist ruling class (ala Karl Marx 1967; Lenin 1971), a few rich oligarchs and "ruling power elite" (Parenti 1988, 2010), or any person – whether a dictator, a monarch, an elected president, or a council (Weber 1947).

While most developing countries experienced direct colonial rule of Western empires, with the exception of Iran or Persia and Turkey (former Ottoman), which were empires themselves right into the twentieth century, and Thailand. Post-World War II "political" independence has meant little but a continuation of bureaucratic and economic rule by remote control and through a new class of "comprador bourgeoisie" to borrow from

Lenin (Lenin 1971). The new class of military and civilian bureaucratic elites are the actual "agents of the neocolonial rule," agents acting in harmony with the interests of foreign imperialism. Escaping the global empire's grip is not easy, as most developing nations need foreign aid often coming from the West, but none comes without conditions that bind them with neocolonial grip over their lives and governance systems (Amsden 2007).

The third perspective on bureaucratic politics is explained by "bureaucratism," a process and phenomenon that involves use and abuse of power and authority by bureaucrats in positions of power for personal and political purposes. Creating a dynamic that can also be purely for personal gain (see Farazmand 1989a). The fourth explanation of bureaucratic politics is summed up in the "bureaucratization" process and phenomenon, an issue beyond the scope of this short entry; bureaucratization is both political to curtail decentralization and autonomous power centers or structures – such as feudal lords – in favor of more concentrated power structures by kings, elected presidents, or other officials. It is also a "social or class leveling" practice to break the class hierarchy and spread access to government and its privileges of society among "common citizens." Historical evidence shows this to be the case in ancient Persia and Rome and contemporary United States.

Finally, bureaucracy and change or revolution is another huge topic that requires separate treatment (see, e.g., Farazmand 2009c, especially Chaps. 32–35). Three theoretical perspectives inform this relationship: One is the "neutrality" of bureaucracy, Wilson's view, or at least one attributed to him (Wilson 1887); the second as an opposite view sees bureaucracy politically involved at all levels with all social and normative values and rejects the neutrality doctrine in governance and administration. Dwight Waldo and Robert Dahl made this point since the late 1940s, a view I also concur with (Farazmand 2010). The third view on bureaucracy is espoused by Marx, Lenin, and revolutionary leaders and sees it a dangerously powerful obstacle to revolutionary change. It must be changed or replaced, but two different viewpoints have emerged within this revolutionary perspective: one for abolishing the bureaucracy of the old regime immediately, while the other arguing in favor of its "gradual change" and replacement. Lenin (1971) prevailed in the great debate right after the Bolshevik Socialist Revolution of Russia in 1917. Similar patterns developed after the Iranian Revolution of 1978–1979 (Farazmand 1989a) – The author supports this view of bureaucracy as well.

## Democracy and Democratic Politics

Like the colonies of bureaucracy, the colony of democracy has also been inhabited by many from all disciplines that include idealists, realists, conservatives, liberals, democrats, and revolutionaries, both secular and religious. The empire has many colonies, and all contend superior qualities, and none seems to acknowledge diversity as a quality for coexistence. So, the "colonies" grow, and the search for absolute truth continues in a march through the age of rapid globalization in which the more dominant "colonies" claim ownership, control, and monopoly of ideas, ideals, and features of the empire.

From the dawn of human civilizations, rulers, philosophers, and thinkers have tried to create ideal societies. Ancient Greek philosopher Plato conceived an ideal state in his *Republic*; the Persian philosopher of the tenth century Farabi, also known as the Second Teacher in history after Aristotle, developed the "ideal city state" in his book, *Madineh Fazele;* and Western philosophers like Locke, Hobbs, Rousseau, Montesquieu, Bentham, Mill, and the American Founding Fathers also proposed forms or models of government. The latter tried to prescribe institutions and systems of government to promote equality, rule of law, liberty, collective mechanism, separation of powers, constitutional rule, and other forms of citizen participation in government and administration. So did the revolutionary leaders of the Russian Bolshevik Revolution by visioning a classless society under communism. Similarly, the postrevolutionary Iran tries to create an "ideal society" based on social and economic justice and through a mix of presidential and parliamentary systems of government, direct popular election, and Islamic sanctions. All strove to

create an "ideal society and governance." Yet, neither ideal society nor true democracy has emerged anywhere as a political system in the world as of yet.

Democracy is an illusory term in need of extensive definitions, explanations, and interpretations, a task beyond the space limitation of this short entry. First, all democratic theories imply, explicitly or implicitly, a number of characteristics common to all democratic systems of societies – such as the role of the constitution, rule of law, respect for minority rights, elections and other forms of representation, citizen participation in political activities, accountability, and responsiveness; most of these characteristics rarely exist in any democracy, but a degree of their presence or practice may be found in various societies or political systems. Second, variations among democracies abound, as political cultures and traditions play key intervening variables. Third, pure or ideal democracy does not exist, or is at best rare. Fourth, the larger the society and more complex its sociocultural and political orientations are, the more complex and less democratic that democracy tends to become. Fifth, the more technologically advanced, the less democratic and more bureaucratic the society tends to become, as specialized knowledge and technical expertise are not comprehensible to average citizens. Finally, there are officially known democracies that have no constitutions and practice undemocratic activities, and their people are treated as "subjects of monarchs or queens, not 'citizens,'" hence a contradiction in democratic theory in practice because subjects can determine their destiny. Finally, there are also "exclusionary-," racially, or religious-based political systems that are officially known as democracies but actually practice exclusion of people based on religion, race and ethnicity, culture, or color – they even practice apartheid systems.

Theories of democracy also abound: group theory, pluralist theory, populist theory, elite theory, market theory, and socialist theory. Using a continuum on democratic theories, three perspectives emerge: On the far right, conservatives are found under various names (US Republicans, British Conservative Party), on the far left are socialists and revolutionaries (Cuba, USSR, Mao's China), and in the middle is a spectrum of so-called names and tendencies (Democrats or liberals in the USA or Europe), all with values in Western political culture composed of individualism, property, liberty, and equality, with the exclusion in practice of certain people of color, gender, race, etc., as history has shown in Europe, United States, and Australia, some as late as the 1960s – Native Americans and Blacks as well as women in the United States – the latter gained voting rights early in the twentieth century.

The dynamics of democracy are further explained by the variations in forms of political systems and degrees of citizen participation in the political process. Generally speaking, the three types of democratic political systems which use election as a rule are the parliamentary system (e.g., Germany, India), the presidential system (e.g., US system), and the mixed parliamentary and strong presidential system (e.g., France, Iran). Socialist systems may also have elections, both directly and indirectly through representation, but direct democracy is rare and possible only in small population-based towns or villages, hence the case for "representative democracies," in which citizens have to rely on elected representatives who tend to "logroll" through give-and-take strategies with opposing colleagues in order to get things done, and this adds more complexity to the politics of democracy.

The politics of democracy are explained by several perspectives. One on the far right complains against bureaucracy and big government; another perspective sees democracy deficient as a form of government. Plato considered democracy deficient and based on the "rule of the mob," with human sentiment playing a key role in determining who should rule, subject to manipulation by money and personality power. To Plato, democracy means "plutocracy" or rule by the rich.

Contemporary critics of democracy also point out the power of money and wealth, not formal elections or official names, to rule; they consider "plutocracy" as the norm of governance in bourgeoisie democracy, with a few rich who dominate the vast majority of the "powerless" (Parenti 1988, 2010). The third view comes from the left,

the socialists and revolutionary progressives who see democracy in capitalism a rhetorical cover for class exploitation and repression of the vast majority of people by the few super rich capitalist class. This group of critics also notes contradictions between what the Western democracies claim through rhetorical slogans and what they actually practice in other nations around the world – ignoring human rights and violating democratic values in favor of national economic or business interests. This perspective criticizes industrial democracies for practicing neocolonial and imperialist ideas, invading rich developing nations for political and economic reasons and dominating the world by forming an oligarchic hegemony (Parenti 1988, 2010; Agnew 2005).

## Conclusion: Reconciling Bureaucracy and Democracy?

### Conclusion

Can bureaucracy and democracy be reconciled? Are they mutually exclusive institutions of modern governance? Bureaucracy stands for continuity, order, efficiency, standardization, and rationalization of government administration. It stands for fairness through universal application of rules and regulation, and as such bureaucracy is compatible with and serves the interests and goals of democracy. Democracy stands for election, representation, responsiveness, expediency, accountability, and citizen participation in the democratic process of government. Yet democracy has been less efficient, often eclipsed by corruption and other problems. The world of the last quarter century has experienced massive reforms in governments and administrative systems, all toward privatization and outsourcing of government functions. The major trends have been "market reform," market-based governance, market-based administration, strategic and systemic privatization, and results-oriented reorganization. The buzz word has been "new" to describe New Governance, New Public Management, and all the rest. How new are these "new" ideas? Just like the "colonies" of bureaucracy and democracy, the "colony" of reconciling bureaucracy and democracy – or bureaucracy-democracy relationship – is also heavily populated with diverse inhabitants, from left to right and from all disciplines.

Proponents of these new market-based reforms claim bureaucracy as a threat to democracy (Mosher 1968) and offer "reinventing government" through privatization and outsourcing of public sector functions (Osborne and Gaebler 1992). Opponents defend bureaucracy as better and more efficient when taking social and opportunity costs into account in the calculus of efficiency (Goodsell 2004; Farazmand 2009b; Meier 1993). They are critical of the corporate globalization of the world with loss of public accountability, abuse, and exploitation of human lives. They see the trend benefiting corporate globalizers and threatening "democracy" and democratic rights of citizens (Farazmand 1999; Korten 2001; Waldo 1992).

To these critics, it is a "hypocrisy" to speak of democracy without a competent and yet accountable and truly representative bureaucracy, because the two are interdependent and one in need of the other. This was the view of Dwight Waldo, and this is the view of this author (Farazmand 2010). In this line of interdependence, some authors have gone even further by calling bureaucracy as the "fourth branch" of government (Meier and Bohthe 2007). History has shown that bureaucracy persists, and those who claimed to abolish it have actually enlarged and empowered it. To abolish it, one would have to abolish/dismantle the US Department of Defense and the Pentagon which is the world's largest bureaucracy, and the same must be done in all other governments – and that is beyond comprehension. The political dilemma of democracy and bureaucracy has always confronted politicians and scholars with major choices to make – dismantling bureaucracy means chaos and disorder, and dismantling democracy means rule by bureaucratic officialdom. A balance must be maintained between the two, as there is no other alternative. As noted earlier, not all democracies are good or effective, especially in the age of corporate globalization in which corporate economic interests dominate democratic rights globally.

As argued elsewhere (see Farazmand 2002), both the policy of sweeping privatization and blind application of the new public management (NPM) are strategic instruments used to achieve the twin goals of corporate globalization of the world. The first transfers public sector functions and resources to the corporate sector, driving more millions of average people in a race to the bottom, while the second (NPM) changes the "culture" and basic assumptions of public service and public interests served by sound public administration systems with strong bureaucracies. More privatization means more dismantlement of democracy and its institutional systems (Farazmand 2002). Bureaucracy can also be democratized by increasing citizen participation, community-based administrative practices, and other mechanisms, such as "representative bureaucracy" (Farazmand 2009, 2010).

Are democracy and bureaucracy reconcilable? Yes they are. Are there contradictions in the relationship between the two phenomena? Yes there are, but they can be either minimized or aggravated depending on the public policies pursued. Extreme choices will result in imbalances and imbalance means accentuating contradictions. The current global stress on the political role of bureaucracies – including the private mercenary and corporate bureaucracies – for establishing domination, control, and hegemony is at the expense of creating social and economic opportunities for the masses of people in search of employment, decent living standards, and future well-being quality of life. Such an imbalance is dangerous to democracy and human rights with serious consequences for sound governance, democracy, public administration, and human life and environment.

The policy of excessive bureaucratization, militarization, and bureaucratic "domination" was detrimental to the ancient Persian and Roman Empires and contributed to their eventual downfall (Antonio 1979; Eisenstadt 1963, 1993); it is equally detrimental and dangerous to contemporary empires and political systems, whether democratic or authoritarian. Let us learn from history and its laws.

# Bureaucracy, Leadership, and Ethics as Reflected Through Movies

Dominick J. Spano
Dorothy F. Schmidt College of Arts and Letters, Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Bureaucracy; Business ethics; Company regulations; Corporate administration; Followers; Groupthink; Integrity; Leadership; Organizational management; Systems theory

## Definitions

Bureaucracy: A system which encompasses set rules and regulations; a management structure which often utilizes an organizational pyramid to allocate authority; a framework which is concerned with stability, order, and championing efficiency.

Leadership: A framework which focuses upon influencing followers in acting toward achieving a certain aim; a methodology of persuading others to yield to one's will; a fashion in which one convinces prospective followers to pursue what he or she believes to be the most auspicious fashion to complete any given task.

Business ethics: A set of business rules or regulations which involves doing what is optimal for clients per any given situation; conducting commerce in a moral fashion; upholding integrity to customers in the private or public sectors.

## Introduction

Movies often reflect the experiences of employees in modern organizations. Having worked in the private and public sectors, I can assert that the motion pictures *Modern Times* (1936) and *High Noon* (1952) were relevant to my experiences in these arenas. The themes of bureaucracy, leadership, and business ethics will be explored in said films and related to my tenure in the private sector at BB&T Bank.

## Bureaucracy

In *Modern Times*, Charlie Chaplin portrays an overworked factory assembly line employee. His working conditions are challenging. The assembly line moves too swiftly for Chaplin to produce efficient labor, his superior closely watches associates from his office via camera, and there are higher-ups standing over him while he works. The factory is decrepit, there are flies prevalent, and a colleague hits Chaplin in the face with a tool. The factory supervisor purchases a "feeding machine" for his subordinates to minimize their lunch periods. Chaplin is so dedicated to achieving at his job that he falls into the production machine, in an effort to keep up with the assembly line. His coworkers show little sympathy during these disturbing events.

These elements suggest that Chaplin's organization subscribes to bureaucratic theory. Said framework encompasses command chain

management, the hierarchy pyramid, and rules and guidelines to achieve a firm's major aim (Farazmand 2007, p. 26). There is a lucid command chain and organizational ladder in the establishment, with Chaplin's boss at the top. The associates who preside over the factory workers are likely directly under the boss, and Chaplin and his constituents are at the very bottom of the command chain. There are also various rules and regulations in the firm. Chaplin and the other assembly line workers each have a specific responsibility and must follow the exact procedures which are allocated to their roles.

Considering that bureaucracy is often closely associated with efficiency, management being concerned with how a firm executes production may fall under the umbrella of this concept. Chaplin's factory attempted to implement scientific management of organizational theory. Said framework focuses on internal efficiency maximization, work standardization, separation of supervisory from operational procedures, and the maintenance of efficient managerial control. It has been referred to as the "machine model" of organization (Farazmand 2007, p. 26). This firm did not garner the highest level of success via this model for a number of reasons. First, though the assembly line work was standardized, Chaplin was highly inept at his job. Chaplin struggled to keep up with his coworkers, and as a result, he ended up in the production machine. Despite showing Chaplin in this device per comedic effect, if this occurred in a modern setting, the employee would likely suffer injuries. Second, the "feeding machine" which was presented in the film may shorten the period that subordinates have for lunch, but any appliance of this nature would never be used by employees. If the manager of an organization even suggested this dining method to his staff, he would likely be served with labor union lawsuits. Third, the factory was presented as so disgusting that I would deem it as nearly impossible for an employee to conduct his duties in an efficient fashion. Finally, Chaplin is struck in the face with a sizable tool by one of his coworkers. Though in the film Chaplin sustained no injuries, in reality, he would require medical attention. Putting aside that the priority would be Chaplin's health, in respect to efficiency, having to disrupt an entire assembly line, losing hours of production time, rushing an employee to the hospital, and suffering legal woes are not preferred.

There were also bureaucratic elements prevalent in *High Noon*. Per an overview, the film starts with Marshal Kane's wedding to Amy Fowler. Unfortunately, they are unable to enjoy immediate marital bliss, as Frank Miller, a rogue which Kane helped to get incarcerated, is returning to town to enact his revenge. Kane attempted to get acquaintances to help him in his upcoming scuffle with Miller, but he was met with misgivings via joining this cause. This is jarring, as Kane was a fine man, who actually helped to purify the town. This element of the film personified a bureaucratic way of making decisions based on the perspectives of the townspeople. The citizens had uncertainties in assisting Kane not solely because Miller was a dangerous outlaw, but if Miller overtook Kane and anyone who dared to join his enterprise, it was possible that Miller would have claimed the town as his own, and this would prove disastrous for their livelihoods. I believe that the correct decision would have been for the townspeople to assist Kane, but said citizens made what they believed to be diplomatic choices, which were actually based on erroneous bureaucratic and selfish motivations.

Kane ultimately has the courage to square off against Miller and his associates alone. Though Kane put up a commendable fight against Miller and his colleagues, it became clear he would not be the victor without help. The gentle Fowler soon assisted her husband by shooting one of Miller's constituents named Pierce and giving Kane the latitude to overtake Miller. Fowler and Kane go off to live a happy life together. It was laudable that Fowler made the decision to assist her husband based on love and affection. It represented a truly selfless decision, which is not prevalent in most modern organizations.

The bureaucracy notated in both films is not dissimilar to modern firms. While working at BB&T, hierarchy, command chains, and rules and regulations were vital elements. Like in Chaplin's organization, BB&T branches were set up in a top-down fashion. The branch

organizational pyramid from top to bottom included the branch manager, senior banker, personal banker, and tellers. Branch managers and associates were not as empowered as most customers believed. For example, overdraft fees were restricted by a system that BB&T implemented which only allowed a client to receive a single fee back on an annual basis. This parallels the employees at Chaplin's firm, as the line workers had very little authority over the organization and their only obligation was to perform well in their duties. It was even discouraged for them to provide feedback to management. Though suggestions by lower-level employees to management were not always rejected at BB&T, they were seldom adopted.

In respect to the rules and regulations, BB&T harbored a system and a particular methodology for all client services. For example, upon opening an account for a client, I would greet the client, build rapport while learning what type of account would be a fit for his needs, make a recommendation related to said desires, proceed to open the account, insert his deposit into my teller draw following establishing the account, ask him if there was anything else I could do to provide top-tier service, and grant him many of my business cards and request referrals. BB&T's general procedures embodied systems theory, which is predominately concerned with stability and structure in all circumstances (Farazmand 2002, p. 80). The employees at Chaplin's factory utilized this framework, as the line worker duties were highly standardized. The town presented in *High Noon* encompassed general stores, saloons, and smaller retailers. The employees in such establishments also generally harbor static responsibilities within their positions.

## Leadership

The leadership within Chaplin's organization showed little to no consideration toward its associates. Most of its actions, such as spying on employees via secret cameras and attempting to abbreviate their lunch periods by using a "feeding machine," displayed highly adverse opinions and treatment to lower-level associates. Chaplin was hit directly in his face with a sizable tool and fell into the production machine. The appropriate actions of upper level professionals would be to show immediate concern for their employee, but Chaplin's management team offered him very low levels of consideration.

The leadership in *High Noon* included higher-ups in the town, such as the mayor, various administrators, and other political affiliates. Within the town, it was known that Miller made lethal threats against Kane, and it was his primary objective to cause Kane and his loved ones anguish. The political administrators of this town took no action to protect Kane from this imminent danger, and many of his affiliates refused to assist him. Their reasoning behind said actions was that they could have been exposed to acts of violence or it may have affected their livelihoods.

During my initial years at BB&T, I served under managers who created dreadful cultures, including harassment, false accusations, slender raises, and even being instructed to omit work hours so that the company avoided properly compensating employees. I was later promoted to the Manager of BB&T and can thus identify leadership frameworks which were favorable to the organization:

1. *The Ohio Leadership Studies, Initiating Structure*: This framework is more akin on setting standards, assigning roles, and pressing for production. This would be useful via BB&T's culture, as the goal was to produce the maximum revenue (Rainey 2014, p, 338). Though it is possible that employees in this environment may be intelligent and can provide serviceable feedback to managers, the general goal of subordinates was to do the work, collect a paycheck, and go home. This style was applicable for many of the associates at BB&T, but this company harbored select employees who were interested in achieving. Though I recommend that said associates are provided higher levels of individual consideration, this methodology overall aligns with BB&T's preferences.
2. *Fiedler's Contingency Theory of Leadership, Low Least-Preferred Coworker (LPC)*: This

encapsulates a more task-orientated leadership style (Rainey, p. 339). Similar to authority-obedience management, this framework is more concerned with accomplishing production tasks efficiently. Considering that most of the employees at BB&T were not intrinsically motivated, it was preferred to be direct in the tasks that they had to accomplish. However, there were again some associates who wished to achieve, so they deserved specific consideration.

These leadership styles can also be applicable to Chaplin's organization. The Ohio Leadership Studies can be related to Chaplin's production factory because the line workers are generally only concerned with finishing the workday. Though I would encourage management to keep an open mind in hearing suggestions from said subordinates, generally speaking this is the preferred methodology. Fiedler's Contingency Theory of Leadership, Low LPC is also suggested for implementation at Chaplin's institution. On any assembly line, it is important to complete tasks as efficiently as possible, as all of the roles are interconnected. Chaplin was inefficient in executing his duties, which slowed the production line down and ultimately led him to going into the factory production machine.

## Business Ethics and Morality

The management team at Chaplin's factory displayed little business ethics and morality. Their reprehensible actions were highly unethical and crossed many moral boundaries. In modern society, management would be sued or possible imprisoned for failing to inform employees that they are being watched or not immediately tending to an associate who was struck in the face with a tool during the workday. I feel that the town administrators from *High Noon* also failed to act in a moral fashion. These professionals were well aware that Kane was in grave danger and could have possibly been executed by Miller and actively avoided providing assistance. This is a theory in public administrations called municipal housekeeping which states that a city should be modeled after a home, as administrators must provide for citizens as a parent provides for children (Rissler and Shields 2019). The political higher-ups of Kane's town clearly did not subscribe to this concept via granting him safety.

Many of the actions at BB&T were also futile in upholding business ethics or morality. Per one illustration, employees were not allowed to work over the standard 40 hour week, as this organization had a strict policy on refraining from paying associates overtime. I remember one instance where there was a bank robbery toward the end of the day, and all employees were forced to stay 2 hours late to be interviewed by the police. BB&T initially refused to pay my subordinates overtime for their services. I called my supervisors and demanded that my workers be paid for their additional time. My team was properly compensated in their following paychecks. It was embarrassing that I had to make this call.

A second example at BB&T involved the concept of groupthink. I experienced groupthink during BB&T corporate board meetings. I can attest that groupthink is unpleasant and uncomfortable and should be unacceptable, but it happens regularly. In one particular meeting, BB&T's Supervisory Team called all of the managers to BB&T Florida headquarters. The primary reason for said meeting was that subsequent to the discontinuation of incentive-based compensation following the Wells Fargo scandal, the productivity of almost all personal bankers had substantially declined. BB&T supervisors ordered each branch manager to comment on whether he or she felt that BB&T should terminate the bottom 1/3 lowest-producing bankers. The first few managers agreed with this notion, and each subsequent manager concurred with this decision. Having being close with said managers and harboring many private discussions, I was aware that they did not subscribe to this course of action, as they felt that these lower-producing bankers were trainable and had potential. My colleagues failed to share these insights with BB&T supervisors, instead adhering to groupthink. I was the last manager to be asked about this decision, and the sole branch leader to tell BB&T supervisors that I did not agree with

this action course. I further noted that I used to work with many of these low-producing bankers and I believed in them. I put forth a persuasive case to BB&T supervisors about my feelings, and BB&T chose not to take this action. I instead volunteered to "train up" the lower tier of bankers, and almost all of them went from being in the bottom 1/3 to the top tier of production.

## Key Takeaways

There are a number of key takeaways which can be garnered from these films and my experiences:

1. *Subordinates are encouraged to present recommendations to management*: In most organizations, subordinates should present suggestions to management. For example, the results could have been positive if Chaplin had an open dialogue to his management team. There were many instances where I granted recommendations to my management team at BB&T, and my auspicious ideas were implemented.
2. *Management should listen to and consider employee insights*: Having served as a subordinate and upper management in many organizations, I believe that top-level executives and administrators should be open to viable suggestions from subordinates. There were many times in BB&T when my employees presented progressive ideas, such as when my lead teller articulated methods in which the teller line could have been streamlined for better efficiency. I considered all reasonable ideas and implemented those which were a boon to our branch.
3. *Exit an organization if the leadership and culture is adverse*: An experienced professional can determine in a timely manner if the leadership or culture of an enterprise is erroneous. Chaplin should have exited his factory earlier, but given the era and what was shown of his home life, it is likely that he needed the capital from this position. Similarly, I stayed employed at BB&T for over 5 years, and in retrospect it would have been advantageous to leave after a few years. I realized within a short period that it was a negative environment, but I choose to stay due to the pending fear that I would be unable to garner another position. This alarm was unwarranted, as I was ultimately recruited for a much more prestigious job shortly after leaving BB&T. Once ones surroundings are diagnosed to be unsuitable, adjustment must be conducted.
4. *All experiences contribute to personal development*: Though in the course of one's career path he or she will have many different experiences, each of them affects personal development. Chaplin grew as a result of his employment at the factory. The film ends on a positive note, with Chaplin securing employment in a different field and finding happiness with his love interest named Ellen. This implies that accepting that no matter what industry one serves there will always be hardships, but making the best of one's situation while obtaining joy from other areas of life is encouraged.

My tenure in BB&T helped me to grow as a professional and human being. It would be nearly impossible for all work experiences to be positive, but a great deal can still be learned from all professional occurrences. It is very possible that one may develop more from adversity. For example, I learned at BB&T that I can achieve greatness, even if nobody initially believed in me. If it was feasible for me to become BB&T's #1 banker and top manager for the majority of my tenure in this organization, then it is plausible for my readers to accomplish any realistic goal that they wish to reach.

## Conclusion

A great deal can be said for the value of viewing motion pictures as related to organizational theories. It is also encouraged to relate one's own experiences to various frameworks. *Modern Times* and *High Noon* certainly harbored elements which related to the aforementioned concepts. I recommend all interested parties to view these and further films and ponder how they correlate to

said subjects. By taking these actions, they will garner a greater understanding of these topics.

# Bureaucratic Accountability and Performance

Kwangseon Hwang
Department of Public Administration, Gachon University, Seongnam, Sujeong-gu, Republic of Korea

## Synonyms

Accountability; Answerability; Performance demands; Responsiveness

## Definition

*Accountability* is a social relationship in which an actor feels an obligation to explain and to justify his or her conducts to some significant other.

## Accountability Dimensions

A key definition of accountability is "a social relationship in which an actor feels an obligation to explain and to justify his or her conducts to some significant other" (Bovens 2010). Accountability can also be defined differently based upon social, political, cultural, and institutional conditions. In order to explain and to justify their conduct, public organizations release information about their actions to the public. Thus, accountability is often seen as "transparency" of information. This study follows the concept of accountability as managing and meeting public and other expectations for performance and for bureaucratic, legal, professional, and political responsiveness (Kearns 1996; Romzek and Dubnick 1987).

In addition to definitions of the concept, a variety of accountability frameworks for understanding accountability and its relationships has developed. The majority talks about a conflicting nature of accountability to which managers have to respond. The important implication is not *solving* the tension inherent in the need to address conflicting expectations but rather *managing* to "fulfill the public's expectations," which provides a more "realistic picture" of today's organizations and their environments. Romzek and Dubnick's model is useful as a framework for understanding and to measuring accountability reflecting this implication. Their four accountability schemes are:

1. Bureaucratic/hierarchical accountability, in which administrators' behavior is tightly controlled by superiors within an organization
2. Legal accountability, in which administrators' and agencies' behavior is closely controlled by legally empowered external principals, such as legislators
3. Professional accountability, in which technically expert administrators are expected to exercise considerable discretion, guided by shared professional norms and standards
4. Political accountability, in which administrators and agencies are expected to employ their judgment in responding directly to the expectations of the individuals or groups comprising the agency's political constituencies

Koppell's (2005) concept of accountability is also helpful. Koppell operates with five

dimensions of accountability in order to reflect multiple characteristics of accountability: transparency, liability, controllability, responsibility, and responsiveness. This more or less covers the comprehensive meaning of accountability mentioned by the scholars defining the concept. The five dimensions of accountability are made to accommodate Romzek and Dubnick's idea of managing the expectations and environment. The first two kinds of accountability (transparency and liability) can be thought of as foundations that underpin accountability in all of its manifestations. There is greater tension between the three substantive conceptions of accountability – controllability, responsibility, and responsiveness.

Bovens et al. (2008) formulate a comparable set of perspectives on public accountability in a constitutional democratic state with the three criteria of public accountability: information, debate, and consequence. The democratic perspective stresses the importance of control by citizen's elected representatives. Secondly, the constitutional perspective aims at the prevention of corruption and abuse of power. Public accountability should withstand the constant tendency toward concentration and abuse of power. Lastly, the learning perspective should enhance government effectiveness. Public accountability provides feedback to increase effectiveness and efficiency. Theories or frameworks show that public accountability represents many dimensions of the proper functioning of the government and a democratic society.

## Formal and Informal Accountability

Accountability could be understood further in terms of formal and informal types, which may influence performance differently. Raelin (2011) defines formal accountability as a bureaucratic mechanism and informal accountability as a post-bureaucratic process through norms and trust. Formal accountability lies with the organizational structure and institution, while informal accountability emerges from the unofficial expectations and discretionary behaviors. This distinction is important because accountability could be either a problem or an opportunity for performance depending on the emphasis of either accountability mechanism.

Since the Friedrich-Finer debate (Friedrich (1940) advocated a robust exercise of expert professional judgment/discretion; Finer (1941), by contrast, argued for obedience/responsiveness to explicit instructions.) in the 1940s, a literature discussing the impact of the internal and external (The terms "internal" and "external" are, respectively, compatible with "informal" or "implicit," and "formal" or "explicit.") environment over the bureaucratic behavior has developed. A number of scholars have concluded that the integration of individual practice and organizational environment is crucial in managing accountability in public organizations (Cooper 2012). Cooper (2012, p. 163) argues that the full responsibility of public managers must derive from a balance between internal and external control. Similarly, Mulgan (2000) contends that both internal and external factors should be considered as a single mechanism to understand why public servants decide and behave as they do. In short, it has become a common knowledge that public managers do not just passively respond to external pressures but they make judgments about what is the best for citizens. Bovens (2010) recently suggested two ways of thinking about accountability: as a mechanism (formal) and as a virtue (informal). This perspective summarizes effectively this architecture of accountability. Bovens argues that these are not contradictory but complementary (p. 962). As such, most students studying accountability seem to agree that the crucial theme of managing accountability is balancing between formal (responsiveness to explicit instructions or mechanism) and informal (bureaucratic professionalism and discretion or virtue) accountability.

While the traditional perspective on bureaucratic behavior has largely assumed that bureaucratic decisions, outputs, and outcomes are determined by external political controls, the "balance" perspective mentioned above gets support. Recent studies have demonstrated that bureaucratic values are as or even more important in explaining bureaucratic decision and behavior

than external factors and show more the role of informal. For example, Dunn and Legge Jr. (2001) found empirically that managers in local governments identify responsibility and accountability as a combination of internal and external controls, yet internal controls are slightly stronger factors than external ones. Reflecting this trend, the study of the significance of informal accountability in management rises to the surface (Romzek et al. 2012). Romzek et al. (2012) argue that informal dynamics are far less understood. Much literature on street-level bureaucracy also focuses on informal factors, such as organizational norms and worker attitudes, as powerful factors explaining behavior and performance.

## Accountability and Performance

For some scholars, accountability and performance improvement are instrumental to each other, which means one variable can enhance the other. Another strongly held position is that there are the tensions between accountability and performance due to incompatibility with each other (Behn, 2001). The tensions between the requirements of accountability and those of effective administrative action have been described as one of the classic dilemmas of public administration.

Prior to examining the A → P link, I briefly illuminate the P → A link. Evaluation efforts in the government have a long history. Performance measurement has been viewed as "the newest method of ensuring accountability." (Ho 2006) and Berman and Wang (2002) suggest that performance measurement leads to a perceived accountability improvement of government agencies. Yet, whether performance measurement matters is still elusive. The problem is that performance management rarely covers the genuine scope of accountability. It is common that performance management efforts have always been driven primarily by political accountability and measures often have focused on outputs rather than outcomes that matter to citizens. Furthermore, the scope of performance, I argue, is not as broad as accountability in terms of its conceptual scope. Hence, performance efforts explain only a small part of the enhancement of accountability. Conversely, a study of accountability as an independent variable can help capture a more accurate picture for improving the quality of public service provision.

Some believe that through greater accountability, we will enhance the government's performance (Dubnick and Frederickson 2011). In other words, accountable workers are expected to yield better productivity. Regarding the effect of accountability on performance, there has been little significant contestation and debate concerning this relationship because it is rarely challenged. The exception is Gormley and Balla's (2010) inquiry into how the dynamic of accountability has influenced varied performance of public agencies (They have attempted to evaluate accountability and performance of particular public agencies through systematic analysis using a theoretical framework of bounded rationality, principal-agent theory, interest group mobilization, and network theory. The relationships are threefold: the parallel relation, the effect of accountability on performance, and the effect of performance on accountability.). Empirical studies have identified several positive effects of accountability. Nevertheless, it is not yet understood when and which accountability mechanisms lead to these (un)desired behaviors.

Some show that the lack of accountability can lead to disasters (Romzek and Ingraham 2000). Others worry that accountability causes management problems (Koppell 2005) and hinders policy change (Schwartz et al. 2004). The main reason for skepticism about accountability is its multifaceted, often self-contradictory nature. Bovens notes how other scholars are of the opinion that "public services nowadays have far too many accountability arrangements for efficient performance." For example, accountability imposes competing pressures on employees' perceptions of their work performance, which can reduce the probability of actual mission accomplishment in an agency. Ebrahim (2005) asserts

that it is generally assumed that more accountability is better but, he goes on to argue, having more accountability arrangements in place does not ensure better performance because too many arrangements to ensure accountability can prevent organizations from achieving their missions (p. 56).

Hence, one significant reason for the slow progress in our understanding of the effects of accountability on performance may be the paradoxical reality of accountability when studying the effect of accountability on performance. While the concept of accountability has been rallied to serve the needs of highly desirable objectives, a number of scholars have discovered a dilemma (The term dilemma has been used interchangeably with "paradox" as well as "accountability crisis" and also an "accountability trap." Koppell (2005, p. 95) calls these complex accountability phenomenon as "multiple accountabilities disorder (MAD)," and Thompson (1980, p. 74) names it as "The Problem of Many Hands" as policies pass and decision made through various committees and hierarchy before they were actually implemented.) or tension in accountability systems, the so-called accountability dilemma (So far, scholars have suggested a few ways to reconcile these complex phenomena: mutual accountability, dialogue, negotiation, broadened accountability, and dialectics.). That is an undesirable effect of accountability and other forms of control. Smith (1995), for example, observes the tendency of civil servants to engage in tunnel vision. Tunnel vision makes individuals focus on specific issues accounted for while not considering the broader, unaccounted dimension of equal importance. Gaming behavior, such as "hitting the target but missing the point," is also an undesired behavior frequently observed in public organizations. Public servants intend to please the accountability stakeholders and avoid sanctions by shifting their own attitudes to preferences of the accountability stakeholders, thereby potentially undermining the purpose of accountability.

This is in line with the classic debate between responsiveness and neutral competence. Self (1973, p. 284) comments that "the growth of specialized policy fields and the increase of administrative discretion [have] reduced the decision-making capacity of elected political leadership." As well as in theory, in practice, the tension between expertise and obedience to political instructions is explicit. Empirical studies show that emphasis on legal and hierarchical accountability damages professional and political accountability. Also, focusing on political and hierarchical accountability damages professional accountability. This phenomenon is well fitted into the insight from the theory of street-level bureaucracy that recognizes "the dilemmas of the individual in public services." For instance, street-level research on child welfare services shows the perverse effects of performance-based accountability approaches.

This conundrum was well expressed in the literature of formal and informal accountability. The challenge is the art of balance between formal and informal accountability systems. While there has been a certain amount of emphasis on both accountability arrangements in theory as well as in practice, informal accountability is getting more attention in public service.

## Concluding Remark

Since few studies have been conducted to examine the role of accountability in a relationship with other public values or objectives, the effect of accountability on performance remains to be explored. In order to go beyond the inherent circumstances – the competing nature of accountability – discussed above, Acar et al. (2008) argue that "the accountability-performance link may have something to do with how managers respond to accountability pressures and transform the pressures into *management strategies*" (p. 17, emphasis added). This perspective supports the increased attention to accountability (Hwang 2016; Hwang and Han 2017).

The increased focus on accountability as an independent variable and relationship with

performance is attributable to the transition of accountability studies. The discussion of accountability has been changed from the traditional concept of *control*, which is simply giving an account after the event, to the concept of *strategic responsiveness*. As Forrer et al. (2010) posit, public accountability historically has been largely about "control" because representation is up to elected representatives (such as members of the legislature or the president) to ensure that administrators serve the needs of the people (p. 477). However, "control" is too strong a term for the accountability relationship when the bureaucracy has become an important component of good governance as the administrative state developed. Better understanding on the relationship between accountability and performance is imperative in the field of public administration in order to manage the diverse expectations and respond to constituents.

## Synonyms

Autonomy; Bureaucracy; Bureaucrats; Discretion

## Introduction

Bureaucratic autonomy is one of those concepts that have fascinated the scholars of both public administration and political science for a long time. Such fascination inspires the scholars to carry out research from diverse perspectives on different aspects of bureaucratic autonomy. However, such diversified literatures fail to produce consensus among the scholars over the meaning, definition, nature, measurement mechanism, etc. of bureaucratic autonomy. Formal scholars rely primarily on principal-agent models while some focus on more political definition of bureaucratic autonomy and European public administration scholars come up with various types of autonomy. In the words of Caughey et al. (2009), "while each scholarly approach has its own strengths, none offers a portrait of bureaucratic autonomy that is both complex enough to be realistic and general enough to travel across historical and spatial contexts."

## Bureaucratic Autonomy: Concept

The term "autonomy" is derived from the Greek words for auto (self) and nomos (law), i.e., self-law. According to the Collins English Dictionary, autonomy is the control or government of a country, organization, or group by itself rather than by others while the Cambridge Dictionary describes autonomy as the right of an organization, country, or region to be independent and government itself.

Given that, in simple sense, bureaucratic autonomy can be described as a procedure in which the bureaucrats receive directives from political principal in different manners and act as agents (Fukuyama 2013). Bureaucratic autonomy relies on the magnitude and nature of issuing such directives by the principal. However, principal can issue many supplementary directives regarding the execution of that broad guideline. There could be multiple legitimate principals issuing overlapping and conflicting directives. As for example, in China, duplicate functional agencies are found where one reports following a chain of command to the concerned ministry while the other reports to municipal or provincial governments.

To Christensen (1999), bureaucratic autonomy is the formal exemption from full supervision by the concerned political actors (e.g., departmental minister). The presence of formalization criterion in the definition implies that the exemption from political oversight should be established through properly enacted legal mechanisms. For Egeberg (1998), "bureaucratic autonomy is meant to what extent officials, in their actual behavior, are constrained by the interests and actions of other actors, like the political leadership, interest groups, news media, and international organizations."

For Davis (1969), a local official or civil servant exercises autonomy whenever there is scope to make choices among possible courses of action or inaction. Supporting the view Brooke (1984) opines that an organization can be autonomous if it can take decisions on issues reserved for upper level in similar institutions.

However, Yesilkagit (2004) observes that there are two forms of bureaucratic autonomy: formal and real. He further observes, "...real bureaucratic autonomy does not need to correspond with the agency's formal bureaucratic autonomy. An agency's formal bureaucratic autonomy only stipulates such things as the kind of the decisions the executive leadership of an agency is entitled to

take, to whom it is to report about these, and how its agency is funded for all this". In other words, an agency's real bureaucratic autonomy needs not to be equal to its formal bureaucratic autonomy. However, the inconsistency between these forms can produce challenges in two situations. Firstly, if an agency of little formal autonomy seeks more real autonomy. Here the bureaucrats want to break away from political oversight by forging their own issue niches, iron triangles, or advocacy coalitions. Secondly, if politicians want to limit the high level of formal bureaucratic autonomy already enjoyed by an agency.

Furthermore, such ambiguous nature of bureaucratic autonomy tends researchers to build different images of bureaucracy (Kim 2007). Firstly, bureaucracy is a politicized institution which can develop internal capacity, nurture external support, mobilize resources, and represent diverse social interests without the arbitration of political institutions. Secondly, bureaucracy is considered autonomous when it overlooks the desires of political principals. Thirdly, as autonomous body, bureaucracy establishes mutual relationships with political institutions.

## Bureaucratic Autonomy: Categories

Considering that literature on the definition of bureaucratic autonomy can be categorized into three different streams, which focuses on a distinct aspect of the concept. The categories are: (a) Principal-Agent Definitions Approach, (b) Autonomy as Shaping the Preferences of Other Actors Approach, and (c) Multidimensional Conceptions Approach (Caughey et al. 2009).

The first category, principal-agent approach, focuses on the formal interaction between the bureaucratic agencies and their political principals. Here the autonomy indicates the ability to ratify policies without being overshadowed by other political actors. Thus, bureaucratic autonomy is defined "as the extent to which agencies are able to implement outcomes that diverge from the preferred policies of their principals, without being prevented *ex ante* or punished *ex post*" (Caughey et al. 2009).

This approach also generates some predictions about the probable grounds for delegating power to bureaucrats. As for example, to Epstein and O'Halloran (1994, 1999) and Bawn (1995), the magnitude of political uncertainty faced by political principals determines the degree of delegation to bureaucrats. Besides, the uncertainty among elected representatives regarding returning to power again may inspire them to exercise greater delegation to protect their policies (de Figueiredo 2002; Moe 1989). Another prediction is the "ally principle" which indicates the increase in magnitude of delegation while the preference conflict – the distance between the ideal points of bureaucrats and politicians – decreases (Bendor et al. 2001). Finally, research shows that *ex ante* and *ex post* mechanisms of bureaucratic control have surfaced as alternatives as the capacity of politicians to rely on *ex post* monitoring reduces their preferences for low-discretion statutes (Caughey et al. 2009).

The principal-agent approach has some limitations as well and one of those is definitional. In some literatures, *autonomy* is often interpreted as identical to *discretion*. However, autonomy is a rich concept that entails both independent goal formation and the capacity to translate goals into outcomes. On the other hand, discretion refers to the magnitude of scope an actor has within a given sphere of decision-making. Risking such ambiguity, some authors use only one term or the other while a number of scholars use the terms interchangeably. To Carpenter (2001), bureaucratic discretion "is only a bare tendril of autonomy. . .Discretion is part of contractual arrangement between politicians and an agency they establish. . .Bureaucratic autonomy, by contrast, is external to a contract and cannot be captured in a principal-agent relationship."

The second category – autonomy as shaping the preferences of other actors – focuses on those aspects of bureaucratic autonomy that the principal-agent approach fails to capture – particularly its essentially political nature. The classic example of this approach is Carpenter's 2001

study of bureaucratic politics in late nineteenth and early twentieth century America.

Bureaucratic autonomy exists, to Carpenter (2001), "when politically differentiated agencies take sustained patterns of action consistent with their own wishes, patterns that will not be checked or reversed by elected authorities, organized interests, or courts." He identified three preconditions for bureaucratic autonomy: (a) political differentiation, (b) unique organizational capacities, and (c) political legitimacy.

Political differentiation requires an agency's preferences should be "irreducible," which means different from other social and political actors and interests. The second precondition, organizational capacity, allows agencies and bureaucratic entrepreneurs within to participate in policy experimentation and innovation and materialize their preferences into effective actions. However, both these preconditions depend largely on the bureaucratic culture of that organization. Finally, an agency makes attempts to convince a diverse network of citizens and political leaders to gain political legitimacy. The fulfillment of these conditions empowered agencies not only to implement their preferred policies facing political opposition but also to shape the policy preferences of voters, organized interests, and politicians.

Apart from Carpenter, many scholars have emphasized bureaucrats' potential to mobilize political coalitions of supporters. "No bureau survives," noted Downs (1967), "unless it is continually able to demonstrate that its services are worthwhile to some groups with influence over the resources to keep it alive." Studies (e.g., Rourke 1969; Lowi 1969; Hansen 1991; Schneider 1993) in line with this stance argue that mobilization of support coalitions can provide bureaucrats with leverage over their nominal political principals while punishing or controlling their agency. At the same time, however, autonomy from political principals often comes at the price of capture by other interests. Moreover, Yesilkagit (2004), building on Carpenter, Downs, and others, enumerates the following list of empirical prerequisites of bureaucratic autonomy: (a) "acceptation of the agency by its (political) supporters [and] beneficiaries"; (b) legitimacy based on a reputation for unique capacity and grounded in multiple networks of supporters; and (c) a distinctive and clearly recognized jurisdiction, area of expertise, and clientele.

The third category of the literature – multidimensional conceptions of bureaucratic autonomy – focuses on the relationship between bureaucratic agency and departmental ministers in European parliamentary systems. Scholars have identified many types of bureaucratic autonomy under this category, and Verhoest et al. (2004) come forward with a useful conceptual map by identifying two broad philosophical stances – "autonomy as the level of decision-making competencies" and "autonomy as the exemption of constraints on the actual use of decision-making competencies." Here the first one can be termed as the relative absence of *ex ante* restriction on agency behavior while the second one as involving *ex post* constraints and punishment.

*Ex ante* stream of autonomy includes managerial autonomy (agency discretion over "inputs", e.g., internal budgetary allocation) and policy autonomy (agency's ability to make decision over policy "outputs"). Lower policy autonomy agencies may have discretion over "(sub)process and procedures," while greater policy agencies possess the authority to select the policy along with the quantity and quality of the produced goods or services (Verhoest et al. 2004).

*Ex post* stream of autonomy has four components: (a) structural autonomy, (b) financial autonomy, (c) legal autonomy, and (d) interventional autonomy. Structural autonomy indicates the magnitude of insulation that agencies enjoy from intervention of elected officials. Financial autonomy denotes the scope of an agency in terms of having independent and secure sources of revenue, as well as the magnitude of taking responsibility for its own losses. Financially autonomous agencies are somewhat protected from financial punishment, e.g., budget cuts from political principals.

Legal autonomy indicates the magnitude of protection that an agency enjoys under the law from elected officials in terms of agency's "allocation of decision-making competencies" (Verhoest et al. 2004). Finally, interventional autonomy describes an agency's freedom from *ex post* oversight and punishment by elected officials.

Many scholars follow a similar approach to Verhoest et al. (2004) but with different categories. As for example, terming the first three components as the variants of formal bureaucratic autonomy, Christensen (1999) provides a comparative picture (Table 1):

Moreover, Ellison (1995) describes three indicators of autonomy:

(a) Avoiding control by elected officials: This implies any action an agency takes to thwart external attempts to change its political, legal, and fiscal autonomy.
(b) Resisting predation by other agencies: This indicates an unwillingness to share or give up programmatic responsibilities with other units of government.
(c) Avoiding unwanted functions: This embodies an unwillingness to accept new tasks that may detract or hinder the agency's ability to perform its critical tasks.

## Bureaucratic Autonomy and Quality of Government

Since more autonomy for bureaucrats indicates lesser directives and less autonomy means higher directives from political principals, Fukuyama (2013) finds that the relationship between bureaucratic autonomy and quality of government looks like an inverted U.

The figure shows that at one end – complete subordination – the bureaucracy has no scope for exercising discretion rather restricted by detailed rules and regulations set by political principal resulted into poor quality of government. One of the worst scenarios could be the staffing entirely

**Bureaucratic Autonomy, Table 1** Variations in formal bureaucratic autonomy

| | Structural autonomy | Financial autonomy | Legal autonomy |
|---|---|---|---|
| **Less autonomy** | Agency head reports to minister through unbroken departmental hierarchy<br>Minister appoints agency head | General central government regulations apply | Legislation leaves no/little discretion to departmental minister; contains no authorization to issue general regulations |
| | Agency head reports to the minister after consultation with advisory board on which the majority are appointed by/selected among nongovernmental actors<br>Minister appoints agency head | Agency financed through sales proceeds; deficit covered by appropriation that varies with proceeds | Legislation authorizes minister to issue general regulations to fulfill the policy goals defined by the law; agency head's authority, a matter of ministerial delegation |
| | Agency head reports to board of directors, on which the majority is appointed by the minister who can end term on a discretionary basis<br>Board appoints agency head | Agency financed through sales proceeds and fixed appointment at central government budget | Legislation authorizes agency head to decide individual cases that cannot be brought to the minister; the minister cut off from general and specific intervention in case-processing |
| **More autonomy** | Agency head reports to board of directors on which the majority are appointed for fixed terms by nongovernmental actors<br>Board appoints agency head | Agency financed through sales proceeds; agency budget not part of central government budget | Legislation authorizes agency to issue general regulations to fulfill policy goals defined by the law |

Source: Christensen (1999)

by political appointees losing the control over internal recruitment and promotion. The other end – complete autonomy – quality of government is also poor as the bureaucracy has lesser or no directive from political principal and enjoys freedom in framing internal procedure and goals. As for example, both Imperial Germany and Japan experienced the development of very high-quality autonomous bureaucracy especially the military service in the periods before World War I and World War II. This bureaucracy took over the task of formulating foreign policy from the political authorities.

Fukuyama (2013) further observes that if appropriate degree of autonomy is an essential precondition of ensuring high-quality government then both Weberian and principal-agent models fail to explain how bureaucracies should work. According to the Weberian model, bureaucrats' job is to implement the decisions of political authorities only following the set rules and regulations. For that, despite the technical capacity, bureaucrats do not possess the authority to set agendas independently. The principal-agent form is also not free from such inadequacy as agents (bureaucrats) simply carry out the directives of political principals.

## Measuring Bureaucratic Autonomy

Researchers and scholars of political science and public administration have found it difficult to find an appropriate method to measure bureaucratic autonomy properly. The most common approach is to rely on expert survey where perceptions of experts on a given bureaucracy are recorded (Fukuyama 2013). However, this approach has some inherent challenges regarding the proper conceptualization of the concept itself along with the nature of expectations from experts. There are apprehensions that experts may not have adequate criteria for judging the aptness of issued directives or search multiple or conflicting directives as a measure of subordination.

Fukuyama (2013), however, proposes a new measure focusing on the degree of clientelism or political interference in bureaucratic operations as autonomy is the opposite of subordination. Terming the measures as more objective one, he opined that "One could look, for example, at the relative number of classified versus political positions in a bureaucracy." However, this measure is also not free from flaws as such measure gets only one type of subordination related to personnel. Bureaucracies still face the risk of being restricted if political principal issues multiple contradictory directives that have no connection with staffing or by introducing exhaustive rules and regulations for bureaucratic behavior.

## Concluding Remarks

The concept of bureaucracy itself is in an image crisis in many parts of the world due to allegation of abuse of power and attempted control over political authorities though the Weberian interpretation of the concept presents it as a loyal servant of the political actors. According to Weber, the bureaucracy should not enjoy any autonomy rather must be engage in implementing the directives of political actors as accurately as possible. Despite that, bureaucratic autonomy has become a reality in the domain of governance and public administration, and it seems the appropriate amount of autonomy is good to ensure quality of service delivery and governance.

## Definition

Bureaucratic capacity and policy implementation are crucial for the success of elected representatives.

## Introduction

In a democratic system of government, voters elect their representatives (the legislative branch) for making laws and overseeing activities of the executive branch of government. In some systems, a majority of elected representatives select their leader (e.g., prime minister) to head the executive branch. In other systems, citizens elect both the representatives (the legislative branch) and the leader of the executive branch (e.g., president). Whatever the form of a

democratic system may be, neither elected legislators nor the head of the executive branch can, by themselves, formulate and implement public policy because they do not have the required expertise. They need individuals, commonly known as bureaucrats, for the (administrative) implementation of policies, rules, and laws.

As per Trikha (2009), there are four pivotal attributes central to bureaucracy: (a) clearly defined roles of administrative labor; (b) a consistent personnel recruitment based on specialized skills; (c) distribution of authority, responsibility, and status among individuals; and (d) a network of individuals connected by the flow of information and patterns of cooperation. The main goal of the bureaucrats under a despotic government is to comply with the rules, directives, decrees, and so on, without having to worry about the exercise of their expert skills or appropriateness of the decisions made. In a democratic system bureaucrats are not only required to comply with rules and use their expert knowledge, the legislature also has the power of the purse to control bureaucrats' behavior.

The relationship between elected representatives and bureaucrats gives birth to a web of principal-agent relationships because voters transfer their sovereignty to the elected representatives, who then trust the executive branch (e.g., cabinet of secretaries) to make and implement policies within the framework of the directions given to them by the legislature (Bovens 2005). Elected representatives are the agents of the voters. Cabinet ministers are agents of elected representatives and voters. Bureaucrats working in the ministries or departments are agents of the cabinet ministers. Bureaucrats employed by agencies and other institutions established to work under the ministries or departments are agents of bureaucrats working in the ministries or departments.

The complexity of the relationships among different principals and agents, and many of them being agents' agents, gives rise the agency problem addressed by the principal-agent paradigm or agency theory. The network of different principal-agent relationships within a democratic government is also represented by interdependency among different politicians and bureaucrats. The effectiveness and efficiency of principal-agent relationships are crucial for the success of a government because if agents are not able or not willing to effectively implement policies, voters may replace their agents by electing different representatives. There is no doubt that delegation of authority to expert bureaucrats (agents) has its benefits. However, there is always a risk that bureaucrats may not perform to fulfil their principal's expectations (Holmgren 2015).

Bureaucratic capacity building refers to the development of administrative structure influenced by a combination of organizational and institutional learning processes and cooperation among different government bodies, institutions, or agencies (Sátyro and Cunha 2018). It is possible that in some democratic systems, bureaucratic capacity may be lacking. In other words, the bureaucrats may not have the personal capacity (education, skills, and training) to follow their principal's directions, or the organizational structure is not optimized for smooth functioning, or there is a lack of funding needed for policy formulation and implementation (Huber and McCarty 2004). A principal may design incentives or take other steps to motivate agents to perform as per the given directives (McCarty and Meirowitz 2007). A principal has to decide how to make and implement policies when bureaucratic capacity is lacking.

Bureaucratic capacity is crucial for developing regulatory regimes for dealing with social problems and other commitments. For example, governments in the less developed countries with high bureaucratic capacity are able to create bureaucratic hurdles by way of environmental regulations in response to pollution-intensive trade with other countries (Gamso 2018). In addition, bureaucratic capacity of heads of government agencies is critically important for the attainment of the desired policy outcomes (Berkowitz and Krause 2017). Policy implementation status can be defined as the state of policy targets and policy implementation outcomes. Policy implementation error occurs when policy targets are not achieved. Policy implementation efficiency occurs when policy implementation outcomes exceed the policy targets.

In this conceptual entry, an endeavor is being made to demonstrate a few simple computational aspects of bureaucratic capacity and principal-agent relationship in relation to public hospitals in the Australian state of Victoria. Thus, the aim of this entry is to (a) review the existing literature encompassing the concept of bureaucratic capacity; (b) present a brief summary of the organization of public healthcare in Australia; and (c) present a novel approach to measure the bureaucratic capacity, including policy implementation status, policy implementation error, and policy implementation efficiency in relation to the public hospitals in Australia.

This entry makes the following contribution to knowledge. First, it fills the gaps in knowledge by extending the concept of bureaucratic capacity to public hospitals in Australia. Second, it presents an example of policy implementation status computations at the hospital level. Third, it describes how these computations can also be done for different groups of hospitals (peers) and the entire hospital systems. Fourth, it links to healthcare services delivery by public hospitals. Lastly, the determination of bureaucratic capacity at different levels of bureaucracy or hospital administration could also provide clues regarding the levels of administrative intensity (the ratio of core to noncore personnel), as excessive levels of administrative intensity may negatively affect organizational performance (Ryu and Christensen 2018).

The entry has been organized as follows. First, a narrative literature review has been conducted to illuminate the different aspects of bureaucratic capacity. Second, the organization of public hospitals in Australia has been briefly described. Third, the computational aspects of bureaucratic capacity in the context of public hospitals in the Australian state of Victoria have been presented. Fourth, policy implementation status, policy implementation error, and policy implementation efficiency computations have been discussed. In the end, the conclusion, limitations, and recommendation for future research have been laid out.

## Literature: Delegation and Bureaucratic Capacity

In situations where agents possess highly technical knowledge and the principal has few alternatives to get the relevant expert information from elsewhere (e.g., national defense and some economic regulations), the agents may be able to promote their own agenda (Langbein 2004). The issue of checks and balances may emerge, when there are more than one principals (e.g., parliamentary committees and cabinet ministers) and also when the principal is not able to impose incentives on a passive agent (Miller 2005). In Western countries, partisanship has a limited impact on bureaucracy because of the strong institutionalized selection and retention processes, whereas in some non-Western political systems, appointments of bureaucrats are non-merit based, and the justification is that such a system is needed for national unity (Peters 2001).

In a democratic system, a multidimensional relationship exists between politicians and bureaucrats. As per Pollitt and Bouckaert (2011), there are four key features of a politico-administrative regime: (a) the state structure and constitutional arrangements among politicians and bureaucrats; (b) the nature of the executive government at the central level and the political system (majoritarian- or consensus-oriented); (c) the relationship between ministers and bureaucrats, e.g., agents and professional experts; and (d) the dominant culture prevalent in the administration (the way things are done).

There are tensions between the political executive principals and their bureaucrat agents because bureaucrats may be resistant to the principals' policy choice or be engaged in potential abuse of discretion (Koven 2019). There may be five constraints on public policy: (a) economic constraints e.g., the balanced budget constraints, the balance of payments constraints, and the balanced budget constraints, combined with the private sector consumption and investment constraints (Quiggin 2006); (b) political feasibility and power/interests (Galston 2006); (c) institutional constraints (Immergut 2006);

(d) social and cultural constraints/enablers (Bobrow 2006); and (e) the impact of globalization – trade, foreign direct investment, finance, and environmental constraints (Hay 2006).

In political systems with low bureaucratic capacity, politicians may find it hard to induce the bureaucrats to deliver the desired outcomes because bureaucrats may not be much interested in complying with legislation (Huber and McCarty 2004). In addition, policymakers or principals are unlikely to allocate huge sums of money to social programs if there are doubts about the bureaucracy's competence and reliability (capacity), particularly in cases where bureaucrats are expected to make discretionary decisions on a case-by-case basis (Dahlström et al. 2013). Legislators (as principals) give incentives to agencies to achieve their goal of effective policymaking; therefore, a bureaucratic discretion model that does not consider the performance of agents underestimates the effect of conflict between the legislature and executives with regard to the extent to which discretion is to be granted.

## Organization of Public Healthcare in Australia

Australia is a representative democracy in which the prime minister is the head of the executive branch. There are two houses of parliament based in Canberra. There are six state parliaments (Queensland, Tasmania, Victoria, South Australia, Western Australia, and New South Wales). In addition, there are two territory legislative assemblies (Australian Capital Territory and Northern Territory). The Australian state of Victoria has a bicameral parliament, comprising of the Victorian Legislative Council and the Legislative Assembly. The leader of the governing party or a coalition of parties is called the premier.

In Australia, public healthcare and hospitals are jointly funded by the Commonwealth and the State or Territory governments. Victoria, being a state in Australia, provides Medicare (universal healthcare coverage) to citizens, permanent residents, and certain categories of other individuals. The Commonwealth and the states or territories contribute to the national healthcare funding pool. Both activity-based and block-funding mechanisms are used. A flow chart of the public hospital funding in Australia is shown in Fig. 1.

Public hospitals in Victoria can be divided into two main categories: (a) Metropolitan Melbourne hospitals and healthcare services and (b) rural hospitals and healthcare services (State of Victoria 2018). A public hospital has a governance board and an executive team. The governance board is accountable to the Minister of Health of Victoria. The executive team is accountable to the board and oversees the operations, strategic direction, and performance (Alfred Health Victoria 2019). Between the Minister of Health and the board of a public hospital, there is one more group of players – the bureaucrats at the Department of Health and Human Services (DHHS). The DHHS administers various Acts and regulations related to healthcare in the state of Victoria.

## Computational Aspects of Bureaucratic Capacity in Public Healthcare Organizations

The Minister of Health of Victoria is responsible for providing high-level policy directives, either by way of the Acts or regulations passed by the Parliament of Victoria. It is assumed that one of the factors that may influence the reelection of the minister and other members of the Parliament of Victoria is a successful healthcare policy formulation and implementation. In other words, the Minister of Health is the principal, and the agents are the bureaucrats working at the DHHS. Thus, policy implementation is the responsibility of the bureaucrats working at the DHHS. As an institution, the board of directors at the hospital level is the agent of the bureaucrats working at the DHHS. The executive management team of a public hospital is an agent of the board of directors of the public hospital.

The focus of this article is limited to the relationship between the Minister of Health of Victoria and the bureaucrats working at the

**Bureaucratic Capacity and Public Healthcare Organizations, Fig. 1** A flowchart of public hospital funding in Australia adapted from NHFB (2016)

DHHS. A policy implementation model, as per Epstein and O'halloran (1999) can be expressed as follows:

$$\max_p \left\{ -(a - p + \varepsilon)^2 \right\} \textit{ subject to } p \in P \quad (1)$$

where $p$ represents a policy, choice made by the legislature; $a$ is the ideal point of policy choice; and $\varepsilon$ represents the error or the difference between the policy choice and actual policy implemented by the bureaucrats. Furthermore, $P$ represents the principal's (politicians) policy choice.

With regard to bureaucratic capacity, one of the agent's maximization models by Huber and McCarty (2004) suggests that:

$$p^* = \{a + \varepsilon\} \textit{ if } p^* - \varepsilon \leq a - \Omega \quad (2)$$

The above $p^*$ represents the policy as implemented; $a$ is the point where a social planner (principal) would like the policy to be; $\varepsilon$ is policy implementation error; and $\Omega$ is the measurement of bureaucratic capacity. If a policy is not fully implemented, there would be a policy implementation error. By following the guidelines from the Minister of Health of Victoria, the DHHS bureaucrats are expected to set the healthcare policy at $p$. Thus,

$$p - p^* = \text{policy implementation error (PiE), if } p > p^* \text{ (the policy targets have not been met and policy outcomes are below policy targets)} \quad (3)$$

$$p - p^* = \text{policy implementation efficiency (PiEf), if } p < p^* \text{ (the policy targets have been exceeded)} \quad (4)$$

It is proposed that a perfect bureaucratic capacity will be represented by 0, and PiS (policy implementation status) can be captured by comparing the actual policy outcomes to the policy targets. Thus, if PiS $< 0$, then PiS $=$ PiE; if PiS $> 0$, then PiS $=$ PiEf. Ideally, both the Minister of Health and the bureaucrats working at the DHHS ought to keep PiS $= 0$ and avoid a situation where PiE

occurs (Dixit and Sambasivan 2018). In situations where policy outcomes are better than policy targets (occurrences of PiEf) and in others there are occurrences of PiE, the Minister of Health may take one of the following two actions: (a) divert the resources from the areas of PiEfs to PiEs and (2) focus solely on either PiEs or PiEfs.

By taking a pragmatic approach, it is proposed that a public hospital's performance outcomes ($p^*$) for the selected measures be considered at three levels: at the hospital level, at the peer level, and at the system level (where the data is available) against the average performance outcomes of the peer group to which a hospital belongs. If a hospital belongs to the unpeered group, it has been excluded from the computations because there is no yardstick or benchmark (peer average) that can be used to compare its performance with. In this entry, PiE and PiEf computations are done only at the hospital level. The notations and corresponding examples of PiS computation are presented below.

### Policy Implementation Status (PiS) at the Hospital Level (ALOS)

Alfred Health provides a wide range of healthcare services in Victoria through three hospital campuses, a large network of community programs, and 14 statewide services. The relevant data is available from the Australian Government hospital data website (AIHW 2019). The policy implementation status computations for the year 2016–2017 for *appendix removal* surgeries can be performed as follows:

$$PiS \rightarrow Hos_{a1} = (pHos_{a1}) - \left(pHos^*_{a1}\right) \quad (5)$$

where $PiS \rightarrow Hos$ is the policy implementation status of a hospital *Hos*, *a* being the outcome indicator, and *1* being the subcategory of the outcome indicator average length of stay – by condition (ALOS).

*PiS* for average length of stay ($a = ALOS$) of the Alfred Health (*AH*) for the condition *appendix removal* ($1 = AR$) can be expressed as follows:

$$PiS \rightarrow AH_{ALOSAR} = (pAH_{ALOSAR}) - \left(pAH^*_{ALOSAR}\right) \quad (6)$$

$$PiS \rightarrow AH_{ALOSAR} = (2.1) - (1.9) = 0.2 \text{ days of PiEf} \quad (7)$$

Thus, if 1000 patients underwent *appendix removal* surgery at Alfred Health, *PiEf* in total days would be = 1000 × 0.2 = 200 patient days. If the per day cost of patient stay in the hospital is known, the savings due to the policy implementation efficiencies could also be computed.

*PiS* for average length of stay ($a = ALOS$) of the Alfred Health (*AH*) for the condition *gynecological reconstructive procedures* ($2 = GRP$) can be expressed as follows:

$$PiS \rightarrow AH_{ALOSGRP} = (pAH_{ALOSGRP}) - \left(pAH^*_{ALOSGRP}\right) \quad (8)$$

$$PiS \rightarrow AH_{ALOSGRP} = (1.9^*) - (2.2) = 0.3 \text{ days of PiE} \quad (9)$$

Thus, if there were 1000 patients who underwent gynecological reconstructive procedures at Alfred Health, *PiE* in total days would be = 1000 × 0.3 = 300 patient days. If the per day cost of patient stay in the hospital is known, the over-the-target spending due to the policy implementation error could also be computed.

Similarly, the overall PiS status of a hospital for all conditions (data for 12 conditions is available; however, computations for only 2 conditions have been shown in this section), *N* being the number of conditions, can be expressed as follows:

$$PiS \rightarrow Hos_{a1-n} = \Sigma\left[(PiS \rightarrow Hos_{a1}) + (PiS \rightarrow Hos_{a2}) + (PiS \rightarrow Hos_{a3}) + \ldots (PiS \rightarrow Hos_{an})\right. \quad (10)$$

## Discussion

The principal-agent paradigm explains the complex relationships between principals, agents, and agents of agents (Bovens 2005). Bureaucrats are expected to be experts, capable of implementing policies effectively and efficiently. Like the

B

voters, legislature, and politicians, bureaucrats too have to delegate policy implementation to other bureaucrats, management personnel, and healthcare professionals. If the bureaucrats, management personnel, and healthcare professionals are not able to or not willing to successfully implement the policy at the hospital level, the outcomes desired by the politicians and the expert DHHS bureaucrats would not be achieved. That is why there exist interdependent relationships between the principal and different agents. The success of the Minister of Health ultimately depends on the agents working at the hospital level.

Though bureaucratic capacity assumes a significant role in the successful implementation of policy, the principal has to be able to identify exactly where it is lacking, because there are many players engaged in the delivery of healthcare services to patients. It is also necessary for designing incentives, changing bureaucratic structures, and providing funding where it is needed. As demonstrated by the computations in the preceding section, a principal may find that policy outcomes are better (policy implementation efficiency) than the targets. In such cases, it may be necessary to reallocate resources from policy implementation efficiency areas to policy implementation error areas. These computations can be performed at the peer level and at the whole healthcare system level. Further, the expert bureaucrats at the DHHS may use other methodologies to set the policy targets. The policy implementation status may also be used for the adoption of evidence-based management decision-making. A discreet policy implementation status may also improve the checks and balances mechanisms for the scrutiny of healthcare policy implementation and reduce or remove the constraints to public policy.

## Conclusion

This entry reconceptualized bureaucratic capacity, policy implementation status, policy implementation error, and policy implementation efficiency in the context of Australian public hospitals. It explained the nature of different principal-agent relationships in relation to healthcare policy implementation in Australia. It presented a method of policy implementation status (error and efficiency) using the performance indicator data of a public hospital in Victoria. The limitation of this article is that only one set of computations (at the hospital level) is shown, mainly because it introduces a novel idea that can potentially be used to extend and add new dimension to the delegation and bureaucratic capacity literature.

It is the first step toward extending the concept of bureaucratic capacity to public hospitals. It is hoped that future research will include game theoretical modeling of policy implementation error and policy implementation efficiency. Such an approach would be helpful in setting incentives for performance and punishments for non-performance. Policy implementation status can also be explored in other parts of the public healthcare sector. Future research may also include the potential use of bureaucratic capacity computations to modify policy targets during the current policy year (period) without waiting for the following year, by allocating and reallocating resources. There exist many research opportunities to use predictive modeling and other techniques, such as structural equation modeling to further enrich the bureaucratic capacity and policy implementation literature.

# Bureaucratic Culture in the Context of Globalization

Santap Sanhari Mishra
Institute of Leadership & Good Governance, Ethiopian Civil Service University, Addis Ababa, Ethiopia

## Synonyms

Administrative system; Civil service; Formal organization structure; Hierarchy; Organization culture

## Definition

Bureaucratic culture is a formal organization structure whose members share common attitudes, values, beliefs, orientations, and sentiments which are distinguished from others.

## Introduction

By peeping into the kaleidoscope, one can find various color patterns of bureaucracy across the globe. It is no exaggeration to tell that, in almost all the countries, bureaucracies acted like growth agents for the development. But, over the years, bureaucracy has earned more criticisms than applauses. Such critical views are given without much empirical supports. Moreover, such

criticisms failed to open any window for a society completely devoid of bureaucracy. Basically, bureaucracy is regularly criticized for its typical cultural practices. The Weberian bureaucratic culture has successfully permeated to every aspect of administration in almost all countries, even though "the ideal type" of Max Weber was challenged from the beginning. Bureaucracy was blamed for many international events in the 1970s, and the most serious challenges to bureaucracy came from the new rights groups. The advent of public choice theory undermined the bureaucracy heavily. Bureaucracy is almost viewed as a synonym to "the culture of resistance to change." By the 1980s, governments across the globe started to ponder over the role of bureaucracy and bring certain changes (Hughes 2012). By the 1990s, the changes were more evident in the form of "new public management." Many countries started to carry out the reforms, making it a global movement (Kettl 2005).

The purpose of this entry is to discuss the traditional bureaucratic culture which was under scanner before proceeding to analyze the changes carried out to fit the system. It begins with the overview of the concept of bureaucratic culture. Then it discusses the criticisms of the traditional bureaucratic culture, which is followed by a broad discussion on the impact of globalization on bureaucratic culture. It then moves to discuss the changes brought in to fit the political system of a country in the context of globalization. Finally, it concludes with an overview of need of existing changes in bureaucratic culture and also tries to paint on the future of bureaucratic culture.

## Bureaucratic Culture: The Concept

F. W. Taylor (1911) advocated for "one best way" of working and adhering to scientific management principles. This means delivery of goods and services is by bureaucracy only (Hughes 2012). Due to this inevitability, bureaucracy got enormous power in a society. Due to gargantuan size and unquestionable importance given by traditional public administration, bureaucracy became a class in itself. It has developed its hierarchical structure, values, norms, and also patterns of behavior. That led to what we call "bureaucratic culture" and almost synonymous with strict adherence to rules, regulations, procedures, and practices. Bureaucracy is treated as a culture because the members of a bureaucratic organization hold common knowledge, value, beliefs, and customs. Such cultural dimensions determine the bureaucratic behaviors and actions. The bureaucratic behaviors and actions are completely dependent upon the sociocultural values. That is the reason why the bureaucratic culture will vary from country to country. Whether bureaucracy is corrupted, or bureaucracy is highly powerful, these all depend upon the society from which bureaucracy comes. The cultural perspective of bureaucracy contains all orientations to actions (Verma 1978). It is a multidimensional item covering attitudes, values, and beliefs giving a sense to administrative processes and behaviors. A same view has also taken by Zafarullah (2013), as he told that besides the external stimuli, bureaucratic culture is dependent on internal variables like structure, rules, authority relationship, etc. The bureaucratic culture affects the members' behavior and that differentiates from others. Like any other cultural system, bureaucratic culture also carries some components like emotional bonding among members, attitude of helping the members, and creation of strong organizational and also member identity. It is reflected in their tangible behavior patterns like official protocols, paraphernalia, use of jargons, dressing styles, maintenance of decorated offices, and moreover how they socialize after the official hours aptly proving "birds of same feather flock together."

Verma (1978) also opined that like any cultural system, bureaucracy has also a socialization process. The members are developing and sharing those traits and behavior patterns among themselves. Max Weber's "ideal type" approach to bureaucracy has certain characteristics which can be taken into consideration as bureaucratic cultural traits. By making ideal type bureaucracy, Weber intended to see variations in administrative and bureaucratic culture (Byrkjeflot 2018). It is a fact that Weber has never defined bureaucracy but only outlined the characteristics. His list of

characteristics reflected the picture of contemporary German society during his times. The cultural traits of bureaucracy as outlined by Weber himself are legal-rational authority, hierarchy, impersonality, specialist, and rule centric. Weber considered these cultural traits as integral to achieve the goal, i.e., "ideal state" in an organization (Tompkins 2005).

## Traditional Bureaucratic Cultures: Criticisms

As mentioned earlier in Introduction, bureaucracy was viewed more negatively by scholars without much empirical backup, but it does not mean that bureaucracy is completely rotten from inside. Bureaucracy is a system of roles (Katz and Kahn 1966), and that is the most important positive aspect of bureaucracy. By performing the roles, it is destined to achieve the organizational goals and objectives. Another positive stand was taken by Downs (1967) when he told that officials in an organization endeavor to reach their goal rationally in most efficient manner. He was treating organization as a system. But Yaney (1982) questioned the assumption of bureaucracy as a system because a human organization can't work like an engine. Anthony Downs (1967) also told about the negative sides of Weberian bureaucracy for neglecting the informal structure and was very much skeptical to the hierarchy of the bureaucratic organizations which may hamper information flow. Before him, Merton (1952) had also criticized Weber for neglecting informal organization. Verma (1978) mentioned a number of critical terms used by different authors to describe bureaucracy like "bureaumania" by M. de Gournay, "trained incapacity" by Veblen, "occupational psychosis" by Dewey, and "professional deformation" by Warnotte. Thompson (1961) mentioned of a condition of "bureaupathic," where the cultural traits are responsible for deviation from organizational ideals. Too much adherence to rules and regulations leads to "red tapism" and administrative stagnancy. Michel Crozier (1964) was so much indignant with the bureaucracy that he told, bureaucracy as an organization fails to rectify by learning from its errors. Hummel (2007) called bureaucracy a bomb that threatens bureaucracy because it is detached from the human society, emotions, and individual thinking.

B

## Impact of Globalization on Bureaucratic Culture: The Reality

Influenced by the public choice theory and vehemently advocated by the new rights politics, a gradual shift occurred in public administration toward the last quarter of the twentieth century. The shift was basically from "administration" to "management" or more lucidly from "process and procedures" to "results." The bureaucracy, which was infamous for process centric, also received a major blow from "Thatcherism" and "Reganomics" leading to a free market economy. This emergence of globalization and market-friendly administration called as "new public management" challenged and influenced the role of the state and bureaucracy (Haque 1998). But the new public management, which clamored to get rid from the traditional bureaucracy, actually has given rise to a private sector bureaucracy (Meier and Hill 2007). The private sector bureaucracy is difficult to make accountable, and as a result of that, the state actually is in between "Scylla and Charybdis."

Haque (1998) has maintained the worldwide imitation of western institutions and practices as an immediate impact of globalization. This has been rightly corroborated by Kim (2008) as he mentioned developing countries gained less from globalization but western countries gained much. He has mentioned Brookings Institution data adjusted from *The Wall Street Journal*, 2003, to present the massive growth in employment in US federal government contracts since 1999. On the other hand, international aid agencies emphasized "de-bureaucratization" as a prior condition on least developed and developing countries.

Haque (1998) had the opinion that most important phase of globalization was the process of colonization. Administratively as an impact of globalization, bureaucratic culture – structure,

attitudes, and norms – in non-western countries (Asia, Africa, and Latin America) continued to follow the western legacy (Haque 1996). It led to reforms in administration, foreign training of the officers, close contact with international experts, etc. In the post-cold war period, with the emergence of welfare state, bureaucratic roles and behaviors were changed (Haque 1998). This new change in the bureaucratic responsibilities was necessitated to accommodate the need of the diverse sections. But bureaucracy became powerful. As for example, in case of India, there was a growing reliance on bureaucracy with the introduction of myriad number of development schemes for employment generation and poverty alleviation. The bureaucratic culture was expanded and had been rightly called by Sklar (1991) as "bureaucratic bourgeoisie" or "administrative bourgeoisie." In fact, this expansion of bureaucratic culture was supported by the notion that state as a change agent for welfarism.

As earlier mentioned in this section, this monopoly of bureaucratic culture was challenged in the 1980s with the market-driven globalization. With the crumbling of the international boundaries, new public management advocates like Hood, Osborne and Gaebler, and Pollitt demanded better government instead of big government. The steel frame of the bureaucracy started to wither as state was replaced by market. But it seems the euphoria from desegregation of bureaucracy was short lived. In many countries privatization process in major service sectors became a reality, but the immediate impact of globalization on bureaucratic culture is difficult to be ascertained. In many countries, privatization committees were set up. In case of India, a separate disinvestment ministry was set up, though it is no more now. Similarly, financial management improvement program in Australia, modernization program for the public sector in Denmark, and renewal of the public service in France have come up as changes in bureaucracy as impact of globalization (OECD 1993; Carlos and Pereira 1997). But it never sounded the death knell for bureaucratic culture. Meier and Hill (2007) have made it clear that all the Weberian principles are still safe except the "written files," because of shift to online governance system.

Haque (1998) observed that the market-based globalization had made the bureaucracy obsolete in many countries. It is true that people want better services, and post-globalization period ensured that by providing a lot of options to the people. But the trust and faith of the people are still on the state. It is still the government that matters. In spite of opening the major services sectors to the market, it is the government that controls them indirectly by the policy routes. Government may not be present in the competition to provide services or may be weak as compared to the competitors, but it is government everywhere, making bureaucracy all powerful. Meier and O'Toole (2006) opine that bureaucrats are powerful and are able to change political programs to reflect their own values – they are strategic agents. Hence it can be safely assumed that bureaucratic culture has not been diminished as an impact of globalization. Bureaucratic size has come down in many countries but not the power. The foundation for growing bureaucratic culture was laid by Weber himself as he was talking about "Dienstwissen," i.e., knowledge by experience. Experience in service matters and by gaining from that experience, bureaucracy becomes a think tank for their political masters. Mangset and Asdal (2018) by interviewing civil servants from France, Norway, and Britain demonstrated that note writing and procedures associated with such notes are resulted in authority for bureaucracy.

Meier and Hill (2007) are very optimistic about the prosperity of bureaucracy. Their arguments are hinged on the large-scale activities of the government to perform. In a recent literature, Workman (2015) depicted the true picture of American bureaucracy, which is not only powerful in policy implementation but also influences the legislative agendas of the congress. So, no country will afford to play with fire by diminishing the roles of bureaucracy. Globalization was boosted by information technology revolution. It is told in a common parlance that technology has also

changed the bureaucratic culture. Berman and Tettey (2001) in African context have proved that technology has not been able to change the authoritarian decision-making processes. Notwithstanding the hiccups experienced from the beginning, bureaucracy actually has taken deep roots. Long back, Verma (1978) expressed that "a glorious revolution" can only expel bureaucracy, but Weber had already provided a "safety valve" as he was of the view that bureaucratic machine would continue in spite of revolution. That is why long back Jacoby (1973) prophesied about bureaucratization of the whole world and doubted of going beyond it.

So, to put in a nutshell, bureaucratic culture was affected by globalization, but not much. Many new practices influenced by the market-based approach have been ushered in public administration in many countries across the globe. The bureaucracy is intelligent enough to acclimatize with the new situations and environment. As a result of that changes in bureaucratic culture, settings, values, and behaviors occurred only to make long live bureaucracy.

## Changes in Bureaucratic Culture in the Context of Globalization

From the very beginning, I have taken a stand that bureaucratic culture in the context of globalization will vary from country to country as the bureaucracy derives its cultural values from the society on which it is based. Kim (2008) has an interesting observation of impacts of globalization in three categories of bureaucracy. In the context of bureaucracy of western countries (Western European and North American), globalization has helped for a strong public administration system. This is because the process of globalization has helped them economically. In the countries having single-party regime or authoritarian regime, where the bureaucratic culture was intact, keeping the impact of globalization was minimal. But in the third category of bureaucracy (rapidly developing countries), Kim (2008) doubted about the actual impact of globalization.

Taking a general note, in the context of globalization, the most important change has come in bureaucracy's work culture. To address the social unemployment issues, or implementing many developmental schemes of the government, many new jobs were created, but in the specific skill category. In this way, Weber's idea of "specialization" has become more nowadays. But, the size of public service has come down. The massive automation processes, coming out of globalization is mainly responsible for this. In India the size of public bureaucracies was 3.3 million (7th Pay Commission Report, 2015), while way back in 1994, sanctioned strength was 4.1 million. Some of the jobs have been contracted out to consultancies. The rigid hierarchy has also become flexible to some extent to accommodate the highly skilled consultants. But the controlling nature of bureaucracy is still there. Governments are forming committees flooded by bureaucrats, who are bending the rules and regulations to help them only as usual. Zafarullah (2011, 2013) in the context of bureaucracy of Bangladesh has told that the trend of new public management has induced very little changes in theirs culture.

The bureaucratic behaviors have been drastically changed particularly in dealing with public. The barrier between the common man and the administration are no more. In many countries, the mobile numbers of the bureaucrats are available to the public. They are more citizen centric now. The traditional bureaucracy was unresponsive to popular demands and desires. This culture has been changed to some extent. As the post-globalization scenario established the priority on results, indifferent attitude to public interest has taken a back seat. Again, this trend also not same everywhere. Score of examples from African countries reveals the callousness of the public bureaucracy. But another notable culture has been developed, which was not earlier. Before the new public management phase, the political executives (ministers) were active in their political leadership. But in the present context, in the guise of "civil service anonymity," bureaucracy is more active politically. In India,

many instances are there where in-service bureaucrats are openly expressing their allegiance to certain political parties and the political leaders in power are protecting them. In the African countries like Ethiopia and Tanzania, public servants do openly participate in the political party programs. One of the infamous bureaucratic cultures was too much process centric. Adherence to rules and regulations was creating administrative stagnancy and delay. They had a tendency to expand the work to make themselves busy. In a globalized world, this tendency has come down, as focus is now on result. Feeling of "belonging to a class" is another bureaucratic culture, which has come under attack also. The bureaucracy was a class in itself and its members had made it a water tight compartment. As a result, the superiority complex was not allowing its members to work by putting shoulder to shoulder. But after the ushering of globalization, many specialists both national and international have started to work. It became need of the hour for a proper coordination. Hence the "superiority complex" has come down. But the "empire building" culture of bureaucracy is still intact. They still believe in expanding power by creating more organizations or organization layers. Globalization has also ensured "passing the buck" culture to be changed. The new public management era has not only focused on result but also focused on taking responsibility for the result.

## Conclusions

In spite of massive criticisms, bureaucracy is not going to take a back seat. The strong market-based reforms in public administration have dented the bureaucratic culture but not as boasted. Hummel (2007) had of the opinion that in spite of all the efforts in reviving bureaucracy in the context of new public management, bureaucracy is getting worse. But I believe that any changes in bureaucratic behavior and norms are to adapt to the changing scenario only to be intact as a superior class in the society. Bureaucracy has tremendous impact on public good and services essential for citizens' life. In case of any conflict with their political masters, bureaucracy would have a better say (Yazaki 2018). Hence bureaucratic culture will not have any threat from the side of politicians. Moreover, a fragmented political system cannot bargain properly with bureaucratic structures (Meier and Hill 2007). The real threat to bureaucratic power and culture in the future, if any, will come from the society itself, from which bureaucracy derives its cultural values. I don't see a variety of "Frankenstein's Monster" in the behavior of bureaucracy where it can engulf the society. If bureaucratic culture needs to go deeper into the society, then change is necessary. I have a strong feeling that only one change in behavior would be suffice to keep the bureaucratic culture intact. The bureaucracy needs to be more "citizen centric" and in a larger context more responsive toward the society and public service. Though this suggestion will not come alone, it has to be viewed holistically. It needs necessary changes at other fronts also and most importantly mind-set or attitude. Considerable time has already been gone since the onset of globalization worldwide. But bureaucratic culture is still there and ubiquitous. Notwithstanding the debacles faced at the dawn of globalization, the bureaucratic culture, values, norms, powers, and rules would continue in the future.

# Bureaucratic Culture, Corruption and Accountability in Sri Lanka

Ramesh Ramasamy
Department of Political Science, Faculty of Arts, University of Peradeniya, Kandy, Sri Lanka

## Synonyms

Administrative culture; Civil service; Institutional practices; Organizational culture

## Definition

Bureaucratic culture generally mirrors wider social values, and it varies from one society to another being conditioned by general societal norms, customs, bureaucrats' orientations, beliefs, and propensities which they gain through education, training, professional development, and intellectual and ideological persuasions. It prevails in every society with organized political and administrative systems, and it reflects in different forms and tends to shape the institutional environment, working, quality, and services.

## Introduction

Public administration of each country has had distinctive features in undertaking public affairs and public policy implementation which differ from one country to another. One could observe the differences in bureaucratic structure in developed nations and developing global south. It is also evident that within each bureaucracy, there exist plenty of agencies with their own peculiar features – they include central, subnational or provincial, local, etc. Instances are there where several public institutions exist under local administration such as police, tax department, hospitals, schools, and so forth with different subcultures (Claver et al. 1999). Sinclair (1989) puts forth that due to the separation between the

management (public officials) and control (policy makers), public bureaucracy is largely sensitive to political manipulations and influence – this is largely observable in developing societies where bureaucracy is more prone to changes. Thus, bureaucratic efficiency, performance, and productivity are being influenced by various forms of political manipulations, patron-clientelism, informal values, norms, and so on which become inherent ingredients of bureaucratic culture.

Therefore, it is important to understand bureaucratic culture in the developing country context and how it affects accountability and corruption. Bureaucracy is not merely a technical aspect of organizational design, meritocracy; it is also about social interventions, norms, values, culture, organizational citizenship practices, and social origin of officials. All these traits help form the bureaucratic culture and pursue them in line with institutional and personal interests. It is argued that culture of a public institution emanates from three factors: firstly, cultural orientation whether western or Asian culture (these features tend to influence bureaucracy); secondly, citizens (beliefs, social background) who are served by a specific public institution which to a large extent tend to determine bureaucratic culture; and thirdly, beliefs and social origins of public officers which encourage and transmit bureaucratic culture (Claver et al. 1999). These can be equally applied to Sri Lanka to understand how bureaucratic culture tends to influence accountability and corruption.

In Sri Lanka, bureaucratic culture is a mixture of western and Asian orientation – yet, British introduced bureaucratic values, norms, and practices, and culture continues to influence the institutional working, though there are some changes that have taken place after independence. The existing administrative system has five levels of governance structures such as national, provincial, district, divisional, and village and functions under strong centralized system. Sri Lanka is a unitary government with a mixture of a presidential and a parliamentary system. The prevailing multilevel governance structures have created certain complexities and crisis in governance spheres and administration of the country. Some existing evidence shows that current governance model in the country has created a range of issues such as corruption, politicization, low quality of governance, poor public service delivery, low level of trust, and so forth. Administrative culture (power politics, low salary, tolerance of inequality, obligations created by collective social structure, sifaries, sycophancy, and masculinity) provides reasons and incentives for corrupt behavior (Ramesh 2020). Due to delays in the development of political institutions in the post-independent Sri Lanka, the bureaucracy used the inexperience of political parties, institutions, and politicians in gaining upper hands in the governance process – this is also partly induced by colonial legacy and institutional status given to bureaucracy so that members of it developed a distinctive culture which eventually led to wicked problems in the governance including endemic corruption, elitism (elite capture), paternalism, unresponsiveness, particularism, patron-clientelism, etc. The remainder of the chapter is organized as follows: the next section presents the theoretical insights of bureaucratic culture, and third section examines the bureaucratic culture of Sri Lanka under which constitutional changes and its effect on bureaucratic culture, governance reforms and its effect on bureaucratic culture, corruption, and bureaucratic culture have been discussed followed by conclusion.

## Bureaucratic Culture: Theoretical Insights

Bureaucratic culture remains a key area of study in public administration and governance. Bureaucratic culture tends to influence accountability mechanism and corruption in general, specifically in developing countries (Claver et al. 1999). When there remains a healthy, open, and responsive bureaucratic culture, it is more likely to enrich accountability and governance quality. In contrast, if the bureaucracy lacks openness and pursues the idea of secrecy, it is more likely to create an institutional environment in favor of

corruption, elitism, and unresponsiveness. The bureaucracy remains a key source of inputs into the policy process, and its dominance over state affairs stemmed from a unique ethos that nurtured elitism, conservatism, and inertia. Bureaucrats were highly motivated to advance their power and authority in the command structure and to maintain their social prestige and esteem. Some of specific features of bureaucracy in terms of work norms, practices, powers, social background, status, and all transformed the bureaucracy into a self-regulatory institution largely insulated from political control. At the same time, the contradictions between the value patterns of the bureaucracy and those of the political elite in the opposition camp sharpened (Zafarullah, 2013:933) – the distinctive cultural practices maintained by the bureaucracy, in most cases, paved the way for confrontations between political administration and public bureaucracy. When Weber 1968/1978 introduced positive characteristics of bureaucracy, he did not expect that they will result into a specific culture with negative features including inefficiency, corruption, inflexibility, particularism, favoritism, etc. While bureaucratic culture remains a common feature in public institutions, it also in most cases manifested through subcultures as well. Specific interest, own interest, specific language, value system, and beliefs all reflect bureaucratic culture (Aucoin 1991; Bate 1990). In certain cases, ethno-religious and caste ties also tend to influence in forming bureaucratic culture which is quite visible in many South Asian countries including Sri Lanka, India, and Nepal. When various ethnic, caste, religious, and linguistic groups come into public bureaucracy, they will on the one hand mirror and pursue the common culture of the organization, and on the other hand, they will also reflect their own identity affiliations as part of bureaucratic culture – this eventually becomes very powerful element of institutional working, service delivery, and decision-making. Importantly, Kono (1990) confirm that bureaucratic culture is usually detrimental to innovation process and any kind of changes – it is largely prone to traditional working patterns, procedures, rules, regulations, and so forth.

Bureaucratic culture prevails in every society with organized political and administrative systems, and it generally mirrors wider social values, obviously varying from one society and another being conditioned by general societal norms, customs, customs, bureaucrats' orientations, beliefs, and propensities which they gain through education, training, professional development, and intellectual and ideological persuasions (Zafarullah 2013: 932; Hendryadi and Budi 2019). The bureaucratic culture is also shaped by its structure, authority relationship, rules, and procedures. In other words, the concept can be defined as configurations of behavior which reflect through distinctive values, beliefs, assumptions, sentiments, orientations, and attitudes shared by members of a bureaucracy (Waldo 1965; cited in Zafarullah 2013: 932). The generic characteristics of the bureaucratic culture are: relatively authoritarian management style, a high degree of control, top-down communication, search for individuals' stability, limited initiatives, and centralized decision-making (Claver et al. 1999). Taormina (2008) has found that leaders tend to be more control-oriented in bureaucratic culture. This indicates that the bureaucratic culture is in line with the behavior of control-oriented leaders. These characters are not determined by the technical task assigned to members of bureaucracy but by the political and social forces operating within the public bureaucracy (Wilson 1993). "While societal and political cultural factors shape the mind-set of bureaucrats and define the relationship of the bureaucracy with the political structures and the general public, the interplay between this relationship with the internal operational forms and organizational dynamics of the public administrative system actually determine the nature of bureaucratic culture" (Zafarullah 2013: 933).

As argued above, we should also note that no bureaucratic culture is monolithic; instead, it is a part of the wider culture of a society including its constituent parts such as political, economic, social, religious, corporate, and civil society cultures. In developing countries, it is the political culture that influences the bureaucratic culture most because it brings its political values to

modulate the behavior of state employees – ethno-religious politics (ethno nationalism), caste politics, and electoral competition all tend to influence bureaucratic culture in numerous ways. Finally, the culture of the bureaucracy is sometimes supported, sometimes challenged, by two important subcultures: first, the culture of each department or agency of government, with its own mandate, interests, client groups, and major professional and occupational components; second, professional subcultures, such as those of accountants, lawyers, economists, engineers, diplomats, and scientists that cut across organizational boundaries. A composite bureaucratic culture then reflects the values of all its constituent parts (Dwivedi and Gow 1999).

According to Dwivedi and Gow (1999), there are three main approaches to studying the bureaucratic culture of a nation:

1. **Deontological approach**: deontology is the study of duty and ethical/moral obligations of human beings as well as of the organizations they represent. By using this approach, one could focus on the ethics and morality of the bureaucrats.
2. **Teleological approach**: the teleological approach is based on analyzing the success of a decision in producing a desired effect. While still in the realm of the desirable, this approach pays much more attention to intervening realities on the path to realizing goals or respecting values. The teleological approach also concerns the causal relationship between means and desired ends.
3. **Spiritual approach**: when we refer to spirituality, we generally mean a kind of energy source that (a) is beyond ourselves and transcendent; (b) impels us to search for the purpose of life here and after, as well as why are we here on earth; (c) has an overarching influence on our sense of right and wrong; (d) empowers us to care for others; and (e) inspires us to act for the common good. It should be noted that these three approaches are based on some common values such as fundamental rights and freedoms, efficiency, accountability, fairness, etc.

## Bureaucratic Culture in Sri Lanka

The British colonial legacy and the patterns of government administration in postcolonial Sri Lanka have significantly influenced the cultural makeup of the bureaucracy. The then Ceylon Civil Service and currently Sri Lankan Administrative System continue to maintain the Oxbridge tradition, though there are changes that have taken place with the introduction of Sinhala Only Act of 1956 which imposed the Sinhalese language spoken by the ethnic majority as the official language of administration of the country, simply denying language rights of ethnic minorities who account to 25% of the total population. This eventually became a key factor for ethnic conflict. With the introduction of the above law, the bureaucratic culture significantly changed the demographic composition of the bureaucracy. As a result, Sinhalese language became dominant in the administrative process, and a large number of Tamil-speaking public officials left the civil service as they could not continue their work in Sinhalese language. During the colonial period, English was the official language of civil administration. The change of language of administration created a mono-ethnic and linguistic bureaucratic culture in Sri Lanka which lasted until making the Tamil language also an official language of administration in 1987.

Like other postcolonial developing societies, Sri Lanka was bestowed a bureaucratic apparatus founded on the Weberian style and procedures that conflict with prevailing indigenous societal values and norms and, therefore, unable to cope with the demands of the community it serves. The degree of incongruity between norms and realties is fairly high; what is actually prescribed often remains unenforced and unfulfilled. Importantly, laws made with good intentions and based on apparent sound reasons are forsaken because of bureaucratic failures or partisan demands or narrow-vested interests. The post-independent Sri Lanka's Administrative Service failed to abandon the ingrained cultural traits acquired through the internalization of values from the past and the contemporary societal environment. In fact, the bureaucracy acquired new characteristics that

reflected prevailing social, political, administrative, and economic realities. As such, structural and procedural changes to the political-administrative system, the transformation of the public sector, severe competition for civil service positions, economic liberalization programs, the growth of the private sector, growing unemployment, fall in real income, rising poverty among the masses, increasing delinquency, the primacy of the black market economy, unproductive government spending, and social degeneration have resulted in significant changes in the bureaucratic value system (Bandara 2013; Ramesh 2020). As stated earlier, the transition from colonial bureaucracy to national bureaucracy was not properly addressed by the national leadership during 1931–1948. However, the common class and elite outlook shared by both the political and the administrative leaders and the continuation of most of the public policy strategies established during the colonial period had facilitated a good working relationship between the politicians and the bureaucrats. But this tranquility did not last long. Yet, the bureaucracy maintained the elite nature; therefore, there was a lack of links between society and bureaucracy. During the change of governing regime and the introduction of somewhat "radical policy changes" in 1956 (language policy), the country drifted toward a period in which tension between the political leadership and the administrative leadership became a visible feature. The tension between the administrative and the political leaders produced a conflict between new political leaders and the leaders of the public bureaucracy. The allegation of non-corporation by the administrative leadership was leveled against the public servants by the political leaders. The constitutional protection provided for the bureaucrats was identified as one of the obstacles for the political leaders to fulfill people's aspirations – the former helped bureaucrats to form a distinctive culture within bureaucracy.

Yet, subsequently, the constitutional protection for bureaucrats was removed in the new Constitution adopted in 1972. Though the post-independent constitutional changes targeted at the public administration envisaging greater political control over the bureaucracy, these changes did not address the real issues confronted by the administrative system. The postcolonial state was to take up nation building and national development as its key objectives, while the public administrative system needed certain technical and cultural capacities to undertake the tasks associated with these twine objectives. One such need was to move from procedural-oriented centralized bureaucratic system to development-oriented decentralized bureaucratic system. Though the requirement was to establish a development administration which means "development of administration" and "administration of development," the system went toward the politicization of bureaucracy. The Second Republican Constitution of 1978 continued the process of politicization of bureaucracy, and it was taken to its height under the presidential system (Ramesh 2020). The politicians engaged in administrative business and bureaucrats doing political business became the hallmark of governance process. The final outcome is the creation of an administrator subservient to the politicians in power. This has created a "bureaucratic imbalance," i.e., the administrators failing to stand between the positions of "despot and subservient" (Bandara 2013).

## Constitutional Changes and Bureaucratic Culture

The existing evidence shows that constant constitutional changes and amendments to the constitution seem to have some effect on bureaucratic culture. Thus, changes in governance structures in Sri Lanka after 1970s can be understood in terms of the political system that underwent major changes over time, specifically in 1972, 1977, 1987, 2001, 2010, and 2016. The constitutional changes of 1972 brought the administrative system under the direct management of the political executive at the center. The First Republican Constitution abolished the Public Service Commission (PSC) established in 1948 and handed over the powers of the public service to the Cabinet of Ministers which received the constitutional protection under "parliamentary sovereignty," entrenched in the new Republican Constitutions.

New constitution established the Public Service Advisory Board and the Public Service Disciplinary Board to replace the PSC (Somasundaram 1997). The constitutional changes of 1978 introduced an executive presidency that derived its legitimacy through a countrywide election, and system of proportional representation came into force under the very constitution conferring advantages on small political parties. Consequently appointment of leaders of the administrative system became the constitutional function of the President who now appoints the Secretary to the President, the Secretary to the Cabinet, and Secretaries of the Ministries and Chief Secretaries of the Provincial Councils.

The third constitutional change, which emerged from the 13th Amendment to the Constitution in 1987, sought to introduce a devolved political system. It was a response to satisfying political aspirations of the minority communities for a greater voice in the management of their affairs in governance. However, ineffective devolution has resulted in devolved structures having to cope with processes designed for a centralized system; therefore, effectiveness of multilevel governance structures came under daunting challenge. Sri Lanka has to go a long way to achieve real benefits of multilevel governance in terms of efficiency, cost-effectiveness, and citizens' satisfaction. There shall be some criteria to assess the performance of these changes using conceptual frameworks such as "centralization and decentralization continuum"; "politicization of bureaucracy", "imbalance in resources transfer" and "stability, allocation and distribution functions". At present, there exists a provincial government with the separate bureaucratic structure largely influenced by central government bureaucracy – these provincial bureaucracy has some specific cultural traits owing to regional variations, politics, ethno-religious composition, and caste, in addition to common cultural features.

Interestingly, with the introduction of the system of proportional representation in the present constitution (1978), the elected public servants have made their presence very much visible in the area of policy implementation. Theoretically, policy implementation involves a series of management activities following on policy formulation, and the former is considered to be domain of appointed or selected public servants who are career professionals, though the executive arm of the government is headed by elected representatives. However, the direct intervention of the latter in policy implementation amounts on leaning administrative process (Gammampila 1997, p. 319). It is argued that political control of administrative process is necessary because political leaders are directly answerable to citizens, especially in the matters of development and welfare provisioning. Failure or ineffectiveness of the legislative policy implementers-public officials also forced elected officials to intervene in matters related to service provision which is a new development in governance structures in Sri Lanka. This results in conflicts between public servants and elected public servants on the role in implementing public policies. This pattern leads to undue political influence and politicization in policy implementation process – this pattern not only affected the bureaucratic culture but also enabled political actors to use public power for vested interests (Gammampila 1997, p. 319).

The 17th Amendment to the Constitution in 2001 led to the fourth constitutional change. It set up the Constitutional Council to restrain the almost unfettered discretion of the President in making key appointments, such as judicial appointments (ADB 2007, p. 3). Moreover, it changed the character of seven important public institutions: (i) Public Service Commission, (ii) Judicial Services Commission, (iii) National Police Commission, (iv) Elections Commission, (v) Human Rights Commission, (vi) Commission to Investigate Allegations of Bribery and Corruption (CIABC), (vi) Finance Commission, and (vii) Delimitation Commission. The appointment of each of the Commissioners to these Commissions is still made by the President but must be made only upon a recommendation of the Constitutional Council. These Commissions, which were constitutional commissions, are directly accountable only to Parliament.

Nevertheless, the 18th Amendment to the Constitution introduced in 2010 became highly controversial and put the governance structures of the

country in peril and the liberal democracy at crossroads. The amendment removed President's term limit and brought the public service under the direct control of President, and the Constitutional Council which was established under the 17th Amendment was abolished and replaced with an impoverished parliamentary council to make recommendations to the president on key appointments. This further enhanced the powers of President and paved the way for highly centralized system of governance through which politicization and corruption became endemic in bureaucracy. As a result, patron-clientelism took precedence over meritocracy in governance, and the former was often sacrificed in order to favor someone, thus giving rise to the problem of institutional legitimacy. Wood argues that patron-clientelism flourishes leading to rent-seeking, nepotism, cronyism, arbitrariness, and secrecy (2000, p. 222), and Jamil et al. (2013) show that in South Asia political interferences in administration are common and since merit is not the major criteria for career enhancement, public officials resort to lobbying and showing political allegiance to further their professional career.

One of the distinctive features of bureaucratic culture in Sri Lanka is "clientelism" or patron-client relationship that existed in almost all spheres of public bureaucracy. It is a form of asymmetric relationship, but mutually beneficial relationships of power and exchange of material and other gains, and also a non-universalistic element of bureaucratic culture. In consequence, bureaucrats tend to compromise legal-rational authority as they are entrapped in clientelism – decisions are subjected to personal negotiations, bargaining, and policies and rules that are twisted to satisfy family and community obligations. In such occasions, bureaucrats will have to adhere to informal orders and connections than formally stipulated roles. This culture apparently subverts the notion of impartiality and impersonality expected to be pursued by bureaucrats – this in turn creates a new culture within bureaucracy regulated by clientelism. Patron-clientelism may help maintain social and family relationship, informal networks, patronage system, etc. But their implications are extremely high on bureaucratic ethics and ethos and subsequently citizens' trust in public bureaucracy. Sri Lanka's administrative system remains rigid, inflexible, and unresponsive to citizen's needs – so that public tend to use personalistic networks to get done the business whereas poor and deserving people expect bureaucrats to apply rules and regulations impersonally adhering to the established procedural justice. It can be argued that patron-clientelism tends to distort the idea of legal rationality in a formal bureaucracy. The 20th Amendment to the Constitution passed in 2021 has given sweeping powers to the President to intervene in public bureaucracy – as a result, top-level executive positions are being given to military personnel. Therefore, it is more likely to distort age-old civil service administration established during the colonial period and may create conflicts between military administration and civil administration. As the President is coming from military background, he seems to have more trust in military personnel than that of civil servants – this pattern will significantly affect bureaucratic culture of Sri Lanka hitherto maintained including citizens' trust.

It is also possible to argue that in the Sri Lankan bureaucracy, egalitarian sentiments are not clearly reflected in the behavioral mannerism that bureaucrats display in real life, and they maintain a distinctive culture which is insensitive to citizens' needs and demands – class differences, elite capture of bureaucracy, and individualism all tend to preclude officials to pursue egalitarian ethos in an evenhanded manner. Zafarullah (2013) argues public officials respond only when they have something to gain from the service they offer to individuals or groups. Specific instances and encounters by particular groups also highlight attitudinal problems in the bureaucracy. This has caused a decline in the level of people's trust and confidence in the administrative system in providing basic services to the community. It is observed that Sri Lankan bureaucrats are more likely to maintain their status quo, and they have fear over modernization as it may dismantle their status and privileges. In other words, if any form of reforms tends to work against their interest and privileges, they are unlikely to accept them.

Moreover, in the Sri Lankan case, the type of political regime and poor performance of political leadership have made the bureaucracy unaccountable, unresponsive, and corrupt. This is consistent with what Zafarullah argue (2007: 166); bureaucrats consider their role as critical in governance, and this is engendered by their perception of themselves "as the highly specialized exclusive source of policy advice and guidance for the government with 'proven' experience and proficiency in accomplishing policy goals." One could argue that the incongruity between the bureaucratic and political value systems in Sri Lanka manifesting itself after independence of the country led to the distancing of the bureaucracy from the political arena, essentially to neutralize its power. This further explains that effective political control over bureaucracy is essential to neutralize its power and make it responsive, effective, productive, fair, impartial, incorrupt, and accountable to citizens' needs and demands, which is largely lacking in Sri Lanka.

## Governance Reforms and Bureaucratic Culture

Several efforts have been taken to reform the bureaucracy since the independence to enhance performance, transparency, and accountability and to fight corruption, though it is not much successful. Such changes also targeted changing negative aspects of bureaucratic culture over citizen's needs and demands. As the evidence shows, civil servants' attitudes toward ethics, integrity and accountability, responsiveness, and actual behavior at work and in their dealings with citizens provide an interesting dimension of bureaucratic culture. These are important ethos of bureaucracy and cannot be compromised, and this demands Weberian ideals among public officials. Ethics justify actions and decisions impartially and objectively made in an administrative setting, help uphold accountability, promote integrity, and challenge dishonest behavior. When public servants exercise their public power, they are required to honestly, responsibly, and fairly serve the people and to be accountable for their actions. Yet, in Sri Lanka, there has been rapid erosion of bureaucratic ethics – public officials evading their responsibility, self-indulging, underperforming, misusing public power, corrupting, and promoting particularism. There exist greater resistance and delays for reforms – such efforts demanding accountability, innovation, efficiency, effectiveness, and responsiveness to citizen's needs are either prevented or unlikely to be implemented.

Thirty-three years after the creation of the Sri Lanka Administrative Service, a draft Memorandum of Understanding between the Minister of Public Administration and the Asian Development Bank was signed in 1995 and it stated that:

> At one point Sri Lanka had a strong and effective civil service. When the country became independent, the administrative system had to diversify away from the essential functions of maintaining law and order and takeover more complex developmental tasks. In doing so, however, the civil service preserved its high professional tradition and therefore was well respected. A career in the public service retained a cachet it had enjoyed earlier and continued to attract talented persons. Unfortunately, though, in time the independence of the bureaucracy was undermined, its strength shaped by inter-service rivalries and differences, and its quality eroded by a steady lowering of entry standards. Many of its members are also inadequately trained for new responsibilities. As a result, the Sri Lanka public service today is not well equipped to perform its role. (Somasundaram 1997: 340)

Despite these drawbacks, the 1978 constitution and consequent governance reforms helped widen the scope of governance, and the NPM-inspired reforms (in the 1970s/1980s) provided the avenues for private sector and civil society actors to engage in governance – for instance, public-private partnership and open government partnership, to name a few. Globalization and primacy of economic growth further necessitated the state-private sector-civil society partnership. Highly centralized administration based on strong hierarchy started changing over the years, due to the constant intervention of international and multilateral agencies in setting policy agendas – this includes WB, ADB, IMF, and other major donor agencies. Yet, in terms of economy, still state's direct intervention continues to remain (see

**Bureaucratic Culture, Corruption and Accountability in Sri Lanka, Table 1** Public bureaucracy of Sri Lanka: structural changes

| 1833–1972 | 1972–1977 | 1977 to date |
|---|---|---|
| Colonial bureaucracy | National bureaucracy | Continuation of national bureaucracy with liberal policy options (widening scope for other actors –private and civil society) |
| More government and less governance | Overcentralization of governance | More governance and less government |
| Strong bureaucracy-based strong hierarchy | Paternalism in public policy process | NPM-inspired reforms and policy transfers by international agencies |
| Regulated economy | National economy and direct state intervention | 1977–1994 – deregulated economy<br>1994–2005 – deregulated economy with a human face<br>2005–2015 – nationalistic liberal economy and state's direct intervention<br>2015–2019 – deregulated economy<br>2020 onwards – nationalistic economy with state control |

Table 1 for more details), and it has resulted in paternalism, leading to patron-clientelism policy making and implementation. Table 1 illustrates the changing dynamics of governance in Sri Lanka based on different time periods and its salient features.

In 2015, there was an important shift in Sri Lanka's political history – in the very first time, two major rival parties (United National Party and Sri Lanka Freedom Party) came to an understanding to form a national unity government in 2015 to ensure good governance and fight corruption. The government itself came up with several policy and institutional measures to eradicate corruption and improve governance. The constitutional amendment widely known as 19th Amendment became instrumental during this period in improving governance, though it was not effectively materialized and abolished in 2021. Since the introduction of the 1978 Constitution, as of now, there have had been 20 amendments to the constitution, but it is safe to argue that this is the only amendment that helped shaping governance of this country through drastically reducing powers of President in the affairs of public service, by establishing independent commissions, the Constitutional Council, and the Right to Information Act. Despite these positive changes, high profile corruptions also took place during this period – the so-called "Central Bank Bond Scam" which has been seen as one of the biggest scandals in the Sri Lankan history happened shortly after the good governance government came to office (2015); therefore, despite these reforms, the then government could not do much in terms of improving governance quality.

The most acclaimed aspect of the 19th Amendment is the enactment of the long awaited Right to Information Act – Sri Lanka was the most delayed nation in enacting RTI in the region, though it was regarded as model democracy in Asia. Now it is almost 4 years since its implementation, the act continues to stand as an example of transformative impact of progressive and pro-citizen legislation, despite persisting challenges. The RTI Commission provides an immense contribution in implementing the act amidst limited institutional capacity. It has made progressive orders regarding citizens' crucial demands and information and asset declaration of senior politicians – hundreds of thousands of ordinary people have been benefiting out this legislation in a variety of manner. Yet, it is too early to make an assessment on the impact of these changes in bureaucratic culture.

Nevertheless, Sri Lanka's RTI is considered as one of most powerful acts in the world – the Canadian Centre for Law and Democracy, which carries out RTI rating, has ranked Sri Lanka's RTI

in third place in 2017 and fourth place in 2018 out of 80 countries. This evaluation is largely based on content of the act, not on implementation. According to Toby Mental, Sri Lanka's RTI law presents a very impressive package of responsibilities and powers which places the RTI Commission of Sri Lanka among the most powerful in the world (2019, p. 82; Gomez 2019, p. 15). The very law provides greater avenues for citizens to access a range of information held under the custody of public institutions subject to certain limitations, and the very legislation helps changing the long-standing culture of secrecy in public institutions. However, without a functional democracy, right to information may remain a mere rhetoric reflecting symbolic politics. It is therefore argued that the successful implementation of RTI relies on the extent to what democratic principles are upheld in a country including political and bureaucratic willingness and commitment.

## Corruption and Bureaucracy Culture

Empirical evidence indicates that Sri Lankans bribe public officials and politicians for three main reasons: (a) to receive a service entitled to, (b) the bribe was paid to avoid a problem with the authorities that provide various services, and (c) the bribe was paid to speed up things. Interestingly, more than 50% pay bribe to speed up the things. According to the Global Corruption Barometer for Sri Lanka 2019, only around 47% seem to have trust in government, which means half of the respondents unlikely to trust government. Some 80% considers corruption with the government as being a very big problem. This survey indicates rapid increase of corruption in climate change, natural resource utility, and disaster management – around 51% of the respondents tend to believe that corruption is rampant in these sectors (TI 2019) – this is a new development in Sri Lanka where large-scale scandals take place in environment and natural resource management with the support from political leaders and public officials, and it has now gained immense attention as Sri Lanka has become a disaster-prone country in the past. The survey reasserted that corruption has become a permanent feature in public and political institutions and a way of life among poor segments of society where they have to bribe officials to get what they ought to obtain – poor people tend to experience indifferent treatment if they fail to bribe which is visible in needs -tested selective welfare programs such as poverty alleviation, social security benefits, housing, etc.

Further, family- and kinship-based bureaucratic culture has given rise to the culture of *Sifarish* in developing countries which remains extremely high in Sri Lanka due to paternalism. Paternalism is deeply rooted and imposes a cross-cutting effect in all forms of governance due to the long-standing influence of family, kinship, ethnicity, caste, region, and nationalism in politics and administration. This Urdu word *Sifarish* literally means a recommendation or an informal lobbying. In some ways, it resembles the Sri Lankan system of *Anumathakirima* (*anumathi valanguthal*) short of straight bribing; it has become the standard means of getting things done by public officers (Islam 2004). In Sri Lanka, political leaders and top-level bureaucrats are invariably involved in the Sifaries game, rule-breaking, corruption, and shady wheeling and dealing. Public services that should be provided to the citizens are procured through Sifarish so that in many instances citizens are being unfairly treated when tend to get legally mandated public services. Getting jobs, getting promotion, getting transfer, getting license, renewing a driving license, getting clearance in customs department, and getting a telephone connection and admission to school all visibly need Sifarish. School admission is an avenue for rampant corruption – the allegations included bribing principals, seeking informal lobbying from politicians and educations directors, roping in intermediaries at high cost, and nepotism and mandatory "donations" to schools and school development societies (Transparency International 2009). Often Sifarish is used to pressure the decision-maker to take an inappropriate or illegal action. It involves finding a relative or a close friend who knows the functionary or has some influence to get the job

done. In rural areas, access to water, electricity, sanitation, health services, and road could all be procured through Sifarish. It makes a mockery of any rational system of service delivery based on rational criteria. The decision-makers who feel compelled under family and kinship pressure to oblige their clients bend and break the rules. Those who do not play the Sifarish game earn a bad reputation or even get labeled with different names. This explains how influential Sifarish is in the developing countries.

Similarly, there is another term which is also quite popular in Sri Lanka including some South Asian countries – that is, "*sycophancy.*" Corruption researchers in the South Asian background often use this term. Sycophant can be defined as a servile person who acting in his or her own self-interest attempts to win favor by flattering one or more influential persons or by saying lies against a fellow citizen for gaining a kind of profit (Islam 2004). In the Sri Lankan society, for a person in high position, personal achievement will be given more credit. Therefore, most of the subordinates adopt a supposition-based process to make out leadership for getting jobs, getting promotion, and getting transfer. This situation leads to administrative corruption in the public sector. An interesting point was that personal connections were considered more effective than bribes to get transfer. Nepotism and favoritism were alleged as the most common form of corruption in transfers rather than the exchange of money (Transparency International 2009). These are entrenched in the bureaucracy in Sri Lanka and have become normal way of doing things, not exceptional.

## Concluding Remarks

According to Hofstede (2005), culture is a programing of the mind that distinguishes the members of one category of people from those of others. In Sri Lanka the bureaucracy is one such cultural entity. It clearly has distinctive behavior, attitudes, institutional working, norms, values, and practices which are shared by public officials and will reflect when they fulfill their roles and responsibilities. Within the bureaucracy, there are different organizations having separate mandates, roles and responsibilities, institutional practices, and value systems. Each of them has their subcultures. The employees belong to any of the public institution, either exclusive to the agency or cutting across agencies like the Sri Lanka Administrative Service; they pursue different and common forms of culture within the bureaucracy. Culture is not inborn but acquired from the environment in which the person is located or employed. For instance, an employee newly recruited to an organization acquires culture, and if it is by nature already ineffective and corrupted, the newly recruited person would become accustomed to the existing system. As found in Sri Lanka, bureaucratic culture tends to shape accountability, responsiveness to citizen's needs, integrity, impersonality, openness, and so forth. From the existing evidence, it is possible to argue that most of the developing countries tend to share some common features of bureaucratic culture which are different than that of developed nations' bureaucratic culture. Yet, one could also clearly observe some specific and context-oriented cultural practices in bureaucracy.

# Bureaucratic Dysfunctions Through Black and White Lens, Film Review of the Modern Times and High Noon

Andrea Ramos
Florida Atlantic University, Boca Raton, FL, United States

## Synonyms

Abusive supervision; Abusive supervisory behaviors; Bureaucracy and Alienation; Change cynicism; Exhaustion; Feelings of ineffectiveness; Frustration or cynicism; Lack of enthusiasm and motivation; Reduced efficacy; Stress

## Introduction

Motion pictures have depicted public service and public servants' roles throughout the years. The government's characterizations as a hero or a villain expose various elements of any given bureaucracy, such as its attitudes, fears, anxieties, and hopes. The films Modern Times and High Noon reflect on many criticized aspects of a bureaucratic type of government. Even after many decades, we can observe the resemblance of the continuing challenges and controversies faced in the public sector in these films. With this in mind, films' relevance based on criticism of government dysfunctions will always be immortalized by mirroring images of failure of public service delivery.

The art of capturing a period through filmmaking has certainly been precious to those interested in learning history. The changes in technological advances are notorious, but through films, we can observe the essence of a society and its government at a particular time in history. Modern Times and High Noon pertain to different periods; the former is a silent comedy based on the Great Depression, and the latter a 1950s American Western film. Both films are highly relatable to our present time concerning the meaning and

value given to the public sector and government role and the influence of public opinion. Significant issues and events are portrayed in both films, addressing ethical and unethical behaviors, managerial and leadership styles, and labor relations. Dysfunctions of bureaucracies such as red tape, lack of communication between units, and alienation are depicted in the scenarios of unacceptable work environments, feelings of powerlessness and normlessness, and employee burnout. De Jong (2016) explained bureaucratic dysfunctions in the public sector as intellectual and practical challenges mainly due to the assertions of their performance being often incomplete and contradictory.

Scholars have used film and media to study and understand the antagonism against government, including the attacks on pension benefits, job tenure, and public employee union representation (Kass and Catron 1990; King and Stivers 1998; Mastracci 2011). Although the plots in both films differ by being comedy and drama, they deliver compelling messages through metaphors and references that enhance the meaning of the government's function and the public servants' role. In the field of Public Administration, both films allow for further analysis of theories based on reform and public service motivation. The former is based on reform and reorganization of governments' administrative structures (Peters 2002), and the latter is focused on human motivation related to workplace behavior (Mastracci 2017).

## Modern Times

This silent comedy transmits more meaning than words could ever express. Charlie Chaplin portrays the main character, the Tramp. Through irony, humor, and despair, it takes us for a ride during the Great Depression, reflecting on the working class' economic struggles in a capitalist economy after the industrial revolution. The earlier part of the film shows various unethical working conditions, dehumanizing laborers daily by the hard-working needs and treating them like machines. This type of dehumanization is a clear portrayal of Marx' alienation caused by modern capitalist organizations, where bureaucracies are characterized by "division of labor, work standardization, and impersonalization" (Farazmand 2002, p. 23). With this same plane of thought, alienation is observed through the factory workers' relationship with management and their value within the organization. The concept of lack of identity and belongingness leads to the workers becoming clogs in the machine owned by outsiders.

Great attention is given to the portrayal of the interactions and dynamics within the assembly line. Details are enhanced, and in some cases highly exaggerated, to highlight the dysfunctional management style that mainly focused on efficiency, productivity, profitability, and competitiveness. Moreover, management is depicted as controlling and abusive, disregarding the workers' rights, comically displayed by Charlie's constant and repetitive, monotonous actions. These dystopian working conditions are heightened when the main character attempts to do any human-like activities and is immediately called to attention by the upper management's continuous surveillance, consequently, leading to low morale within the assembly line, negative work satisfaction, and poor job performance among employees. The film does a great job in clearly portraying cause-consequences scenarios rooted in the organization's disregard to the worker's needs and focusing on minimizing costs and efficiency maximization. Ultimately, these factors negatively affect the workers' physical, mental, and psychological well-being and further contribute to social dysfunctions inside and outside their organizations.

The dramatic depictions of the lower-class worker's experience can be comical yet serious because the situation is not too far from reality. Issues derived from capitalism and hierarchical systems are reflected as discrimination, power of abuse, social and economic disparities, and other systemic social problems. Perhaps some issues are more meaningful by their symbolic representation, for example, the earlier scenes of sheep being herded with people (workers) when leaving a subway station to portray humans as a piece of machine conceptualized as the sheep's value to produce wool. Similarly, the factory's large clock

represents the high value for outcomes, the lack of value for workers, and maximization of time-costs versus minimizing the human experience. Moreover, the scene where Charlie gets swallowed by the machine illustrates contrasting meanings beyond the human mistake. One possible interpretation is that a worker is destroyed by the organization when making the wrong move due to being consumed by exhaustion and stress.

Another facet begins with social injustice and chaos when Charlie becomes a union leader and engages in riots, protests, and strikes, leading to his incarceration. Ironically but at the time of his release, Charlie expresses not wanting to leave prison because being imprisoned was a dream compared to his experience as an assembly line worker. The enactment of the struggles and stressors of the working during the Great Depression was characterized by demeaning attitudes by society toward the working class, where human mistakes and accidents were highly criticized and condemned. Therefore, chaos, inequities, and injustice contribute to higher unemployment rates, more crimes, and more poverty. These scenes depicting society's reality from over eight decades ago are not too far from our current truth and are also highly relevant to many theories from organizational behavior. This film is an eye-opener to how more than 80 years later, we continue to seek ways to improve ethical practices, management relations, diversity, inclusion, and fairness in the public sector.

## High Noon

Gary Cooper's film the High Noon is an American Western film that takes place during the 1950s. Compared to Modern Times, it is more straightforward and touches more in detail aspects of a public servant's role. Like our current reality, the government's leadership has a high priority on protecting its citizens from threats, such as the COVID-19 crisis or national security matters. Therefore, the High Noon provides basic yet fundamental leadership, management, and justice concepts, studied by organizational behavior and more broadly in Public Administration.

One of the essential concepts and ideas highlighted in this film is the role of a public servant. Marshal's main character symbolizes a solid and well-grounded public servant that puts duty and responsibility before anything, including his personal love life and family. His strong-willed purpose as a public servant to protect and serve the public at all costs characterizes his commitment to his leadership role. He would rather safeguard the citizens even at the expense of putting himself at harm or potentially losing the love of his life. Therefore, this character portrays the qualities of many public servants that stand up for the principles of fairness and truth, but doing this might come with consequences when faced with obstacles from those that do not practice the same principles. In the film, Marshal's obligation to serve surpassed the fear of confronting a criminal, standing on the conviction of his duty to protect and serve the public. He was not intimidated by the collective fear and disloyalty from other public servants and refused to be manipulated by those threatening to cause disorder and chaos.

Marshal's relationship with the town was depicted as optimistic, friendly, and trustworthy; preserving law and order in the town inspired admiration and respect. Unfortunately, the town's support and solidarity would not be shown when trouble or intimidation threatened public safety. Anticipating disruption and chaos, and due to the lack of public service personnel available to protect the town, Marshal attempted to recruit members outside of the public organization to address the threat to the town's safety effectively. These resulted in a lack of citizen participation and support based on fear and intimidation. Even though Marshal's rapport with the community had been positive and supportive, the citizens' skepticism toward the government's capabilities developed negative public opinion and a lack of public support toward the government. This situation illustrates the ethical dilemma of a public servant seeking ways to protect the public. The disregard from the public itself to be involved and participate in the town's safety could make it easier to walk away and not care about the collective welfare. Moreover, future demands to the government to serve the public in their best

interest, be accountable, and participate with the community are affected when the public does not work together, and possibly transparency is affected and collaborative decision-making processes. Another critical illustration of the film was the organization's members' lack of participation, reflecting the hardships public servants experience from lack of government support, budgets, resources, and lack of personnel. Ultimately, standing up to the threat (obligation, duty, deadline, and responsibility) on his own, managing and getting through whatever resources are available, and being the sole decision-maker on an important decision can alter the organization's outcome.

This film does an excellent job of portraying a public servant's role committed to his principles, values, and moral obligations regardless of the threats and lack of support from inside and outside the organization. It presented ethical debates that public servants encounter and the pressure and demands of working in a public organization. The film allows us to reflect on public opinion, job performance and satisfaction, management and leadership styles, and employment in the public sector. I could not help associating Marshal's role with one of the state governors and local government leaders through the COVID-19 pandemic concerning the lack of federal government support that has contributed to a higher number of cases and deaths of citizens in different states and cities in the county.

## Conclusion

The films Modern Times and High Noon depicted public service and public servants' roles throughout distinct periods. Moreover, both films utilized different forms to convey their message, comedy, and drama. Bureaucratic dysfunctions were depicted with images of overly rigid interpretation of rules, repetitive tasks to achieve efficient production, and failure within the organization to communicate with one another, ultimately leading to workers feeling detached from the organization and each other, impeding human potential from bureaucratic alienation (De Jong 2016). While technology is utilized as a mode of high productivity and efficiency maximization, it also holds the potential of severe abuse by neglecting basic human necessities and the needs of the workers.

Despite the approach adopted to deliver each film, the messages are so powerful that after many decades we can still observe in these films the resemblance of the challenges and controversies faced in the public sector. These bring the following two questions concerning the government over time: (1) Does government shape society or does society shape government? (2) Have we learned anything from history, or will we continue the perpetual dismissal of historical events? Before answering these questions, it is essential to mention that it would be unfair to say that public servants have not improved or attempted to improve the organizational culture, eliminate injustices and unfair conditions experienced by the working classes decades ago. There are multiple regulations and acts established to protect the workers' rights and create more humane working conditions. Why, after the establishment of so many regulations, do films from decades ago still resemble challenges in today's reality? Perhaps a short and very general answer would be because the nature of being human is timeless.

After watching these films and questioning whether government shapes society or vice versa, it could be said that government and society are intertwined, but to maintain some level of stability between them, accountability, credibility, and trust are fundamental. Regardless of the period, government and public service will continue to be criticized, respected, or both, perhaps as a constant function of society shaping the government and vice versa. Whether we have learned anything from history or not will continue to be a paradox. In the public sector, we are currently faced with enhanced distrust levels in government, science, and the public sector. The multiple sources of information available to the public can be a double-edged sword when disseminating information that is not accurate and is manipulated by some. In a fast-paced world based on advanced levels of technology combined with abundant access to information available to the public, there are multiple avenues for

disseminating and manipulating information. History cannot repeat itself based on time, place, and structures. Still, the basic concept of humanization and awareness of the publics' needs is timeless and observable through time, as depicted in these two great films. I would go back to my short and very general answer and say that we can learn from history when we start focusing on the nature of being human, which is what these two films brilliantly accomplished by making them timeless.

# Bureaucratic Elites

Marcus Walsh-Führing
Department of Political Science, Universität Bremen, Bremen, Germany

## Synonyms

Classical elite theory; Democratic elitism; Modern elite perspective

## Definition

Bureaucratic Elite is a small political class with a specific material, intellectual, and moral superiority over those they govern.

## Introduction

The term Bureaucratic Elite is broadly described as a governing class that controls the organizational functioning of the state through a hierarchical structure, procedures, personnel recruitment, and behavioral compliance with the superiority of a legal rational order. The origin of the Bureaucratic Elite lies in political elites that have formed in administrative systems and have been analyzed and discussed by Gaetano Mosca, Vilfredo Pareto, Robert Michels, and Max Weber.

To describe the Bureaucratic Elite, these scholars emphasize the presence of a small political class in society that has the material, intellectual, and moral superiority to govern and that uses bureaucracy as an instrument of operational power to exercise the political and economic structure over those who they govern. This political class is unbound by social mobility and gains control of political rule through force and persuasion. The Bureaucratic Elite consolidates political rule by developing governmental structures that depend on leaders and experts in order to operate efficiently. Members of the Bureaucratic Elite gain control of funds, information flows, promotions, and other aspects of organizational functioning. To maintain political and economic influence for an inclusive group of elites by means of official positions due to the political, military, and social bureaucracy, the organizational elite is defined by specific roles in their power structure to allow the governing elite to function as a network.

This process is evident in the concept of "leadership democracy" which acknowledges a decline in the importance of parliaments in parliamentary systems as a result of bureaucratization of the state. Hence, the Bureaucratic Elite has become the access point for organized interest to lobby the Executive Branch. As society has become

dependent on bureaucracy and its elite, the state apparatus has become indispensable for providing social services and insurance to society. This dependency develops when strong governing elites are able to bring together the economic and business elites in the power structure. If governing elites are defined by weak inter-elite power structures due to competition, rivaling parties of elites are created leading to a weak relationship between the state and its citizens (Farazmand 1999).

As a result of the bureaucratization of the state, demands from society have been met through services from career professionals. The subsequent administrative growth throughout society has forced traditional elites to expand their privileged societal group to include citizens of the state. This has allowed the state to meet the demands of society through a professional, uniformed, and decentralized administrative system. Due to new administrative demands placed upon the state and the opening of society through democratization, the creation of a bureaucratic state is inseparably linked to the development of the territorial state and the capitalist economy.

The professional uniformity has created a Bureaucratic Elite under a collective authority regulated by public law while subjected to public and administrative legal constraints set forth by obligations from the Legislative Branch of government. These obligations and constraints have developed a connection between the Bureaucratic Elite and the state to form a behavior that creates legitimacy for an administrative policy preference. This legitimizing process allows the Bureaucratic Elite to centralize the state using the rule of law as its guiding principle.

## The Origin of Bureaucratic Elite

The Bureaucratic Elite has been defined as an inclusive concept that comprises both civilian and military, while, at the same time, elite theorists make a clear distinction between their roles and political influence in the power structure. Elites have the ability to maintain economic and political influences in their official positions by exercising power in the bureaucratic structure. In theory, bureaucracy functions in a top-down hierarchical structure. In this context, the definition of Bureaucratic Elite is based on two traditional definitions of bureaucracy. Max Weber provided the first characterization of bureaucracy by categorizing the political and economic developments in modern society. Weber defines bureaucracy as (1) a chain of commands (hierarchy); (2) a division of labor among subunits (specialization); (3) specification of authority (span of control); (4) adaptation of structure, authority, and rules to the organization's goals (goal orientation); (5) impersonality in executing tasks (neutrality); and (6) predictability of behavior (standardization) (Gerth and Mills 2009). Weber's conceptualization of bureaucracy lacks a description of the distribution of power and the movement of elites between different branches of the hierarchical structure. This demonstrates Weber's understanding that the bureaucratic structure is not a collective entity engaged in competition to own the means of production. As a result, Pareto and Mill further analyzed the role of elites and the institutional development through the centralization of political power and, thereby, defined the stratification of the bureaucracy between bureaucrats.

The structure among elites distinguishes between ruling, power, and governing elites. The classification is based on the distinguished roles and agendas in the interaction between elite actors that dictate their political preferences based on their level of power. Marx created the concept of the Executive Committee as an organizational network to be able to demand preferences of the ruling elite to be implemented by power and governing elites. This allows the ruling elite to develop economic power and influence in an insulated environment protected by the Executive Committee while, in turn, promoting the power and governing elite who legitimize and cultivate the economic power and interest of the ruling elite.

Pareto expanded on the concept of Bureaucratic Elite by focusing on unrestricted social mobility of elites and their ability to implement policy and persuade citizens to adapt to reform. Actions by the Bureaucratic Elite are aimed at controlling the struggle for redistribution of

capital from competing interests. The study of the Bureaucratic Elite and its actions has further led to the analysis of normative elitism and the ramifications of the reproduction of elite groups in bureaucratic structures. Pareto emphasized that the power elite is a result of the process of degeneration within democratic institutions. Furthermore, he distinguished between "governing" and "non-governing" elites and the importance of their relationships (Bottomore 1964). The result is a structural distinction between the governing and non-governing elite and society, in turn, creating status groups with different social origins. The ability to identify the bureaucrats in office demonstrates the decision-making power of the bureaucracy and the ability for the political elite to adapt to reforms. In bureaucracies, authority originates from the office of the elite, and, in a professional bureaucracy, eligibility for office derives from rank (Huntington 1964). This develops the types of roles that are bureaucratically permitted to be implemented depending on the assigned office. The hierarchy of rank allows the bureaucracy to create different functions for the elite based on specific priorities of the state.

Both intellectual thinkers, Weber and Pareto, described the Bureaucratic Elite as an authoritarian bourgeoisie who aims to centralize administrative machinery of the state to provide public services to society. The bureaucratic system places complete control in the hands of government officials through distributing political power by constraining the liberties of the average citizen, thereby challenging the constitutional rights of democracy. The aim of the Bureaucratic Elite is to protect private property and safeguard the masses from foreign political powers. In providing insurances to society, it forces the government to function in a framework based on private property.

In 1956, C. Wright Mills developed a contemporary analysis of the political, military, and business elites which are essential to the bureaucratization of governmental institutions. Furthermore, Mills created the concept of circulation of elite by distinguishing between governing and non-governing elites to develop the characteristics of the power elite. This was an attempt to conceptualize the formation of a unified elite that is the result of the relationships between "social branches." To maintain political power, elites from economic, military, and political organizations have mutually dependent bureaucratic agendas as a result of a shared agenda. To be able to implement political and policy decisions, bureaucratic elites rely on local leaders that share the same common perceptions of the world in different spheres of the bureaucracy (Mills 2000b). This social and cultural understanding creates similar values and cultural dimensions which are (1) individualism-collectivism; (2) uncertainty avoidance, relating to attitudes toward risk-taking and ambiguity; (3) power distance, concerned with attitudes toward patterns of power distribution; and (4) masculinity-femininity, having to do with the extent that dominant values are "masculine" in terms of assertiveness, advancement, and acquisition of material goods (Hofstede 1980).

## Bureaucratic Elite and Democratic Pluralism

During the first industrial revolution in the early to mid-1800s, the business elite and economic interests consolidated political power to change the social structure of society. Due to a limited number of industrial sectors, the first industrial class was able to create a homogeneous group of the elite driven by economic, social, and political agendas. At the same time, the military elite produced prominent figures among the ruling classes. As a result, the accumulation of power between the military and business elite allowed for the bureaucratization of the state to meet the demands of capitalism. To be able to counteract and defend the political and economic interests of the military and industrial elite, the Executive and Legislative Branches professionalized and trained governmental officials. Hence, to gain access to the resources of the state, the industrial and military elites created an upper social class that would allow them to shape public policy

and allocate budgetary expenditures (Aron 1950).

As bureaucratic elites consolidate power by unifying political and policy preferences, their actions have challenged the protection of freedoms and civil liberties. Furthermore, the presence of divided and unified elites creates a dilemma for the development of freedom in society because their consolidation of institutional power challenges the concept of checks and balances in the political system. In a pluralistic democratic society, competition for power has altered who controls which level of government (Mills 2000a). In the post-World War II era, the access to political positions of national power was limited to three elite groups: "corporate rich," "warlords," and members of the "political directorate." The limited access to national power created the three C's of elite theory: "group consciousness," "cohesion," and "conspiracy" (Meisel 1958). These three concepts allowed the bureaucratic elite to monopolize the position of power while, at the same time, normalizing forms of politics that are at the foundation of democratic institutions.

To further illustrate the role of the Bureaucratic Elite, studies demonstrate the division of departments and agencies and how they shape public policy (Moore 1979). For example, in the United States, research shows that the national elite constructs "central circles" of influence and power (Moore 1979). These "central circles" are at the foundation of the development and behavior of power in a liberal democracy as documented by the "Bush Elite" and the cultivation of future members of the elite by universities to adapt to a globalized world (Higley and Burton 2006). To compete in a pluralistic society, the "New Elite" consolidates its power through financial capital and the lobbying of government, hence expanding on Dahl's classification of elites by adding financial leaders as a part of the oligarchy (Murray and Scott 2012). These financial leaders have been categorized as managerial elite as a result of powers given to them by shareholders with personal interests in companies. This characterization of elites contributes a new dimension to the differentiation between elites who are managers and shareholders of companies (Hilferding 1981). Furthermore, expansion of the oligarchy allows the Bureaucratic Elite to expand its policy expertise and network to consolidate power and legitimacy.

## Bureaucratic Elite or Oligarchy

Power elites utilize bureaucracy as an instrument for operational power to maintain the power structure for the ruling elites. This monopolization of power leads to the forming of oligarchies and, thereby, contradicts the understanding of a pluralistic society. Furthermore, the Marxist critique has defined the power elite through structural analysis (Domhoff 2006). On the contrary, critics of the power elite define it as static and apolitical, thereby neglecting the role of ideology by conceptualizing political institutions and not emphasizing internal institutional conflicts. As such, the Marxist critique creates a universalist concept of elite. This allows for a fuzzy definition of governing elite and its role in the bureaucratic structure of society (Parsons 1957) and prevents the challenge to identify competing elite groups in the political decision-making process.

The development of a fuzzy definition of the Bureaucratic Elite has theoretical and empirical implications in defining power (Dahl 1958). The ambiguity between political influence and power does not allow for a clear-cut definition of power (Dahl 1961) and ignores the process of the monopolization of resources and the mobilization of political decisions by the elite. The outcome is a vague understanding of how the Bureaucratic Elite operates in the bureaucracy.

In an effort to develop a more clear-cut definition of the Bureaucratic Elite, G. William Domhoff expanded on the definition of power units by combining the Marxist theory with insights of the protestant establishment. To demonstrate authority, Domhoff challenged the pluralist theory by emphasizing the role of elites in associations by illustrating the importance of harmonization, social reproduction, and a consensus on social values for ruling elites (Domhoff 2006).

Hence, the Bureaucratic Elite is defined by groups that have long-term social interactions and interconnections that overlap and create networks that allow for the shaping of public policy decisions. This, in turn, has confirmed the tendency for the bureaucracy to form an oligarchy. These findings have led to the development of the Mills-Domhoff approach on power structures (Domhoff 2006). The approach further analyzes elite networks in social and political institutions by focusing on the interactions between individuals and bureaucrats at different levels of government.

## Bureaucratic Elite Within the State

The role of the state is fundamental in understanding the creation of the Bureaucratic Elite. Furthermore, the bureaucracy in the state is responsible for the transformation of power throughout different levels of government. As a result, the recognition and role of the Bureaucratic Elite in the state-building process is at the foundation of the Weberian approach. In drawing a connection between the state and the Bureaucratic Elite, Weber describes its role in the state as the centralization of political power and the monopoly of coercion which creates professionalism in the bureaucracy and bureaucratization to create autonomy. Hence, the consolidation of power allows elites the ability to counter the decision-making process through bureaucratic structures. As the Bureaucratic Elite develops autonomous political power in the decision-making process, the state provides bureaucrats with the ability to extend their power beyond the policy structure of the state. This, in turn, enables bureaucrats to shape public policy and create strong connections to business, state, and military elites.

These connections create a political culture among actors which is similar to that of business, state, and military elites. As a result, the bureaucratic structure provides a social background for technocrats and business leaders to develop specific public policy preferences for the creation of homogeneous and cohesive elite groups. The homogeneity resulting from these cohesive groups allows the bureaucracy to defend public policy programs and legitimize the power within the state. As bureaucratic elites form cohesive groups throughout levels of government, a link between the state and civil society is created. The backlash from society on state control forces the Bureaucratic Elite to formulate specific departments to meet policy demands from civil society, thereby allowing the Bureaucratic Elite to shape state action and political preferences in the reaction to interest groups and nonstate actors (Skocpol and Ikenberry 1983).

In the state, governmental departments form a bureaucratic structure that divides elites by upper and lower strata (Horowitz 1983) which allows the Bureaucratic Elite to integrate political power and consolidate territory and to transform the relationship between the bureaucratic structure and the territory. Furthermore, the transformation creates a definable link between the ability of the Bureaucratic Elite to implement power over society and political influence to consolidate and redistribute resources. Consequently, the Bureaucratic Elite maintains legitimacy in its relationship with society.

## Conclusion

The Bureaucratic Elite has been criticized for enabling inefficiencies, formalisms, and redundancies in the administrative system due to its shortcomings in providing sufficient administrative services. For this reason, the business elite model utilizes the same organizational instruments that the Bureaucratic Elite implements.

The failure of the bureaucratic elite to implement policy is a result of its unrestricted self-fulfillment. Since technological advancements in the bureaucracy, the elites have been the main actors to comply with the mission of governmental agencies. As a result, the Bureaucratic Elite will maintain its role in the bureaucracy until there is another method to pursue compliance with society. Scholars of the Bureaucratic Elite recognize the important role of officials in advising on policy and technical organizational methods. As the world evolves and is faced with new societal challenges, the Bureaucratic Elite

will meet the demands by adapting to the administrative system and expanding it.

# Bureaucratic Growth

Steven G. Koven
Department of Urban and Public Affairs, University of Louisville, Louisville, KY, USA

B

## Synonyms

Administrative state; Budget maximizing model; Bureaucratic inefficiency; Fourth branch of government

## Definition

Expansion in the size and scope of public sector responsibilities. Ever enlarging duties of agencies in an executive branch of federal, state, or local government.

## Introduction

For a nation founded on the principle of opposition to tyranny, the growth of the bureaucracy is ironic, and for many citizens it is alarming. Cultural predispositions that prioritize individual freedom, self-reliance, property, privacy, and free enterprise justify limited government. At the same time as citizens defend limited government, countervailing pressures prod government to expand their ever-growing list of public sector responsibilities. These public sector responsibilities include but are not limited to promoting justice, protecting the nation from invasion, ensuring domestic tranquility, stabilizing the economy, limiting environmental pollution, providing a safety net for the poor, and encouraging economic growth.

The tension between advocates for a more limited or more expansive state is ongoing. These pressures date back at least to the times of Alexander Hamilton (who desired a strong national government) and Thomas Jefferson who was in favor of greater decentralization. At various times, advocates of centralization and decentralization

have gained ascendency. For example, the electoral victory of Franklin Roosevelt over Herbert Hoover in 1932 ushered in a period of government growth. The election of Ronald Reagan in 1980 marked at least a rhetorical reversion to a time of less state regulation, more individual freedom, lower taxes, and less government intervention into the affairs of private citizens. In the era of Donald Trump and Tea Party populism, fears of a "deep state" have gained traction. This fear of the "deep state" is consistent not only with public sector growth but also with the discretionary power of career bureaucrat whose power is obscure to the average citizen. Many citizens view bureaucratic power as an unaccountable threat since career officials are not subject to the electoral will of the people.

The bureaucracy in the United States has grown over time in response to both domestic and foreign policy concerns. The Great Depression of the 1930s and urban riots of the 1960s fostered the creation of a host of domestic programs to provide jobs and alleviate poverty. World War II and the ensuring Cold War perpetuated an expansive military industrial complex. The US government's intelligence community grew extensively after the September 11, 2001, attacks on New York City's World Trade Center. Both Democratic and Republican administrations witnessed large increases in public spending. Republican administrations were more likely to expand the foreign policy/military side of the bureaucracy, while Democratic administrations were more likely to increase spending for domestic priorities.

A substantial government sector is a reality that will not reverse course. The US bureaucracy will not return to its size at the nation's founding. It is therefore necessary to address directly the implications of a large bureaucracy. In order to understand government expansion in the United States, this brief entry reviews major theories of bureaucratic growth and describes the evolution of public sector growth. A concluding section offers an assessment of the implications of sizable public sector bureaucracies.

## Theories of Bureaucratic Growth

Two major perspectives help to explain public sector growth and its corollary of expanding personnel to administer programs. The "citizen-over-state" theories of government represent the first perspective. These theories begin with the premise that citizens demand government programs and governments respond to the will of the people. In contrast, the second perspective of "state-over-citizen" theories posits that the size of government is independent from citizen demand. Under this conceptual framework, government grows mainly because of desires of bureaucrats to increase their budgets, personal power, and prestige. These personal desires produce aggregate spending that is in excess of efficient levels (Garrett and Rhine 2006).

Citizen-over-state theories focus on three factors that drive public sector spending. First, government spending and personnel grow because of lower productivity in the public sector as well as higher wages of public employees. The near monopoly nature of many publicly provided goods and services encourages the creation of unions and the demand for higher wages. The second factor in citizen-over-state theories of government expansion assumes that government serves as a redistributor of income and wealth. Growth in government occurs in part because over time new, lower income entrants into the voting population elect leaders that increase redistribution. Candidates promise more and more transfer payments to groups of citizens in order to gain their support. In addition, if the middle class begins to feel economically pressured and embrace a closer affinity to the poor, they will demand greater redistribution. A final factor relates to interest group pressure. Through concentrated lobbying, an interest group can obtain a desired policy. Elected officials are more responsive to the direct pressure of specific interest groups than they are to the general taxpayer. Empirical evidence supports a positive relationship between the numbers of political action committees (surrogate for interest groups) and federal

government spending. Elected leaders fear the possible retribution of strong interest groups more than they fear the electoral wrath of less interested taxpayers.

Inherent in these citizen-over-state theories of government expansion is the idea that government is demand driven and grows because of citizen demand for public services. In contrast, state-over-citizen theories posit that the size of government is independent from citizen demand. Government grows because of inherent inefficiencies in public sector activities and self-interested incentives of bureaucrats.

Prominent among the state-over-citizen theories are (1) bureaucracy theory, (2) fiscal illusion, and (3) monopoly government. Bureaucracy theory relies heavily on the seminal work of economist William Niskanen (1971) and his budget-maximizing model. Niskanen's model represents a stream of public choice theory first presented in 1968. According to Niskanen, rational bureaucrats seek to increase their budgets in order to increase their personal power. Niskanen asserts personal preferences for self-aggrandizing outcomes (such as a higher salary, added prestige, or additional power) that leads to an expansion in the size of government. Because of personal priorities of bureaucrats, the size of the bureaucrat's budget will be greater than the amount required to meet the demands of citizens. Niskanen proposes that government bureaucrats are able to increase spending because of their monopoly positions. Unlike the private sector with its focus on profit and loss, the public sector does not possess an easy to operationalize measure for success. Due to the opaqueness of their delivery and loss of long-term accountability, excessive production of services may produce a "dead weight" loss in the public sector. Bureaucracy theory does not deny the citizen demand models of government, but it suggests that bureaucrats can generate budgets that are in excess of what citizen demand warrants.

The fiscal illusion theory proposes that the voters are not aware of the true size of the public sector bureaucracy because they assume that the size of government is consistent with the quantity of taxes they pay. In order to create a fiscal illusion, governments increasingly use taxes that are less intrusive on average citizens. Federal withholding or income taxes and withholding of local property taxes through monthly mortgage payments reduce the perceived intrusiveness and perceived burden of taxes. When governments automatically withhold taxes from earnings, taxes are less likely to stimulate resistance.

The monopoly government theory proposes that government not only provides basic goods and services (such as police and fire protection) but also "bundles" narrowly defined issues with the popular basic services. The "bundling" of goods and services helps legislators achieve outcomes such as an increased probability of reelection, monetary gain, and psychic rewards through pursuit of personal ideals. Monopoly government theory borrows from the private sector where a monopolist can increase profit by bundling products into a single package. Consumers purchase an entire package of products and must accept the less desired goods along with the more desired goods. Prominent economists extended the monopolist view of government in a "leviathan" government model (Brennan and Buchanan 1980). In the "leviathan" government model, the sole objective of government is to maximize revenue. Citizens lose all control, and the model views political competition as an ineffective constraint on government growth. The leviathan view is the mirror opposite of citizen-over-state theories. In the leviathan model, only constitutional constraints on the government's authority to tax and issue debt can limit bureaucratic growth.

Other explanations of bureaucratic growth exist. For example, Wagner's law posits that government grows in accord with changes in society, particular to changes in urbanization and industrialization. Wagner's law explains that a feature of the transition from an agricultural to an industrial economy is an increase in demand for services such as law enforcement, fire protection, transportation, education, and sanitation services. Urbanization with its potential for conflict creates a need

for government to take on more responsibility in supplying services.

## Evolution of Growth of Government in the United States

The founders of the United States did not intend to create a large public sector. The first agencies of the federal government were the Departments of War, State, Navy, Treasury, and Office of the Attorney General. At the end of the Federalist period (1800), about 3000 appointed civilian officials worked in the federal government. The original State Department consisted of nine employees in addition to the Secretary of State. The War Department did not reach 80 civilian employees until 1801. Over time, the number of agencies and personnel steadily increased. Expanded responsibilities produced the Department of the Interior in 1849, the Department of Justice in 1870, and the Post Office Department in 1872. By 1881, the number of federal personnel grew to about 95,000; by 1925 federal workers increased to nearly half a million (Wilson 1975, p. 77).

Clientele pressure represents one factor that contributed to the increase in the size and scope of the public sector. Administrative agencies such as the Department of Agriculture and the Department of Commerce and Labor formed in response to demands of farmers and workers. In 1862, Congress created the US Department of Agriculture (USDA) with the goal of developing and disseminating new farming techniques. In 1888, labor organizations such as the Knights of Labor helped secure the creation of a Department of Labor. In 1903, the Department of Labor was renamed the Department of Commerce and Labor. During the nineteenth century, client-oriented pressures also led to the creation of bureaucracies at the state level.

A desire for regulation of massive corporations represents another factor that contributed to public sector growth. The inability of states to regulate powerful private entities such as the railroads facilitated the creation of the Interstate Commerce Commission (ICC) in 1887. Political pressures led to establishing regulatory bodies such as the Federal Reserve Board in 1913, the Federal Trade Commission in 1914, and the Federal Power Commission in 1920. Some analysts view these regulatory agencies as a fourth or hidden branch of government because they play an unpublicized role in shaping policy.

The Great Depression and President Franklin D. Roosevelt's New Deal stimulated large-scale bureaucratic expansion with programs such as the Civilian Conservation Corps (CCC) and the Work Projects Administration (WPA). These programs helped to ease the pain produced by the collapse of the private sector economy. The Great Depression also changed attitudes about the role of government. Attitudes about poverty shifted away from a focus on individual failures toward greater acceptance of structural faults in the capitalist system. Government employment became a realistic option, and Keynesian economic policies became accepted. Unemployment essentially disappeared after 1941 as World War II engulfed the nation.

National security remained a concern even after World War II. The National Security Act of 1947 established the Central Intelligence Agency (CIA) to collect, coordinate, and disseminate foreign intelligence. In 1946, Congress created the Atomic Energy Commission (AEC) to foster and control the peacetime development of atomic science and technology. Congress set up the National Science Foundation (NSF) in 1950 to promote basic and applied research and the National Aeronautics and Space Administration (NASA) in 1958 in response to the USSR's launching of the Sputnik satellite in 1957 (p. 51).

The next great wave of government activism occurred during the 1960s. Lyndon Johnson's Great Society introduced programs such as food stamps, worker training, Medicare, and Medicaid. In addition, the government enacted many regulations to protect the environment, worker safety, and consumers. Agencies such as the Department of Housing and Urban Development, Department

of Transportation, and Appalachian Regional Commission formed during the Johnson administration.

More recently, the Homeland Security Act of 2002 established the Department of Homeland Security (DHS). This Cabinet level organization consolidated 22 agencies related to homeland security. Organizations such as US Customs, Immigration and Naturalization Services, Immigration and Customs Enforcement (ICE), Transportation and Security Administration (TSA), Federal Emergency Management Agency (FEMA), US Coast Guard, and the US Secret Service were consolidated into the new Department of Homeland Security. According to DHS data, in fiscal year 2017, DHS received a net discretionary budget of $40.6 billion and comprised more than 240,000 employees.

Personnel data, however, grossly underestimates the true size and scope of the federal government. The US public sector has "stealthily" expanded using the proxies of state and local government, for-profit businesses, and nonprofit organizations. Between 1960 and 2017, the number of state and local government employees expanded significantly with the aid of federal money. Government organizations such as the Department of Defense conceal their true size by hiring outside contractors. The government obscures numerous national security-related expenditures. The US government does not openly reveal "black budget" programs that cover expenses related to military research and covert operations. Examples of black budget expenditures include spending for aircraft such as the F-117 stealth attack aircraft and the B-2 stealth bomber. For a long time, the government denied the existence of these aircraft. The public sector also accounts for a large proportion of the revenues to nonprofit organizations.

## Conclusions

Bureaucracies in the United States and in other nations grew significantly in the twentieth and twenty-first centuries. Some authors claim that the growth is a function of modernity. Modern societies simply require the efficiency and neutrality inherent to bureaucracies. Other factors that have contributed to the growth of government include clientele demands, the need for regulation, and changing attitudes toward government, war, and depression. "Demand"-oriented explanations focus attention on citizen needs and pressures they exert on their representatives. In contrast, "supply"-oriented explanations accept the view that bureaucrats have an interest in expanding the size and scope of government in order to maximize their power and prestige. Explanations differ; however, the data is clear in that the reach of government has grown exponentially. This growth is a source of anxiety to civil libertarians who fear the power of a centralized state. In addition, some view an expansive state as a threat to work incentives and the high standard of living that has accompanied the laissez-faire economic system of the United States.

## Synonyms

Administrative failure; Bureaucratic organization; Disaster governance

## Definition

*Disaster management inertia* refers to the inability of government agencies and institutions to prevent and mitigate the impacts of disasters because of bureaucratic challenges. *Bureaucratic discretion* is granted among public managers to install effective mechanisms in resolving challenges in policy implementation. Ineffective disaster management measures suggest the inevitability of inertia in the *bureaucracy.*

## Introduction

*Disaster management* is a governance problem where disaster leadership is a precarious but most coveted responsibility. Commonly, disaster governance is viewed to be effective if it has a centralized decision-making and decentralized operations (Kapucu 2005). Given that such a structure is accurate, crucial among public managers are their respective partnerships across government and nongovernment agencies to facilitate the decentralization of disaster response operations, while decision-making is centralized at the top management.

Meanwhile, disaster leadership involves (a) defining and operationalizing each member's responsibility to avoid confusion and overlapping of functions and responsibilities in the actual operations, (b) motivating leaders of partner agencies to actively participate in the planning process to harmonize the targets and activities during disasters, and (c) adapting and making last minute changes in order to address immediate concerns while ensuring that the targets are attained regardless of political conditions. In doing so, disaster and contingency plans are strengthened, competence among managers is enhanced, and political intentions are made clear to prevent administrative bickering which seriously hampers disaster operations.

Disaster management is undeniably one of the most complicated facets of governance. National issues such as disasters require tumultuous effort among government agencies and stakeholders to effectively combine resources and successfully address the needs of the affected communities. Collaborative undertakings emphasizing the importance of collaboration across organizational and sectoral boundaries in carrying out public purposes are widely recognized. The impacts of disasters which trigger coordination and cooperation among agencies led to intergovernmental and interorganizational relations which are complex interactions among the multiple levels of government. Coordinated efforts between government and nongovernment organizations during the disaster or crisis management demand several capacities among responders and public managers since organizing initiatives are as complicated as the impacts of disasters they tend to address.

In general, working toward an effective interorganizational cooperation during emergency management entails several indicators uniting the entire bureaucratic organization. Moreover, specific challenges attached to both process and structure of disaster governance include lack of incentives and lack of capacities, and political dynamics impedes performance. The dynamic relationship among agencies suggests the significant role of public managers in addressing challenges during a crisis such as the need for a timely response and to determine the limitations of command and control. Nonetheless, certain levels of discretion are given to local institutions and agencies as recognition of their vital role in handling crisis situations (Congleton 1982). However, post-disaster conditions reveal the

consequences of *bureaucratic inertia* such as lack of coordination and unreliable information.

## Disaster Management: A Complex Reality at a Glance

Disaster management operation is often plagued with the need for information sharing and coordination. The lack of coordination leading to a number of possible failures such as inappropriate allocations of first responder resources and a delayed evacuation that leads to the higher number of casualties puts greater emphasis on the necessity of coordination in disaster management. Diverse obstacles hinder coordination in the different levels of implementation, and the existing institutional measures encouraging individuals and agencies to share information are unable to sustain effective communication. Initially, agencies participate and engage in information exchange, but over time, agencies are becoming more concerned about receiving information than providing for another agency. This predicament implies a less cohesive nature of the organization where trust and social capital is weak.

The role of trust is as equally important as leadership in managing disasters. Kapucu (2005) noted that effective response and recovery operations require collaborations and trust between government agencies at all levels of implementation and between public and nonprofit sectors. Trust is built with constant and active exchanges of information which boosts the dependability and competence among partner agencies. Trust building requires a gradual process of constant interaction where such process is facilitated by a structure designed to nurture effective communication. One starting point of trust building is the availability of programs and mechanisms, such as incentives, that build and promote effective communication. In practice, there are cases where effective communication is obstructed by the unwillingness of government agencies. Such unwillingness is anchored either on the lack of competence or on the reluctance to learn new things. Thus, the presence of incentive mechanisms and a new structure facilitating the exchanges of information motivate agencies to participate voluntarily. Building interdependencies among agencies and organizations through interactive processes such as face-to-face dialogues increases trust, builds social capital, and develops into a collaborative culture which substantially increases the speed of decision-making which leads to successful disaster management operations.

Consequently, the performance of an organization lies heavily on the characteristics of leadership and quality of information passed on in the network and how such information is processed and translated into actions. Recent post-disaster findings suggest the need for institutional innovations in order to address concerns on adaptability and varying institutional norms in every level of bureaucratic organization.

## Inertia in Bureaucratic Organizations: Some Insights

Bureaucracy, which root word is "bureau" referred to the cloth used to cover the desks of French government officials in the eighteenth century and became linked with a suffix signifying rule by the government (Lutzker 1982). Over time, the term bureaucracy has evolved and signified the proliferation of agencies staffed by biased and autocratic officials whose work is characterized by countless twisted processes.

Max Weber theorized that there are three groups of bureaucratic characteristics. The first group is related to the structure and function of an organization which is composed of a hierarchy of offices with fixed areas of jurisdiction anchored on specific administrative regulations. The second group of characteristics is about incentives or rewards determined by rank or position in the organization. Lastly, the third group is about the protections accorded the officeholder that as a civil servant, he has sufficient and relevant training, has passed the prescribed examinations for appointment in administrative office, and has the necessary ability to be a civil servant, and therefore, he cannot be easily removed from office as long as he satisfactorily discharges

his duties. In sum, Weber's ideal bureaucracy revolved around the structure, incentive mechanisms, and application of rules and precedents in decision-making where administration engages in defining and redefining institutional goals, resolving a conflict over the exercise of authority, and dealing with the consequences of policy variations.

This conception of Weber holds true after several decades of bureaucratic evolution and innovation. Standards related to performance and accountability are becoming sophisticated in steering bureaucrats and civil servants toward effective governance and excellent public service. Seemingly, bureaucracies today are becoming more complex and multifaceted, and with the advent of innovation, any changes entail additional responsibility with no additional incentive attached to it. Consequently, resistance to administrative changes is unsurprising.

Bureaucratic inertia, in this essay, is used interchangeably with administrative inertia and government inertia which refers to the "sense of avoiding making decisions that produce more socially efficient outcomes" (Ritchie 2014). Inertia is said to be a result of a perfect blend of risk avoidance among government employees, formalization as well as the presence of an incentive structure which underscores decision restraint.

Ironically, the formalized decision-making processes in a bureaucratic organization are set to aid innovation; however, instead of facilitating possible changes, such processes are considered overly bureaucratic which in turn obstruct innovation. With this, government agencies become less likely to innovate due to the complexities of practical realities which in the long run has formed a culture of risk aversion. On the other hand, bureaucratic inertia is also viewed as a result of how civil servants optimize their options using their respective discretions in the face of certain constraints.

Moreover, bureaucratic inertia is highly dependent on the bureaucratic preferences in terms of how such policy, innovation, or changes affect the interests of the bureaucrats. A policy that is aligned to the interests of the bureaucrats is easily adapted with lesser changes or distortion in the implementation processes. However, a policy not aligned to the preferences of the bureaucrats is hardly executed. Thus, the bigger the organization, the more apparent bureaucratic inertia because the transmission of policy down the organization hierarchy presents each civil service with the opportunity to make use his discretion. These characteristics of bureaucratic inertia are highly noticeable in disaster management operations.

## Disaster Management Dilemma

Social concerns are commonly addressed by a policy, and every policy implementation is geared toward maximizing the available resources while promoting the public welfare. Policy implementation is where the goals and objectives formed into a law or policy are enforced into concrete actions by the responsible institutions and organizations that are often, but not always, part of the public sector. To ensure effective implementation, program details are laid out, budgetary requirements are met, and decision-makers or responsible agencies are identified. To facilitate the implementation of policy, bureaucratic discretion is granted among public managers. The existence of bureaucratic discretion is sufficient to allow distortion of policy and resistance to changes in official policy. Hence, policy implementation is critical as political and administrative actions are at the frontline, and such actions reflect the intentions of public managers which barely follow the objectives and programs of the policy. As a result, execution of policies is oftentimes distorted and delayed.

Similarly, with the discretion granted to implementing agencies, disaster management is hardly immune to bureaucratic bias and inertia. The allocation of resources and oversight functions of the policymaking body in policy implementation is crucial (see Fig. 1). For example, basic among democratic societies is the legislature's approval of the budget for implementing agencies prior to the utilization of government funds. Otherwise, the proposed activities are either revised or rejected. With this, lobbying

**Bureaucratic Inertia, Fig. 1** The flow of influence in disaster management. (Source: Adapted from the model of Bendor and Moe 1985)

and partisan politics underscore policymaking. The legislature's capacity to influence budget decisions is a function of both its authority over executive budget recommendations and its internal processes for decision-making. Hence, policymakers have a significant effect on policy implementation and to influence policymakers suggest prudent steps in maximizing the advantages of bureaucratic discretion. Meanwhile, the bounds of bureaucratic discretion normally fall between completely constrained behavior and that of complete freedom to allocate the budget as the bureaucrats see fit. With the given discretion, it is to be expected that every bureaucrat in every level of the administrative authorities will use it to advance his own self-interests (Congleton 1982). Consequently, the absence of an apparent convergence between the interests of implementing agencies as bureaucrats and policymakers is vexing.

On the other hand, disaster-implementing agencies, as bureaucrats themselves, face both budget and policy constraints. The lack of resources to effectively respond to the impacts of disasters implies the failure to create enabling policies and mechanisms to access funds from other sources. The inability of agencies or organizations to manage its own problems leads to inertia together with other various reasons. First, the leadership of the organization is weak and lacks the tenacity to realize the goals of the organization either due to exhausting political pressures or unwillingness to learn effective control and management of the internal and external organizational challenges. Second, the organization is composed of unmotivated and inept staff who no longer share the similar vision with the organization. Third, organizational culture disrupts professionalism and nurtures mediocrity. Social norms, beliefs, and values and underlying assumptions influence decision-making and serve as a basis in determining the culture of the organization, which is reflected in the process, structure, and performance of a particular group or organization. Lastly, the lack of accountability mechanisms fosters gradual innovation in bureaucratic organizations. Accountability among bureaucrats is an intricate issue as it encompasses norms, policies, discretion, and self-interests. The complexity in measuring and ensuring accountability drives social institutions to arrive at formal agreements in most undertakings. Nevertheless, any bureaucratic organization faced with either one or all of these challenges surely takes small steps in providing ultimate alternatives to the challenges it's facing.

On a normal social condition, gradual changes in the bureaucratic organization are relatively tolerable. However, in times of emergencies, processes including decision-making and actual disaster operations demand to be organized and synchronized to save lives and properties. In doing so, public officials ought to demonstrate efficiency and the importance of their involvement in ensuring that the entire operations run smooth and successful, but more importantly, they should be properly accountable to the power they exercise. The result of disaster management is determined real time and so are the agencies accountable for the delivery of such tasks.

However, due to organizational culture and the lack of stringent accountable mechanisms, liable agencies and bureaucrats go unnoticed. Significantly, accountable bureaucrats are not deemed answerable to the community who suffered severe losses in terms of lives and property. In fact, the same bureaucrats get often reelected. The startling amount of political support the bureaucrats are getting from the public suggests important implications: public trust could be generally high as opposed to the common knowledge of decreasing confidence in government agencies; electoral institutions are already passé and therefore needs to be updated, or performance either in policymaking or policy implementation is not a sufficient indicator in choosing credible leaders. Consequently, bureaucrats fall short of what is expected from them and the public mistrust to the government is deteriorating over time.

The declining public trust is commonly perceived as instigated by the incapacity of the bureaucrats to address social concerns. Thus, bureaucratic innovations are focused on expanding the bureaucracy, losing sight on the actual cause of the problem. Moreover, enhancing the electoral institutions of the country alleviates the impacts of bureaucratic problems and improves governance in general (Meier 1997). However, most of the governance problems emanate from bureaucratic structures where organizational processes and procedures are anchored. Such bureaucratic structures are either the output of the actors' motives and strategic preferences in policymaking and implementation or a product of past decision. With this, disaster governance is facing a constellation of challenges as products of both culture and innovation suggesting the inevitability of inertia.

On the other hand, as detrimental as it seems, inertia brings advantage to bureaucratic organizations, too. For example, the continuous desire of the implementing agencies to increase its budget magnifies the relevance of the oversight functions of the legislative bodies. The agencies incapability of attaining its targets regardless of political and social concerns directly reflects its performance which serves as a basis for legislative bodies to either approve or reduce the proposed budget. The undesirability of a budget being slashed motivates the implementing agencies to achieve their targets and use their discretion to effectively employ ways to minimize or avoid the possible challenges that hamper the implementation. In doing so, innovation in governance happens and bureaucracy evolves.

## Conclusion

Disaster management inertia is a preordained feature of disaster governance which can be moderated (a) when bureaucrats utilize essentially the full limits of their discretion by at least improving organizational incentives so that bureaucratic goals and disaster management goals are more compatible and (b) when lead agencies are replaced with agencies in tune with those of the policymakers. The complexity of preventing administrative inertia goes at par with the difficulty of addressing the challenges toward effective disaster governance. Understanding the lineages of each social and political concern (norms, culture, experiences) may lead to some better but intricate resolutions. However, it is in the complexity of these fundamental governance problems that feasible solutions should be taken. Until then, bureaucratic inertia lingers to be an enduring predicament in disaster governance.

## Introduction

How do bureaucrats influence in the policy formulation process? Do they influence the most political stages of this process, or is their influence restricted to policy implementation? The relationship between bureaucracy and policy formulation has been studied mainly from political science and public administration. However, existing studies rather address the role of bureaucracies in public policy implementation, principally from an organizational approach, describing topics related to efficiency and effectiveness of the bureaucracy. In the same way, a line of researches analyze how street level bureaucrats change, in the implementation stage, the objectives defined by politicians (Lipsky 1980).

However, there are few researches that analyze how bureaucrats influence the most political phases of the policy process, as agenda setting, policy formulation, and decision-making, and what are the mechanisms through which they influence. This can be explained because there is an implicit concept that bureaucracy is separated of political process, and their work would be exclusively related to policy implementation. In addition, few investigations analyze the role of bureaucrats in relation to the place they occupy in the administrative hierarchy. In relation to the above, the degree and type of influence of the bureaucrats on the most political stages of the policy making process will depend on the place in the bureaucratic hierarchy in which they are.

## Politics and Bureaucracy

In the literature that address the relation between politics and bureaucracy, it is possible to observe two large branches: one of them analyzes as a starting point the distinction between the roles played by the bureaucrats and the politicians, under the idea of *politics-administration dichotomy*, outlined by Wilson (1887). Behind this idea, a particular image of a public servant emerged, a public servant who is politically neutral and with a high technical expertise, who acts oriented by the objectives determined by the political authorities. On the other hand, the *bureaucratic politics approach* (Waldo 1952; Peters 1995), outlined that bureaucracy, as a rational actor, looks to its own interest, and for this reason, it exerts a strong influence on the political actors, being part of the policy-making process, even in their most political stages. This can be explained by the nature itself of the political process, characterized by the presence of different kinds of actors, with various interests, so it is impossible only for politicians to define all aspects of a public policy. In this sense, the politician, because of the essence of his/her activity, cannot recognize all specific aspects involved in the policy-making process, a reason why he/she gives high spaces of discretion (explicitly or implicitly) for bureaucrats to act, defining the scope of such policies.

This bureaucratic influence can be explained because in their nature, bureaucracies are political creations, making it impossible for them to show complete neutrality. As Aberbach and Rockman (1994: 462) point out, in the bureaucracy "(. . .) Politics inevitably enters the picture." In view of the above, different

This article is a product of an extensive research program which has included FONDECYT project 1120546

institutional structures and devices have been designed in order to control the actions of bureaucrats, aligning them with the objectives set by democratically elected politicians. For instance, different kinds of "contracts" have been established between public servants and politicians in different contemporary democracies. Even though these and other tools seek to limit the bureaucratic discretion to the will of politicians, there are still many spaces where bureaucrats can have influence on policy-making.

## Bureaucracy and Policy-Making

In relation with the notion of the political-bureaucracy dichotomy, the approach that observes public policy as a process initially accepted this idea of a separation of the areas of action between bureaucrats and politicians. This approach describes the policy-making process as a series of stages since a determined problem is selected by the politicians, until the moment in which the response (or public policy) is implemented and evaluated. The first stage, called *Agenda Setting*, explains why certain problems are recognized by politicians and emerge on the government agenda, while others are left out. *Policy Formulation* is the phase that is related to the choice of policy options around the recognized problem, which must be politically acceptable and technically and administratively viable. Next, at the *Decision-Making* phase, the political authority selects the policy alternative, and later, at the *Implementation* stage, the decisions of politicians are translated into concrete actions. Finally, at the *Policy Evaluation* stage, it is determined whether the policy reached the objectives initially proposed (Howlett et al. 2009).

Initially, this approach posited that the establishment of the agenda, policy formulation, and decision-making process are largely in the hands of politicians, while policy implementation and evaluation are the field of action of bureaucrats (Kingdon 1985; Lindblom 1991). In this way, the bureaucrats would be in charge of implementing the decision of the political actors with criteria of efficiency, economy, and effectiveness. However, an important group of research studies have shown that bureaucrats, and especially those bureaucrats at the mid to high level of the hierarchical structure, would influence not only the implementation of the policies, but also in the political stages, such as agenda setting, policy formulation, and decision making (Wu et al. 2010).

Consequently, within this same process, bureaucrats would have an important role in agenda setting, on account of the fact that for their professional career status, they could exert influence by constantly showing evidence and technical information, allowing a public problem to remain visible to politicians throughout time. Because of their location in the bureaucratic structure, bureaucrats have considerable advantage to obtain specialized information, which is usually used to characterize a public problem. In this way, they can select the information they give to politicians or to specific groups of civil society interested in a certain subject, with the aim of influencing the characterization of the problem. Finally, in the case of political conjunctures or "policy window," which act as a catalyst for a certain policy to be included in the decision-making agenda, bureaucrats have at hand possible specific solutions to the particular problem. As a result of these conjunctures, politicians need to show solutions in an expeditious way, selecting proposals previously elaborated by public managers, like policy initiatives.

With regard to policy formulation, it is the government agencies and bureaucrats within them, who construct different public policy options, due to their technical expertise in particular areas of intervention and their careers in similar positions. In addition, bureaucrats have developed the knowledge of the political networks and interests of the various actors involved, which would eventually determine the political viability of the different alternatives. In this sense, there is evidence that a large part of public policy decisions respond to incremental decision models, that is, the proposals are modifications or improvements to programs that are previously operating, with whose implementation public

managers are already acquainted, so they can have a considerable influence on politicians because of their knowledge.

In relation with decision-making, bureaucrats can influence through expert advice regarding the different policy options from which politicians can choose. In this sense, through technical knowledge, they can project future scenarios of each policy option analyzed, considering current factors, trends, and projections, effects of the policy on similar areas that they can influence, and the effects that the new policy could have on different dimensions.

Policy implementation is also a political stage, since different government agencies compete for greater public resources or greater prominence; organized civil society groups also seek to influence definitions and mechanisms to implement the policy selected by bureaucrats, and politicians are equally interested in what happens in the implementation, because a good acceptance by the citizens can bring better results in future electoral processes. In addition, government agencies must define the scope of laws, through the elaboration of secondary legislation such as regulations or decrees, which are drafted by public managers. Finally, in the evaluation stage, although it could be characterized as a purely technical activity, bureaucrats also have wide discretion, from the information collected for the evaluation to the selection of the instrument used to evaluate. In this way, the results of an evaluation can have important political repercussions, and they can also serve as input for the public policy evaluated to be modified.

## The Bureaucrat as Policy Maker: The Policy Bureaucrats

In this way, it is possible to visualize a special type of bureaucrat, who actively influences the development of public policy: policy bureaucrats or policy managers (Page and Jenkins 2005; Howlett and Walker 2012; Adams et al. 2015). From an organizational approach, policy bureaucracies are "part of government organizations with specific responsibility to maintain and develop policy, (which are) mobilized before the most significant policy initiatives are launched" (Page and Jenkins 2005: v). For Howlett and Walker, policy managers are a specialized group of middle-level bureaucrats, who are characterized by their active involvement in the policy making process and also in the evaluation stage of this process. They "are not the only policy advisors to the government, of course, but are part of a group of 'privileged insiders' serving within policy advisory systems to the government" (Howlett and Walker 2012: 212).

Literature often places policy bureaucrats in middle and high positions in the hierarchical structure. In this line, Morgan et al. (1996: 360) point out that middle-level bureaucrats are characterized by their work in developing public policy responses for daily affairs. For Diefenbach (2011: 3), intermediate managers play a key role in entrepreneurship in the public sector, thanks to their location in the organization that allows them to mediate between different groups, being able to communicate new proposals to the authorities. Moreover, research shows that managers at the middle and higher levels of the public sector are identified as the most entrepreneurial, the most important group at the time of innovation (Borins 2000), and the most important source of creativity in the sector (Bernier and Hafsi 2007).

Howlett and Walker (2012) distinguish between these policy managers from: "*coordinator-planners*" associated with activities such as coordination, evaluation, planning, or liaison; "*research-analysts*," whose roles are those of policy analysts, project managers, and researchers and the "*manager-director*" associated with the role of a manager and a leader. Specifically, they showed that manager-directors are more involved in determining the scope of policy options, by negotiating with different actors around politics. On the other hand, research-analysts invest their time in the analysis of the main functions of politics, collecting data and carrying out research that is useful in setting the agenda and making decisions. Finally, coordinators-planners play an active role in all stages of policy making.

Hoppe and Jeliazkova (2006) similarly try to categorize the policy bureaucrats, highlighting

their positive attitude towards political activity and skepticism regarding the notions of objectivity and neutrality in policymaking. Like Howlett and Walker (2012); Hoppe and Jeliazkova (2006) try to establish a typology of policy bureaucrats. They characterize them as: *Process director*, who has an active role in advising politicians on the scope of the policy. Their main functions would be to manage and monitor processes; *Public Policy Philosophers*, who see themselves a little more distant from politics, in order to take a more critical position if necessary; *Policy Advocate*, who is characterized by a strong defense or as promoter of the position of the politician. This type of bureaucrat has a self-image as a subordinate to the politician; *Neo-Weberian*, who is closer to the idea of technical objectivity, establishing an important division line between what is technical and what is political, although with certain shades since they understand the context of uncertainty in which they are operate; and *Expert Advisor*, who see themselves as advisors who base their influence on their analytical skills and their objective vision. Hoppe and Jeliazkova (2006: 42) finally point out that, as a main characteristic, policy bureaucrats have the ability to recognize public policy problems, as well as to develop knowledge of the political process and of the skills to operate in these specific contexts and institutions.

## Mechanisms of Influence of Policy Bureaucrats in the Policy-Making Process

In the specialized literature, it is possible to find two main mechanisms through which the policy bureaucrats influence the policy-making process: the discretionary spaces given explicitly or tacitly by the politician and through a special kind of expertise that policy bureaucrats develop, called policy expertise.

### Discretion as an Influence Factor of Policy Bureaucrats

Page and Jenkins (2005) assess the degree of discretion of policy bureaucrats pointing out that the decisions made by politicians, in relation with public policies, are generally vague and inaccurate, and that is the reason why many times the role of bureaucrats is to define specifically the scope of the policy. This would be explained by the nature of the political job, since there are many areas the politician cannot pay attention to. In the same line, for Chen et al. (2014: 4), the nature of the political game "(. . .) leads to calling for lower managers to prepare decisions and take on leadership roles in decision-making processes." Therefore, it would be the presence of a greater space of discretion which could give greater space of influence to the bureaucrat in the policy-making process. In this sense, when the politician does not engage in a certain policy, he/she leaves the space for the policy bureaucrat to play as a policy maker (Page 2012). It is this lack of political direction in the early stages of the policy process that would explain the high influence of policy bureaucrats upon the policy making process.

When there are greater discretion spaces, policy bureaucrats exert influence through the daily functions they perform. One of such functions is *production work*. According to Page and Jenkins (2005: 60), "(. . .) a production policy job produces some form of draft, statement or document. It is concerned with a one-off task, usually with a written document, or a set of them, as its final product." In relation to the production work, the most important one is related to the formulation of secondary legislation (regulations, decrees, resolutions) for the implementation of public policies, in addition to the writing of reports and papers. Not only does this work involve the elaboration of the policy proposal documents themselves, but also dealing with different interest groups or organizations interested in certain public policies, exchanging points of view through collaborative relationships. As Page and Jenkins (2005) point out, rather than advising ministers on particular initiatives, middle-management bureaucrats have direct responsibility for developing specific aspects of the policies.

Another type of work done by policy bureaucrats is *policy maintenance*, which is related to the realization of "(. . .) making or recommending day-to-day decisions about how a particular

scheme or set of institutions should be handled" (Page and Jenkins 2005: 60). Page and Jenkins (2005) give great importance to those bureaucrats who ensure the degree of compliance with targets committed by certain public services, which is generally associated with monetary incentives. Another realization of this work occurs when bureaucrats seek to ensure that the political decisions of ministries are progressing and are reflected on public organizations daily activities, through monitoring actions. Lahera (2006) highlights the work of the bureaucrats when designing and re-designing problematic issues and reviewing the implementation of policies. Progress reports and "bottlenecks" are required to define what problems will require the attention of politicians.

Finally, *service* policy job is related to providing knowledge and skills advice to policy makers. However, this is not technical expertise advice, but rather is related to the knowledge of organizational processes around the implementation of a policy. The most identifiable activity with this type of work is the advice to the minister or political actor. Lahera (2006) argues that the public policy service is related to: preparation, attendance, and monitoring of meetings of authorities, with other political actors or interested parties; drafting of interventions and texts for the authorities, mainly related to the function of government communication; and analysis of the international press on current interesting affairs. In sum, Lahera (2006: 7) argues that "the main function of the public policy service is to provide a comprehensive and professional perspective to evaluate major decisions, with special attention to criticism."

### Policy Expertise

Unlike the technical expertise evidenced by technocrats and technopols, as a source of influence on the policy making process, there is another type of expertise with which the policy bureaucrat exerts influence. According to Page (2010: 259), policy expertise "refers to knowledge of the range of policies and instruments, present and past, proposed and enacted, governing a particular policy area as well as knowledge of how they work." This could be explained according to what Mintzberg (2009: 9) postulates regarding that "managing is neither a science nor a profession; it is a practice, learned primarily through experience, and rooted in context."

Colebatch (2006) refers to the difference between the scientific expertise of the technocrats and the policy expertise of policy bureaucrats from another perspective, pointing out that the policy bureaucrats more than needing the expertise based on *episteme*, a product of the analytical rationality, need the *techne*-based experience, that is, the knowledge derived from experience and skills. In Colebatch's words (Colebatch 2006: 315), this knowledge "(. . .) is not simply the practical application of epistemic knowledge but is often tacit knowledge which cannot be explicitly codified but which rests very much on implicit personal or institutional practices often associated with craft-like skills, awareness of reputations, and hands-on techniques." In this context, the location of bureaucrats in the middle levels of bureaucracy would favor the development of this type of expertise (Richards and Duxbury 2015). According to Carlstrom (2012), policy bureaucrats act as knowledge facilitators providing context for other employees by sharing information about organizational strategies and fostering interaction between members within organizations.

This policy expertise would also relate to the ability to understand the political environment in which the policy discussion takes place, along with knowledge of how the policy process occurs. In this line, Hoppe and Jeliazkova (2006) emphasize the knowledge policy bureaucrats have of the political process and their skills to operate in these specific contexts and institutions. In this sense, policy expertise would also encompass the possession of skills to facilitate the interrelationship among different actors to acquire and exchange information, to communicate ideas, and to persuade and influence individuals and organizations to support a course of action (Minstrom 2003). Adams et al., (Adams et al. 2015:103) show that the functions of policy bureaucrats are not related to "(. . .) an abstract exercise in modeling problems and demonstrating solutions to them but more about constructing programs of actions and

negotiating the parts played by others participants." Therefore, it is possible to conclude that, together with the knowledge of the political environment, policy expertise is related to the ability to relate to different actors with interests involved in a particular policy, evidencing negotiation, communication, persuasion, and others skills. In this sense, policy work is closely related to the ability to negotiate how a problem will be defined, or what policy options will be developed, and finally decide the course of action. Adams et al. (2015) point out that policy bureaucrats are identified with the functions of "relationships" and "framing." This would show the important influence of the policy bureaucrats on the policy-making process, since "(. . .) who is involved in dealing with the problem shapes how it is framed, and how it is framed determines who might become involved in dealing with it" (103).

In relation to formal training as source of influence of policy bureaucrats, this would not be so important because learning would come from their experience in the same job (Adams et al. 2015). The learning that originates policy expertise would be acquired more in an unstructured and contextual way, and such learning is taught through mentoring and communities of practice (Wenger 1998). Agreeing with Adams et al. (2015), Page and Jenkins (2005: 39) point out that "the expertise of (. . .) the middle-ranking officials might result from their on-the-job experience (. . .) through practical specialization – staying in the same job or moving between jobs that cover similar types of issues." In fact, it is possible to conclude from these studies that a significant number of these bureaucrats stayed for a considerable time in their jobs or moved among other departments and other public services, but in similar areas.

## Conclusion

The influence of bureaucracy during the stages considered more political of the policy making process is a phenomenon that has not been studied much. The research studies on the subject deal mainly with policy implementation. However, bureaucracies exert influence upon the policy making process, through mechanisms such as policy expertise in high discretion contexts.

Due to the above, a research agenda is needed. This agenda should address the political influence of bureaucracy, should also investigate further into the mechanisms used by policy bureaucrats to exert their influence, and should not limit its scope of investigation only to the aspects related to the organizational capabilities of public administration. Knowing the influence of all the actors – political, bureaucratic, or civil society – which influence the process of policy making at all stages, is fundamental to develop a thorough knowledge of the policy making process.

Finally, the results of future research in this field can be valuable input for the training programs of public managers in the public sector, both in governmental institutions and universities, concerning the competencies that need to be developed in these professionals. In this sense, it is important to continue with the training of said professional in expert knowledge, but it is also necessary to develop in them "soft" skills such as persuasion or negotiation, which turn out to be key abilities in the work relationship of these professionals with political actors.

### Synonyms

Administrative apparatus; Machine bureaucracy; Organizational structure; Rigid engine

### Definition

The "bureaucratic machine" is an organizational structure that is rigidly designed to control, efficiency, and economic effectiveness in distributing public goods and services.

The term "bureaucratic machine" largely operates on the procedures and standardization of the work processes in organizations (Lunenburg 2012; Rauch and Evans 2000). It is a complex decision-making tool in public organizations, which seeks to control and protect the public interest by providing little room for personal discretion. The bureaucratic machine has common characteristics in all forms of organizations although it is more prevalent in government institutions.

The term denotes Weberian sense, strict compliance to rules, regulations, procedures, and guidelines in executing public service delivery. The Weberian view similarly connotes a rule-bound system designed to ensure that public office holders adhere to the principles of the public interest by formalizing the procedures in dealing with members of the public on an equal and fair basis. Therefore, the bureaucratic machine encompasses the social structure of an organization and the various control mechanisms put in

place to handle the efficient and effective productions of outputs.

## Introduction

The bureaucratic machine is a metaphor to describe the way work standardization can assume the image of a machine in formal organizations. The bureaucratic machine is an invention of the Industrial Revolution in the eighteenth century, which saw the coming into being of mass production of goods and services in the newly found capitalist economy. Max Weber developed the bureaucratic model that will eventually function like a machine to bring about routinization, efficiency, and effectiveness in formal organizations. The bureaucratic machine is used to standardized organizational procedures to check the discretional use of authority by managers; more specifically, it relates to power and authority that exist in formal organizations which ensure behavior formalization, vertical centralization, limited horizontal decentralization, and specialization (Hendry 1997; Mintzberg 1980).

Weber develops the three types of authorities: charismatic, traditional, and legal-rational that exist in organizations. However, among these three, legal-rational is the most enduring and speedy adaptive authority type in formal organizations. Consequently, Weber derives the bureaucratic model from the legal-rational and terms it as the "ideal type." In Weber's view, the "ideal type" is an abstraction that may not exist in the real world much because his study organization was the German Military, which makes it difficult to be in other organizational forms like in a civilian setting. The standard procedures in the military are in sharp contrast to what pertains outside; hence, it will be an ideal model should organizations choose to implement it in their day-day operations since it is goal-oriented. The bureaucratic machine has some major themes such as the machine metaphor, parts of the bureaucratic machine, characteristics, obsession for control, and dysfunctions. These themes are explored in the remaining discussion.

## The Machine Metaphor

Lawley (2001, p. 1) describes that all theories of organization and management are based on implicit images or metaphors that persuade us to see, understand, and imagine situations in partial ways. Metaphors create insight. However, they also distort our reality (Lawley 2001). Morgan's "Images of Organization," which describes eight metaphors that can be consciously applied for the study of organizations, is a case in point (Morgan 2006). Despite the *machine view* dominating modern management thinking and which is typical of bureaucracies (Morgan 2006), it is still very much grounded in the classical theory works of scholars such as Weber, Fayol, Taylor, Gulick, and Urwick to illuminate the foundational ideas of the universal principles that are followed for an organization to be successful (Itkins and Nagy 2014). These theories are in unison with the machine metaphor. The machine metaphor from the "organization as machine" offers a mechanistic way of thinking about organizations. Also, this metaphor leads to the creation of detailed blueprints for desired changes and invites unrealistic expectations of control which creates anxiety, blame, and defensiveness when events inevitably do not proceed according to plan, thus hindering the work (Suchman 2011).

## Parts of the Bureaucratic Machine

### Lower-Bureaucratic Machine

The lower-bureaucratic machine (LBM) or operating core refers to the street-level bureaucratic processes, procedures that lower-level managers perform in an organization. For example, the LBM is designed to ensure that work procedures are coordinated to link the upper and middle parts in providing goods or services to the citizens. In this kind of bureaucratic machine, the machine functions as a liaison between top management and middle management as well as key stakeholders to the organization. The LBM operates in a simple structure with little room for specialization. The LBM is seen as the simplest part of the machine in which rules, duties, and

responsibilities are clearly defined characterized by full standardization and routinization (Mintzberg 1980; Rauch and Evans 2000).

The LBM serves as the operating core of the machine with routinize workflow and therefore, tasks performed at this level are mostly simple and repetitive with minimum skills, and few hours of training by organization managers. Besides, this level has a sharp division of labor with narrowly defined jobs at both the horizontal and vertical differentiation. Coordination is very weak here due to the narrow or absence of specialization since the processes are highly standardized. However, this machine has a high level of formalization behavior, which is the visible design parameter because the street-level bureaucrat has little discretion in their task performance that may result in little room for mutual adjustment.

Because the LBM is limited by direct supervision due to highly standardized work processes, it poses challenges for the use of discretion by this part of the machine and because of this gap; the use of discretion is ambiguous at this level. Similarly, the right amount of discretional powers used here is depended on the type of task. Sometimes, if the standardization is not clear, it is likely that the flow of work may lack direction because the channels of communications and work rules are often silent on the relationship between street-level bureaucrats and citizens. Because of this pitfall, this part is bedeviled with rent-seeking behavior because there is a disjoint between rationalization and the nonchoice behavior of street-level bureaucrats. For example, the processes of receiving an incoming mail are mostly clear but how service seekers receive at the front desk is left at the discretion of the street-level bureaucrat. The result is an implicit exercise of discretion by street-level bureaucrats especially in countries where a strong administrative culture is absent.

### Middle-Bureaucratic Machine (MBM)

The middle-bureaucratic machine (MBM) or the "administrative component" is a liaison tool that coordinates the lower and the upper bureaucratic machines from disruptive environmental influences (Mintzberg 1980, p. 164). Because the middle machine is an absorption material, it is highly structured and elaborated. However, there are three levels in this machine, middle line, middle-line managers or staff, and the technostructure, and are subdivided for easy coordination and supervision.

The first division is the middle line, which is developed above the lower bureaucratic machine with specialized units and functions. In this first category, managers have three major tasks. First, handle the conflicts that arise among the highly specialized workers of the lower-level machine, second, to liaise with the technical bureaucrats to incorporate their standards down into the operating or functional units. Third, to perform vertical flows in the bureaucratic machine through the aggregation of feedback information coming from the hierarchy and to elaborate action plans that come downward.

Another subdivision is the middle line managers put in charge of the lower bureaucratic machine. The key feature of this submachine is that all the middle-line managers require personal contact with their "direct reports," analysts, and their supervisors. Since the middle-line managers deal with both those under their direct supervision, the analysts as well as their superiors, this relationship invariably limits the number of people they can supervise, suggesting a limited scalar system. However, they have formal authority to oversee the operating or lower-level bureaucrats.

The third division is the technostructure, which is highly elaborate with the growth of the service industry. For example, with the emergence of the industrial managerial staff, technocratic personnel handle services such as marketing, sales, production, and operations management, etc. This is primarily the case because the machine bureaucracy depends heavily on the standardization of work processes for coordination. An analyst who is responsible for standardizing the processes for the lower-level bureaucrats (Mintzberg 1980, p. 165) dominates the technostructure.

There are two fundamental features of the MBM, formalization, and division of labor. First, the rules and regulations are found in the entire

middle machine, for example, formal communication and decision-making follows a formal chain of authority. There is a hierarchy in the reporting relationship throughout all the levels. Second, there is a sharp division of labor in all the subdivisions, especially between the line managers and staff. Also, the division of labor extends to the analysts who design the work and the operators in the technostructure.

### Upper-Bureaucratic Machine

The upper bureaucratic machine (UBM) describe as a strategic apex by Mintzberg (1980) refers to the managers at the top level of the organization. The UBM is responsible for "fine-tuning" the activities of the entire bureaucratic machine. The upper level in large part performs strategic tasks for the entire machine because of the highly centralized and formalized nature of the bureaucratic arrangements, which builds on hierarchical relationships. The strategic apex provides coordination and direction in decision making in the entire organization for the efficient production of goods and services.

The upper level is designed to resolve conflicts arising from the lower and middle levels of the bureaucratic machine to get work done. Another function of this part is to provide direct supervision at the middle level where the work is "more complex and unpredictable than in the operating core" (Mintzberg 1980, p. 168). However, this level has a broader scope and a generalist perspective to operate because of their coordination role unlike others in the bureaucratic machine who are "specialists with a single link in the chain of activities that produces the outputs" (Mintzberg 1980, p. 169). Therefore, the upper level has enormous power because of vertical centralization.

Strategic planning in the organization comes from the top management with broad powers to implement action plans because the bureaucratic machine is a top-down tool for organizational effectiveness. Strategic planning is rationalized and there is a dichotomy between formulation and implementation in executing plans. For example, the upper level formulates the plans and the middle line and the operating core, implement.

## Characteristics of the Bureaucratic Machine

The characteristics of the bureaucratic machine signify that the operations are engineered by surgical precision, the work is broken down to its smallest parts, efficiency maximized, and specialized tasks are simplified and assigned to trained people (Itkins and Nagy 2014). Because the bureaucracy is designed to work precisely as a machine, it can adjust the work processes to improve the products and services of the organization. Additionally, each part has a precise function, which carries out repetitively and without variation resulting in reliable overall performance.

Other characteristics of the bureaucratic machine include merit-based recruitment through competitive examinations, regularized procedures for internal promotion, lifelong tenure, highly regulated and organized reward structures, and career distinctiveness of the public service. These characteristics of the machine metaphor are in line with the Weberian "ideal types" (Rauch and Evans 2000).

The machine bureaucracy is an organizational structure based on a formalized system that is relatively rigid. The machine has a centralized work culture, which is highly formalized with exhaustive written rules, high specialization, standardized job structure, narrow span of management, a tall organizational structure with centralized decision-making (Suzuki and Hur 2018).

## Bureaucratic Machine as a Control Symbol in Organizations

The bureaucratic machine has an obsession for control in organizations and it can be likened to "instruments of domination and control" and rationalization (Morgan 2006). There is a high degree of control of the processes and procedures from the upper to the lower levels to eliminate uncertainty to allow the machine to function smoothly without interruption (Mintzberg 1980).

Control is needed for two reasons. First, control is necessary because the lower level needs to be protected from external forces so that the

outputs from the assembly lines will be processed without interruption. Second, to reduce and contain conflict. The nature of the design of the bureaucratic machine is characterized by conflicts; hence, the control systems are required to bring the machine to an equilibrium. Conflict is present because of the sharp divisions of labor, the horizontal and vertical differentiation, the rigid distinction between line and staff, and the motivational problems arising from the routine work of the operating core permeate in the structure (Mintzberg 1980, p. 167).

## Conditions Necessary for Bureaucratic Machine Effectiveness

A bureaucratic machine is a rational tool used to break tasks in its simple and repetitive form. The conditions that support the bureaucratic machine in organizations are many; however, five are discussed.

First, the bureaucratic machine can work in stable and simple environments. This is because, in complex or organic environments, tasks are highly complex and difficult to rationalize into simple tasks and repetitive routines (Mintzberg 1980, p. 171). Besides, in a fast-changing environment, there are unpredictable outcomes and tasks cannot be simplified and standardized. Second, the bureaucratic machine is mostly in mature and large organizations with highly elaborated street-level bureaucrats that allows for detailed standardization and repetition. Maturity is a prerequisite condition because older organizations will have developed procedures and processes that can support routinization and repetition.

Third, the bureaucratic machine is a self "regulating technical system, since the routinize work is highly formalized" (Mintzberg 1980, p. 171). The technical systems are both simple and partially complex. However, it is designed to support the machine to function effectively. Fourth, the bureaucratic machine can work better in mass production companies. Because in the mass production environment, most tasks are simplified and standardized with large operating workflows that integrate with other chains of production. Fifth, bureaucratic machines are externally controlled. For example, most government institutions are externally controlled from outside the organization because these institutions are accountable to the citizens through their actions and inactions; thus, these institutions are highly rigid in decision making to protect the public interest. The public demands government institutions to be transparent, fair, and open in their decision-making processes, in either hiring, providing service, or promoting employees.

## Dysfunctions of the Bureaucratic Machine

Mechanical, machine-like organizations are closed systems, not open for internal learning and self -adaptation and generally suited for companies with stable product structure and relatively steady market (Itkins and Nagy 2014). Also, it limits organization change initiatives because of the use of outmoded conceptual model such as the mechanistic organization design. The bureaucratic machine is a problematic way to view organizations, comprised as they are, of people. "Unlike in machine parts", people think about their work. Repetition breeds boredom and at the same time, people are curious and stimulated by novelty. Managers working as engineers do not notice this vast creative capacity of their "machine" or harness its ever-present spontaneous experimentation (Suchman 2011).

Further, the bureaucratic machine has an organizational design that tends to favor only the technostructure (see Mintzberg 1980, 1993) not favorable to other fields, like marketing, which is the interface between the organization and the customer. The bureaucratic machine has the technostructure as its key part, uses standardization of work processes as its prime coordinating mechanism, and employs limited horizontal decentralization (Lunenburg 2012). Also, employees who have job satisfaction operate in the organization without stress, have a unity feeling in respect of their job topic, and involve in a real and creative job, in which their talents and abilities are realized yet the bureaucratic machine does not recognize these events in an organization populated by people (Alizadeh and Frizhendi 2013).

## Conclusion

The bureaucratic machine is highly rigid and stalls creativity in government institutions. Because the most task is standardized with little room for the lower-level bureaucratic machine to innovate. It is also characterized by human problems because the bureaucratic machine is designed for the shop floor staff whose tasks are simplified, while most tasks performed by the middle and the upper levels are difficult to do. Besides, at the strategic level or upper level, some tasks are sophisticated and unable to routinize. Although some informal and formal power exists for the analysts in the middle level, and line managers, to use, the formalization and centralization conflicts these differentiations. Finally, the conditions for the success of a bureaucratic machine include a stable and simple environment, mature organizations, highly regulating technical systems. These conditions make it more difficult to adopt a bureaucratic machine in a dynamic and organic environment in a contemporary world.

## Synonyms

Client assessment; Criminal justice system; Decision-making; Enforcement; Frontline workers; Prioritization

## Definition

Bureaucratic policymaking refers to discretionary decisions that are made by the administrative officials during the policy implementation process. Some of these decisions have the ability to change the course of the policy direction or influence its success or failure.

## Introduction

Since the turn of the twenty-first century, there has been a massive expansion of the bureaucracy across the globe. In the United States of America, for instance, one out of five people in employment works in the bureaucracy (Riley and Brophy-

Baermann 2006). In general the scholarship on bureaucratic policymaking can be dissected into three categories, namely: (1) those that see bureaucracy as a recipient of command from the policymakers, (2) those that view the bureaucracy as having a substantial role in the policy-making process, and (3) those that see the bureaucracy as having a complementary role in the policy-making process (Gerston 2015). From the command point of view, the bureaucracy is both a creation and a functionary of the legislature. Its existence and survival depended upon the presence of a secure legislation and executive support. In essence, it is the politicians who make decisions regarding the creation of various administrative agencies as well as funding of the same agencies. Equally, roles played by these agencies are decided upon by the legislature through various enabling legislative statutes. Beyond the aforementioned, the legislature also has an oversight role that ensures which enables it to monitor the implementation of its legislative directives. Consequently, bureaucrats are recipients of command other than makers of public policies.

The second group of policy scholars see the bureaucracy as inherently political and having significant policy-making powers. These powers stem from the fact that once the basic policy decision has been made, it is passed down to the administrative officials who must carry out the remaining steps in the policy process and ensure that the policy objectives are met (Rabin 2003). Commenting on the same issue, C.J. Friedrich noted that bureacratic officials has a number of tactics that they can employ to influence or even subvert the policy objectives (Gerston 2015). To begin with, in light of the fact that more often policy objectives are ambiguous and sometimes conflicting, the bureaucratic executives can use red tape to either delay or defeat policies that are not in their favour. Other than red tape, administrative agents may issue rules and regulation in the pretense of interpreting the enabling legislation, yet in the real sense, they are subtly subverting or altering the policy thrust. Thirdly, they may drag their feet in the administration of those parts of the laws which they disapprove and pressing on those in their favor.

The third group of scholars view the role of the bureaucracy as complementary to that of the legislature in the policy process. These include filling in the details left by the legislature as well as interpreting the laws and clarifying the policy goals. In so doing, however, they must be sensitive to the political ramifications of their decisions. In consequence, they cannot surpass their legislative mandates through an allocation of facilities, budget alterations, doing away with certain services or bring in new ones in the contravention of their enabling legislation or the current political goals.

One of the areas where the debate on the bureaucratic policy-making process has been emotive is the role of street-level bureaucrats in the policy process. This paper applies the street-level bureaucratic theory to the case of road safety policy implementation in the Kenyan capital city, Nairobi. It seeks to find out if traffic enforcement officers exercise substantial discretion in the course of their jobs and the impact of the same on the policy process. The data employed has been collected from police records, structured observation, and qualitative approach. All the data was collected at one point in time, and therefore analysis applied is intended to examine the relationship between variables investigated other than the change in them over time. In particular, it looks at the relationship between types of vehicle prioritized for road safety policy implementation and prevalence of traffic law violations in the same categories of vehicles. Decisions on whether street-level bureaucratic discretion promotes effectiveness or not are made on the basis of whether there is a positive relationship between the indicators of discretion and those of road safety. Consequently, this section is organized into various subsections, after the introduction here the second section provides a theoretical framework for the study, the next session is on the empirical approach and results, while the last section is on the conclusion.

## Street-Level Bureaucratic Policymaking

One of the areas where the debate over the role of the bureaucracy in the policy process has been

emotive is in the street-level bureaucracies. Street-level bureaucrats refer to frontline workers tasked with the responsibility of turning policy objectives into actions. They include the police, teachers, social workers, and other workers in the criminal justice system (Evans 2016). While their role expectation is to execute policy objectives as passed down to them from the policymakers through the bureaucratic executives, in practice, however, these individuals are the ultimate policymakers (Lipsky 2010). To begin with, in view of the fact that street-level bureaucracies are both understaffed and underfunded, they cannot meet all their role expectations. As a result, they must choose among their many deserving clients on who to serve and who not to. The decisions on those who are most deserving and those who are less deserving are made on the basis of the client's social profiles such as age, race, gender, and other sociodemographic indicators (Weible and Sabatier 2017). Even though these profiles are not part of the policy documents due to the fact that street-level bureaucrats regularly rely on them for purposes of simplifying their work with time they became an expression on the policy (Fischer and Miller 2006).

The other challenge faced by frontline workers in street-level bureaucracies is the fact that laws and regulations in street-level bureaucracies tend to be both vague and encyclopedic and the frontline workers are therefore forced to choose among the many laws and regulations to apply and which one not to (Hupe et al. 2016). The choice on which regulations to apply and which one not to apply is mostly dependent on the organization's culture. Faced with a problem, the street-level bureaucrats will often treat it as they have always done it. As a result, some policy domains get to be applied more often than others (Schneider and Ingram 1993). Invariably those policy objectives associated with the policy instruments which are frequently being implemented will be achieved while those that are rarely implemented left behind.

Beyond resource scarcity and the voluminous number of regulations in street-level bureaucracies, their subject matter also promotes discretion. They are expected to respond to the needs of individuals with diverse backgrounds and interest. Their work, therefore, cannot be standardized. Additionally, controlling discretion in street-level bureaucracies is difficult due to the fact that they employ a large number of professionals some of whom such as police constable have their independence guaranteed both in law and practice (Kleinig 1996).

In 2012 Maynard-Moody and Musheno studied traffic police officer as street-level bureaucrats. The study established that traffic officers fit very well into Lipsky's (2010) description of street-level bureaucrats. To begin with, they operate at the intersection between the law/public policies and the citizen. In the second place, they exercise a substantial amount of discretion in the course of their jobs. For instance, they employ discretionary powers to choose who to investigate and who to arrest. Equally, they have decision-making powers over who to threaten and who to arrest. In sum, the police work is more of a product of normative choices as opposed to functionaries of rules and regulations.

While police discretion is fully acceptable and can be used to aid the adaptation of policy objectives to local circumstances as well as prudent utilization of scarce implementation resources, there are instances where the same can be used to promote biases (Vito 2016). In the case of this study, Chitere and Kibua (2004) observed that the police target PSVs for road safety policy implementation due to the fact that they tend to travel by cash on the road. This is often given to the police as protection fee at the traffic checkpoints. This chapter, therefore, examines the relationship between police discretion and road safety policy implementation.

## The Road Safety Policy Process in Kenya

Kenya is one of the countries in the world with a high level of road traffic injury (RTI) rates. According to WHO (2009), RTI rate in the country is 34.4 per 100,000 populations. According to NTSA, yearly, over 3000 people die on the Kenyan roads. RTI is the third leading cause of death

in Kenya (Owidi 2016). RTI has a variety of economic and health challenges. To begin with, it creates stress in the Kenyan health sector that is already underfunded. According to Odero et al. (2003), 45–60% of all admissions in surgical wards are victims of RTIs. They also account for 75% of the patients in the spinal injury hospital. This matter is compounded by the fact that most of the traffic injury patients take more than 1 month in hospitals. In addition to the foregoing, treatment of RTI, for the most part, requires the use of X-rays and theater (Odero et al. 2003).

From the economic perspective, the annual cost of road carnage in Kenya is KES 14 billion. This is approximately 5% of the GDP (Chitere and Kibua 2004). These losses are associated with losses in income when one is disabled, the damages of goods that occur during accidents, and direct and indirect cost incurred by families when they hospitalize their loved one who is a road carnage survivor (Odero et al. 2003). Additionally, most of the victims and survivors of road traffic crashes are persons within their most productive ages. A survey conducted in the Rift Valley Provincial Hospital indicated that 76% of those admitted with injuries resulting from road accidents were between the ages 19 and 49. Related to the foregoing, 76% of road accident victims admitted in Kenyatta National Hospital were between the ages 15 and 44 years. In Moi Teaching and Referral Hospital, the study observed average age of the admitted for road traffic casualties was 30.3 (Odero et al. 2003).

To deal with this problem, a number of policy efforts have been made; to begin with, in 2012 the national transport and road safety authority was established to coordinate road safety policy implementation processes in the country as well as to advise the government of policies that need to be put in place to ensure road safety policy implementation success (Asingo 2004). Additionally, several amendments have been made by the legislation so as to act as deterrence measure for road safety law violations. Notably, in 1993, the Kenya Law Reform Commission (KLRC) reviewed all the traffic laws in the country in order to contextualize them to the changing needs of road users. Similarly, in 2003, the minister for transport amended the traffic act through a gazette notice no 161 of 2003.

The main aim of the minister in bringing forth this new law was to restore sanity in the Kenyan roads. Some of its objectives were to ensure that only qualified people are employed as operators of public service vehicles; the prevalence of accidents would also be reduced by outlawing some of the RTI risk factors such as drunk driving and speeding. To check on fatalities in case of an accident, all vehicles were to be fitted with seatbelts. The intense implementation of this policy legislation brought down the level of traffic accidents by 73% (Chitere and Kibua 2004). Soon after, however, the thing came back to normal. This followed was a transferred to the minister who brought the amendments and oversaw its strict implementation process to the ministry of environment. With an increase in the number of traffic injuries in 2011, new amendments to the Traffic Act were made again in 2012 and later in 2014 (Mitulla and Asingo 2014).

With all these efforts, it is expected that the number of traffic injuries would have gone down drastically. However, this has not been the case. This study uses the street-level bureaucratic theory which is an offshoot of the principal agency theory for purposes of theorization.

## Method

The data used in this study was collected in the Kenyan capital city Nairobi. The study employed both primary and secondary data. On the one hand, the primary data was collected through structured observation, questionnaire survey, and qualitative approach. On the other hand, the secondary data was extracted from police records and statistical abstracts. The respondents for questionnaire survey and structured observation were selected through clustered sampling strategy. Each traffic division was treated as a cluster from which traffic enforcement officer was randomly selected for purposes of questionnaire administration. Similarly, from each traffic division, all the bus stages where public service vehicles could be found and social gathering places

where private cars could be found were listed and study locations selected. The triangulation of the method and sources employed in the study was intended to ensure increased validity of the study findings. With regard to data processing, data collected through closed-ended questionnaires, statistical abstracts, and structured observation were entered into SPSS data editor for the processing. The SPSS filed developed both the descriptive and analytical statistics used in this study were generated. The description statistics were mainly used to explore the frequency of traffic checks among various types of vehicles as well as to document the prevalence of accidents among them. To test the study hypothesis, Spearman's rank of correlations was corrected. The study is based on the assumption that social profiling of road users undermines the policy implementation process. Consequently, the null hypothesis was accepted where a positive relationship was noted between the independent and dependent variable. It was however rejected where there was no significant relationship or where there was a negative relationship.

## Result

Following a brief discussion on the road safety policy process in Kenya, theoretical overview, and the study design, this section presents the study findings. The section is organized according to the study questions. These include (1) which types of vehicles are targeted for road safety policy implementation, (2) which types of vehicles have the highest levels of policy noncompliance, and (3) what is the relationship between those types of vehicles being targeted for road safety implementation and those that frequently violate road traffic laws.

### The Level of Violation by Vehicle Type

In order to find out which types of vehicles are responsible for the highest number of vehicles, trained observers were placed at different strategic places in the city and asked to take note of the violations and types of vehicles involved. This data was later triangulated with those from the police perception survey and accident records. The table below provides a summary of data collected from the three sources.

From table 1, it is noticeable that there is a variation in the prevalence of violations among different vehicle categories. The most notorious vehicle category according to both observation and survey data is the commuter minibuses commonly referred to as matatus. Some of the violations observed among them include overlapping, careless overtaking, and stopping to pick up passages at non-designated termini. Most of these violations are motivated by the desire to make more income. Through speeding and overlapping, the matatus are able to make several rounds to and from the central business district, thereby increasing their profit margins.

Beyond looking at the types of vehicles responsible for the highest number of traffic violations, the study also sought to understand the frequency traffic accidents attributable to each type of road users. This decision has been informed by the fact that according to Gaines and Kappeler (2014), one of the key determinants on whether the police will conduct an arrest or not is the seriousness of the offense. To this end, it is expected that those types of vehicles which are frequently traffic law violations and thereby have the highest level of propensity to cause accidents are more likely to be stopped compared to those which rarely violate traffic rules. To this end, efforts were made during the study to find out which types of vehicles are frequently involved in road traffic accidents. As it is noticeable in the last column of Table 1 above, there are variations in the number of traffic accidents attributed to different types of vehicles. For instance, while there were 384 matatus involved in traffic accidents, none of the government vehicles was involved in accidents. While there could be many reasons why some types of vehicles are involved in traffic accidents compared to others, in light of the fact that most accidents are attributable to human errors, it would be important to find out if there are any variations in the way in which various vehicles are targeted for traffic law violations and the effect of the same. Consequently, the session below discusses the level of

road user targeting disaggregated by the type of vehicle.

## Types of Vehicles Targeted for Road Traffic Policy Implementation

According to Schneider and Ingram (1993), one of the coping mechanisms employed by street-level bureaucrats to bridge the gap between supply and demand for services offered in their bureaus is rationing. This is done by dividing the clients into broad categories on which the decisions on whom among the eligible clients will be rated as more deserving and less deserving are made. Those who are said to be more deserving are thus prioritized for service provision. These sentiments have been echoed by Kleinig (1996) who observed that the police do not have the resources to arrest all the offenders all the time. They must, therefore, select which cases to attend to and which ones not to. It has also been noted that when the police go out for patrol, they are instructed to "strictly watch the conduct of all persons of known bad character". As a result, there are some people who are more likely to be questioned by the police in comparison to others. It is in light of the above observation that the study sought to find out if the traffic enforcement officers equally target all types of vehicles for road traffic enforcement (Table 2) (Mastrofski et al. 2002).

From the figure above, it is noticeable that commercial vehicles including commuter minibuses commonly known as matatus, lorries, and taxis are most targeted for purposes of road traffic

policy implementation in comparison to non-commercial vehicles such as private cars and school buses. One the one hand, transcripts from road users FGD noted the following observation "My vehicle is not branded PSV because when you do that the police will always stop you on the way," reported by one of the taxi drivers who participated in the key informant interviews. These sentiments are similar to those of Chitere and Kibua (2004) who noted that the PSVs are being unfairly targeted for traffic law violation as a result of the police. The reason why PSVs are stopped more frequently than other types of vehicles is the belief by the police that such PSV drivers travel with cash. In light of the fact that normally they are in a hurry to take their clients to their various destinations, in case their vehicles are stopped for inspection, there is a high probability that they will bribe the police so that they are released in time to continue with their business.

## Correlating Vehicle Targeting and Road Safety Policy Noncompliance

According to Kleinig (1996), police discretion is permissible by law in light of the fact that in certain circumstances, use of professional judgment can lead to better results than if the laws, rules, regulations, and procedures were written in a non-flexible manner which cannot be adapted to the prevailing policing context. These sentiments have been echoed by Lipsky (2010). He reckons that street-level discretion is intended to be comparable to triaging conducted by the emergency medical personnel in a war situation. In response to medical supplies, the doctors must choose who among the wounded soldiers will be treated and who will not. In doing this selection, the patients are divided into different categories such as mortally wounded and may not be saved even with medical attention, critically wounded but can be saved with urgent medical attention, and slightly wounded and therefore can service without immediate medical attention. The doctors, therefore, choose to concentrate on the second category of patients so as to maximize on the limited medical supplies. In the same breadth in the criminal justice systems, the police do not have enough resources to deal with all the law offenders. As a result, they are expected to conduct themselves in a manner that helps them to maximize implementation resources. One way of doing this is by targeting those road users who frequently commit traffic law offenses. However, from the data presented in Table 1 and 2 above, road traffic enforcement practice seems to be motivated by other factors apart from efficiency. To ascertain that the observed relationship did not occur by chance, Spearman's tests of correlations were conducted

**Bureaucratic Policymaking, Table 3** Correlating compliance and targeting by road user categories

| Observation | | | Survey | | | Police records | | |
|---|---|---|---|---|---|---|---|---|
| Road user type | Rank T | Rank C | Road user type | Rank T | Rank C | Road user type | Rank T | Rank C |

between the indicators of road safety policy outcomes and those of street-level bureaucratic discretion. The table below provides data on the relationship between a frequency of violations and frequency of traffic checks. The sign T stands for targeting and C for compliance (Table 3).

From the table above, it is noticeable that there is no significant relationship between those vehicles that are frequently targeted by the police and those that are frequently involved in traffic law violations. This is evidenced by the fact that a Spearman's test of correlations between indicators of targeting using data collected observation revealed a negative figure. The same figure was observed when the test was repeated with data collected through road user survey. A further repeat test with data collected from the police records indicated a nonsignificant correlation figure. It is deducible; therefore, that the decision to stop or not to stop is guided by other considerations apart from the desire makes prudent use of implementation resources.

## Conclusions

The study concluded that despite the many policies and regulations that have been put in place to control police discretion, they still exercise a substantial amount of discretion in the cause of their duties. This is evidenced by the fact that not all vehicles are equally stopped at the traffic search points. Some are stopped more frequently than others. It was also noted that once vehicles are stopped, enforcement officers do not spend the same amount of time investigating them. Among those investigated, only a few are processed for further questioning. Transcripts from police officer FGDs indicated that the decisions on which type of vehicle to stop or search, what to search, as well as who to arrest are solely made by the patrol officers. Police discretionary powers stem from three main sources. To begin with, the police do not have adequate personnel to stop vehicles at the traffic checkpoints. Similarly, they cannot arrest all the traffic offenders. Consequently, operational choices have to be made on whom among those suspected of traffic violations will be stopped for traffic checks. Once the violations have been confirmed, only a few of them can be processed for further investigation and prosecution in light of the limited number of other criminal justice officers such as prosecutors and judges as well as correction facilities. As a result, choices have to be made over whom among the suspects to investigate and if the violation is confirmed arrested. The second explanation for immense discretionary powers being exercised by the patrol officers is the difficulty associated with standardization of traffic control services. This difficulty results from unpredictable nature of traffic users, who are the target population of the road safety policy. To this end, each police office must apply their training and experience to deal with each road users as per the prevailing context. It was further noticed that police managers apply very little control over traffic enforcement decisions. Most of these decisions are made by the patrolmen. This stems from the fact that while at every traffic checkpoint, there is always an inspector; due to the first pace of traffic control activities, she/he is not able to monitor and direct all the officers' activities.

The study further concludes that police decision on who to stop as well as who to arrest has a substantial influence on the policy outcomes. The study established that road user's behavior is highly influenced by traffic enforcement behavior. Those types of vehicles that are frequently targeted for law enforcement, in general, tend to be careful on the road. On the contrary, those types of vehicles that are rarely targeted for full enforcement tend to misbehave on the roads. For instance, transcripts from the road user FGDs indicated those PSVs owned by police officers tend to frequently violate traffic laws in comparison to those owned by civilians. It was also noted that matatus are notorious for traffic violations because most traffic enforcement officers are on their payroll. The trained observers noted in certain routes matatu touts regularly throw 2 USD down at the traffic roadblocks and speed off. The police decisions to allow traffic offender to violate traffic rules without due regard is thus responsible for the rising number of traffic injuries in the country. In view of the fact that policy success or

failure mostly depended on the discretionary decisions of the implementing officers, then it is deducible that street-level bureaucrats are the ultimate policymakers. In sum, the application of new management techniques has done little to control bureaucratic discretion.

This failure is associated with the fact that the introduction of new management has not done away with dilemmas faced by street-level bureaucrats during the implementation process. This stems from the fact that environmental factors which call for discretion as a coping mechanism are still prevalent in most street-level bureaucracies. As it is noticeable from the preceding discussions, most street-level bureaucrats still operate in an environment of resource scarcity, their frontline workers lack goal clarity, and their performance management systems are yet to appreciate result-based management system.

## Definition

Bureaucratic politics: a set of theories originating in the fields of public administration, foreign policy analysis, and domestic public policy that focus on the policymaking role of public administrators and bureaucrats.

## Introduction

Theories of bureaucratic politics made critical contributions to the development of public administration through analysis of its policymaking functions, including policy analysis, decision-making, and multiple other functions of public agencies. The origin of bureaucratic politics can be traced to the 1940s. At that time, the field of public administration was dominated by the scientific management movement and advocates of the politics–administration dichotomy. World War II became a transformative event for public administration. Specifically, it was responsible for multiplying government functions, increasing complexity of political and administrative environments, and enlarging numbers of bureaucrats holding political positions which required much more than merely implementing policies set by elected politicians. The orthodox public administration postulate, which held that administration should be separated from politics, did not correspond with the reality of the postwar period.

Dwight Waldo (1948) was one of the first scholars who harshly criticized the politics–administration dichotomy. In response to Woodrow Wilson (1887), who advocated for analytical distinction between politics and administration, Waldo proposed a concept of the administrative state. According to Waldo's concept, functions of public servants moved beyond the mere execution of laws developed by elected officials and into their contributive role in policymaking. Waldo also indicated that in democratic societies, policymakers should be guided by such values as representativeness, political responsiveness, and accountability. Similarly, Appleby (1949) and Long (1949) underscored the importance of the involvement of bureaucracies in the process of policy formulation and implementation. This conceptualization of the administrative state helped the field overcome the limits of orthodox public administration by underlining increased cooperation and intensive interactions between elected and appointed officials in governance.

The sophisticated nature of bureaucratic politics is reflected in a set of various functions that public administrators perform in contemporary governments. David Rosenbloom (1983) distinguishes three types of functions within public administration: managerial, political, and legal. Moreover, Rosenbloom argues that all branches of government have been collapsed into the administrative branch. In other words, apart from an executive function related to the implementation of rules, public administrators also perform a legislative function of making rules and a judicial function of adjudicating issues concerning their application. These functions are closely related to the key pillars of public administration, namely, politics, organizational design, and law, distinguished by Alexander Hamilton, one of the founding fathers of the United States. Furthermore, ethics represents another pillar of public administration that has become increasingly important within the executive branch which is characterized by complex combinations of governmental functions traditionally performed by other branches.

Bureaucratic politics is a multifaceted phenomenon. Various perspectives on bureaucracy and its functions give specific contexts necessary for envisioning intricate connections between crucial elements of bureaucratic politics. In his study of the US administrative state, Ali Farazmand (1989b) points to the key instrumental role that bureaucratic politics plays in the process of achieving the goals of other types of politics, including group politics, partisan politics, and policy politics. From this perspective, public administration can be defined as internal organizational politics of bureaucrats who decide what programs and policies to implement in order to achieve particular political goals. This perspective covers both the policy formulation and policy implementation stages. Another perspective (Farazmand 1989a) analyzes bureaucratic politics in terms of the use of power and authority by bureaucrats to achieve personal and political objectives. Yet another perspective focuses on the bureaucratization process, which is aimed at centralizing power structures and gaining authority over administered populations. Bureaucracy is

also a powerful tool in maintaining the political system and an important means of governance for those who rule society (Farazmand 2010). The key point is that these perspectives are not mutually exclusive but complementary. Their integration provides the big picture of bureaucratic politics.

## Bureaucratic Politics and Foreign Policy

In foreign policy analysis, the theory of bureaucratic politics received much attention after an attempt to apply it to the study of the 1962 confrontation between the United States and the former Soviet Union, known as the Cuban Missile Crisis (Allison 1969). To analyze foreign policy decisions, Graham Allison (1969) offered three "conceptual lenses" or frameworks: the rational actor model, the organizational process model, and the bureaucratic politics model (sometimes referred to as the governmental model). The essence of bureaucratic politics becomes clear through its comparisons with other models.

Based on his analysis of the Cuban Missile Crisis, Allison demonstrated the limitations of the rational actor model that explains decision-making in terms of strategic calculations made by states. According to this model, states operate as rational value-maximizing unitary actors who make their decisions based on market factors that represent incentives and threats created by other foreign actors in the international arena. This precondition, however, fails to explain strategic miscalculations of the Soviet and US decision-makers during the Cuban missile crisis.

Allison's critique of the rational actor approach to decision-making draws heavily on Herbert Simon, who introduced the concept of bounded rationality in the 1940s. Simon (1946) argued that the decision-making analysis should take into account several sources that limit rationality of actors, including unconscious individual habits and reflexes; cultural constraints and values, such as loyalty and morale; and imperfect knowledge. These constraints, coupled with the increasing complexity of governmental functions, explain multiple inefficiencies within the bureaucratic process. Other influential public administration scholars who analyzed constraints and inefficiencies in domestic policymaking (March and Simon 1958; Lindblom 1959; Neustadt 1960; Downs 1967) made further contributions to the development of Allison's models that focus on the role of bureaucracy in the foreign policymaking process.

Unlike the rational actor model, the organizational process model presupposes that international actors are not represented by unitary states but by a constellation of loosely allied organizations presided over by government leaders. This model focuses on the nature of bureaucratic organizations that operate according to their standard patterns of behavior and norms. According to this perspective, foreign policy can be seen as a function of organizational routines, operations, and procedures within large bureaucracies. Furthermore, the bureaucratic politics model underscores the idea that organizations are composed of individuals who act not in accordance with a consistent set of strategic objectives but rather based on various conceptions of national, organizational, and personal objectives and goals. According to the bureaucratic politics model, foreign policy is a byproduct of bargaining games between principal decision-makers in the international arena.

The organizational process and bureaucratic politics models offer significant improvements in prediction of foreign policy decisions in response to actions by other states, compared to the less realistic rational actor model. Moreover, both the organizational process and bureaucratic politics models allow for explanations of strategic miscalculations on the part of state actors through analysis of their specific organizational processes and bureaucratic procedures. Yet, the bureaucratic politics model received far more attention in the field of foreign policy analysis than the organizational process model. The popularity of the bureaucratic politics model can be attributed to the fact that it added a new layer of complexity to the understanding of contemporary governments. Specifically, a bargaining approach

that lies in the center of this model requires an understanding of fundamental principles of negotiation, which are critical for analyzing interactions between actors in all organizations, particularly in large bureaucracies. In terms of foreign policy decisions, identifying common interests and mutual benefits for the involved parties requires some concessions, with the resulting decision producing a condition that is acceptable to all sides.

In comparison with other models, bureaucratic politics is more accurate in depicting decision-making at the state level thanks to its emphasis on multiple actors holding various government positions. Several works published in the 1970s applied the bureaucratic politics model to numerous case studies of both domestic and foreign policy actions to demonstrate its explanatory potential and descriptive accuracy (Allison 1971; Allison and Halperin 1972; Destler 1972; Halperin 1972; Halperin and Kanter 1973). Most importantly, Allison and Halperin (1972) refined the bureaucratic politics model by enriching it with some elements of the organizations process model. They proposed a new paradigm of bureaucratic politics. According to this paradigm, governments represent a network of organizations whose choices are impacted not only by personal values, motives, and intentions of individual actors in the leading positions but also by internal procedural constraints, imperfect information, and external pressures on the organizations represented by these leaders. Later, Allison and Zelikow (1999) refined the original analysis of the Cuban Missile Crisis based on new materials and declassified tape recordings of the U.S. government's proceedings.

In terms of policy implementation, actions on specific governmental issues are taken through action-channels. The latter represent regularized sets of procedures that provide bargaining advantages and establish rules for political interactions. Action-channels structure bargaining games through formal processes for producing government action or through informal processes organized on an ad hoc basis. The success of any particular player in the negotiation process depends on his advantages, his skills in employing these advantages, and other actors' perceptions about his ability to influence the decision-making process. Allison and Halperin (1972) emphasized an essential role of action-channels in bureaucratic politics in determining a set of players, their advantages and rules governing the decision-making process. The resulting governmental decisions and actions reflect collective choices made through bargaining games between key players.

## Critique of the Bureaucratic Politics Model

The theory of bureaucratic politics expanded the theoretical debate in the international relations and political science disciplines. It also contributed to the development of the decision-making theory related to policymaking by introducing new insights derived from organization theory and psychological approaches to organizational behavior. However, it also sparked much criticism. As Allison (1969) indicates, the key limitation of the bureaucratic politics model is its enormous complexity, with often overwhelming information requirements related to individual decision-makers and superfluous details of their bargaining. Thus, the very same feature that allowed this model to provide more realistic explanations of public policy decisions and actions, simultaneously served as a constraint to its widespread applicability as an analytical tool in cases characterized by incomplete and imperfect information about key decision-makers, their motives and intentions.

Some scholars pointed to the ambiguous and imprecise nature of the bureaucratic politics model (Art 1973; Bendor and Hammond 1992). In most cases, it is extremely difficult to disentangle factors related to personalities, bureaucratic or organizational dynamics. Organizations represent complex networks of formal and informal norms, routines, and operational procedures. Therefore, the application of the bureaucratic politics model to organizational analysis requires significant

efforts in distinguishing between the overlapping effects of different factors related to their formal and informal environments. In the same vein, motives and intentions of individual actors within organizations can be subject to different interpretations.

In addition, the original bureaucratic politics model failed to fully incorporate other factors related to external pressures outside the executive branch on governmental organizations and their leaders, including the impact of Congress, partisan politics, interest groups, and public opinion. Although Allison and Halperin (1972) recognized the impact of Congress and public opinion on the bargaining, they did not provide a comprehensive framework to analyze their influence on the decision-making process. At the same time, incorporating additional external factors into the model is necessary for coherent explanations of the entire governance process within contemporary governments.

The key challenge inherent in the bureaucratic politics paradigm is the integration of various theoretical insights derived from multiple conceptualizations of bureaucracy. In this respect, Timothy Conlan et al. (2014) provided a framework that helps integrate the roles of bureaucracy, political parties, interest groups, policy experts, the media and the public in the contemporary policy process. They represent the policy process as a set of four different pathways of policymaking – pluralist, partisan, expert, and symbolic – that rely upon distinctive sources of power, appeal to specific political audiences, and employ unique strategies and coalition building methods. While the partisan pathway is based on a strong party leadership and the president, the pluralist pathway involves a continuous struggle between different interest groups. Bureaucrats, together with other policy experts, employ the analytic pathway to policymaking based on ideas developed through their professional expertise. Finally, the symbolic pathway is based on popular ideas that appeal to common sense notions and moral values of the general public.

Taken the complexity of the political environment into account, many legislative initiatives switch tracks at different stages of the policy process. In fact, it is quite usual for enactments to move along different pathways at each stage of the policy process. Within each policy domain, major policy enactments tend to evolve from one pathway to another over time and there is strong empirical evidence that bureaucrats have been increasingly engaged in policy agenda-setting and policymaking (Bardach 1998; Kingdon 2003; Conlan et al. 2014). This trend constitutes a dramatic change in the nature of the policy process and the growing influence of contemporary bureaucracies on political and socioeconomic development.

## Conclusion

Theories of bureaucratic politics underline that the complexity of the political and administrative environments blurs the demarcation line between politics and administration in the real-world situations and, as a result, bureaucrats have to perform multiple functions that go beyond the execution of laws. Bureaucratic politics theories address different aspects of the participation of public officials in policymaking. In particular, bureaucratic politics scholars seek to explain how public policy decisions are made within bureaucracies, how different functions collapse in public administration, and how administrators can acquire knowledge and information necessary for policymaking. These theories capture various dimensions of bureaucratic behavior and different functions of public agencies, and their full potential is realized through their integration and exchange of ideas.

The significant strength of Allison's model of bureaucratic politics (1969) is its detailed accuracy of implications related to the impact of national bureaucracies on the public policy process. Yet, the overall complexity of this model often makes predictions of actions by state actors extremely difficult. There are also some concerns related to accountability within the bureaucratic politics model. If policy decisions are the result of bargaining games between multiple actors, it raises the question of who holds the ultimate responsibility for these decisions. The

accountability challenge arises because public actions impose substantial discretionary authority in entities other than those with ultimate responsibility for the results. The sophisticated nature of political accountability of bureaucrats and their professional responsibility reflects complex relations of bureaucracy with other stakeholders in democratic societies. Studies of multiple accountabilities in public administration (Romzek and Dubnick 1987; Posner et al. 2014) indicate critical roles of other actors in ensuring bureaucratic accountability, including the public, the media, and courts. Similarly, theories of representative bureaucracies developed by Kingsley (1944), Krislov (1974), and Selden (1997) seek to reconcile the hierarchical bureaucracy with democracy through its passive representation of the society and its active translation into policies.

Bureaucratic politics and accountability remain central issues in public administration. This can be explained by the fact that professionally competent and accountable bureaucracies are the necessary basis of effective and responsive administration in democratic societies (Farazmand 2010). On the one hand, bureaucrats have discretion to perform functions related to policymaking based on their independent judgment and professional expertise. On the other hand, accountability does not allow bureaucrats to abuse their discretion by holding them responsible for their actions before external authorities and nongovernmental actors. In other words, accountability is the obligation owned by bureaucrats to the public, who is the ultimate sovereign in constitutional democracies. This is why effective and responsive administration requires a balance between bureaucratic discretion to perform policymaking functions and accountability.

# Bureaucratic Power

Barbara L. Neuby
Department of Political Science and International Affairs, Kennesaw State University, Kennesaw, GA, USA

## Synonyms

Accountability; Administration; Administrative state; Bureaucracy; Public service

## Definition

Bureaucratic power refers to the administrative capability to successfully carry out the intent of the legislature that created it. Power includes the ability to write rules, enforce them, and adjudicate disputes. It also includes the ability to influence those legislative bodies in order to receive a sufficient budget so that the agency may continue to operate.

## Introduction

Mention the word "bureaucracy" and peoples' eyes glaze over and they turn away. Bureaucracy – the administrative offices juxtaposed between the executive and legislative branches at all levels of government in every nation – is the most numerous form of government but also the least understood. Most know that legislatures make laws and executives are ultimately responsible for enforcement, but few think about implementation, about what is required to provide the myriad range of services and programs that are delivered today.

A bureaucracy by any other name is likely the same animal: "board," "bureau," "agency," "commission," "administration," "civil service," or "authority." Regardless of name, bureaucracies are an essential institution of modern life, pervasive and powerful even to the point of being sacrosanct. They are feared, derided, blamed for our failings, and, occasionally, granted credit for a job well done. When we hear "bureaucracy," most of us think waste, corruption, or mindless rules despite the fact that the good that bureaucracies do far outweighs the bad. The administrative literature describes it, bemoans it, threatens it, extols its virtues, and, between the lines, warns of bureaucracy's ever-encroaching power and relentlessly growing influence. We sometimes criticize that which we know little about. In many countries including the United States, efforts are under way by public employee groups to take action to restore employee morale. Most of the time, agencies seem nameless, faceless, opaque entities known only to the initiated: the legislatures with whom they work, the high level staff that run them, and the lobbyists or claim seekers with whom they come in contact. Generally, not even their clientele understand them. Their size and tenure, mystique, complexity, essential nature, an apathetic public, and lack of legislative and executive oversight combine to put the bureaucratic class firmly in positions of power that is most often well used.

## Size and Tenure

German sociologist Max Weber is credited as the father of modern bureaucracy likely because he formalized its definition (Weber 1922). Weber said all bureaucracies have the common elements: hierarchy, specialized job functions, expert training, lifetime positions, written documents, societal status, and standardized rules. His theory is widely accepted. Wherever one looks, one can find agencies with these same essential traits, and bureaucracy has been in it since day one. From the Greek and Roman city-states, the

Chinese dynasties, to the European war machines of the post Renaissance age, the far-flung provinces, the armies, services for the growing middle classes, all had to be managed. Bureaucracy has been the preferred method of program implementation for well over a thousand years as leadership by military and royal officers gradually gave way to administration by trained staff. One could make a strong argument that it was the development of bureaucracy that allowed emergence of the modern nation-state for without bureaucracy, programs and plans could never have been carried out, territory would not have been conquered, and revolutions could not have been sustained.

Today, bureaucracy is Hobbes' *Leviathan* (Hobbes 2010): sovereigns fear the weight of a rival when trying to change it. In 1887 then Princeton University President Woodrow Wilson (later President Wilson) wrote that there was scarcely any area of life left untouched by government and was concerned that government had grown beyond our means to manage it well (Wilson 1887). Wilson would likely do a double-take today at the range and number of national departments and agencies in every country, each with many suboffices and each suboffice with still more sub-suboffices and special commissions and bureaus and boards and so on. As new needs arose, new agencies were created. Federal ministries of health, departments of education, and disaster response, and nuclear power regulation were all newly created agencies delegated by their legislatures to serve specific needs. At the US national level alone, there are over 2,200 agencies, departments, bureaus, etc., and this growth pattern is ubiquitous in every nation whether a democratic republic (the United States and India), a socialist democracy (European and South American nations), a communist system (Russia and China), or an Islamic theocracy such as Iran. The size and structure of bureaucracy in US state and local governments run a close second to that of the national level. In the United States, there are about 87,000 separate units of government: one national level administration, fifty state administrations, 3,000 county governments, 19,000 city governments and about 65,000 additional entities including about 40,000 public authorities, and "special districts" in a dizzying array of administrative services. Nations operate on the backs of their agencies because agencies are the purveyors of the services, programs, benefits, initiatives, agendas, studies, and militaries that form each country's cultural, political, and social self. They are essential to a modern state and society, and this stature is recognized by the fact that the study of administration is a field in its own right. In the last 40 years, schools of public administration have been created in every nation, granting advanced degrees in the field. In France, the prestigious Ecole Nationale d'Administration is devoted to training senior civil servants who will likely serve in one or more agencies their entire life. Such training only serves to elevate the importance and power of the profession, much as Weber and Wilson imagined it.

A glut of global administration exists as the word "international," "world," or "global" now precedes the names of many organizations that claim hegemony over some particular area of life. While the United Nations has been around since 1948, the offices, panels, and councils that stem from it have grown 100-fold since then. As few examples, there are the World Health Organization (WHO), the International Atomic Energy Agency (IAEA), the Intergovernmental Panel on Climate Change (IPCC) and the United Nations Education, Scientific, and Cultural Organization (UNESCO), the International Criminal Court, the World Trade Organization (WTO), the International Monetary Fund (IMF), and the Bank for International Settlements (BIS), and hundreds of global nongovernmental organizations like Human Rights Watch and Amnesty International. In addition we have regional supranational governments, each with their own huge bureaucracies: the European Union (EU), the African National Congress (ANC), the Organization of American States (OAS), and the Association of Southeast Asian Nations (ASEAN).

## Power

Power is a dirty word. Few admit they want it but when they get it, they will do anything to keep it. Those who have it will deny they have it but will continue to use it. Many will try to get it but

few will use it wisely. Scholars of bureaucratic power discuss it either in terms of the ability to achieve results or the types of power wielded within the organization's environment (Katz and Kahn 1966) or see power as a game of influence among all parties within and without the agency (Mintzberg 1983). Power includes the ability to get done what you want done when and how you want it done. It includes knowledge, skills, and access to both or other resources including people or agencies that have them (Kanter 1979). Legislatures enable (empower) bureaucracies for four purposes: to regulate, to grant benefits, to research, or to track and record. Within each enabling act, there is an intelligible principle that directs the agency to a particular purpose, clean air or disease research, for example. The law, or enabling act, also has to include a "standard" or a condition or moment in time when the agency is supposed to take action. Thus agencies must carry out legislative intent; however, they are also empowered to write their own rules for carrying out that intent. Here, agencies establish additional power because they not only write their own rules but also create their own processes for making the rules, taking public comments, holding hearings, compiling records, designing processes for enforcing the rules previously written, and adjudicating disputes over these rules. What could be more empowering? Each activity can create layers of opacity beyond which only certain educated stakeholders can see. Rules and processes have the force of law, they are legal power, and the rules become de facto policy. Long-standing bureaucracies have enough status and power to move policy agendas, and they amass huge databases by which to deliver these services and benefits – databases that are under control of each agency and practically inaccessible by their sheer size, complexity, and location. Bureaucracies can change lives – even societies – when one considers that rules affect issues such as industrial or labor practices, healthcare, food and drug safety, tax collection, and weapons manufacture. This is tremendous power for those who are not elected.

Furthermore, agencies have discretion *not* to act. Though agencies may be empowered by law to act at a certain point, they may decide it is not the right time, or they need more information, or politics invades their decision making. Agencies in Europe or Australia may test some food additives but not others, for example, potentially leaving the public at risk. In 2010 the Minerals Management Service under the US Department of the Interior failed to hold oil drillers to the statutory requirements for drilling in the Gulf of Mexico. As a result, the Deepwater Horizon well blew out, killing 11 and spreading millions of gallons of oil across thousands of miles of gulf waters, causing the deaths of millions of animals and disrupting thousands of coastal businesses and state economies. The power of one small agency failure is potentially catastrophic.

## Essential Nature

Yet the benefits and services agencies render are basically essential: sewer systems, pension programs, prisons, or product safety. Many could not live without medical vans for disabled individuals, debit cards for food, or nursing home placements. Few of us are well-informed of the kinds of research bureaucracies carry out nor could they discuss research processes, yet we are comforted when the World Health Organization or the US Centers for Disease Control informs us the outbreak is over. We depend on our agencies worldwide to keep us safe from the next terrorist attack, and our dependency enhances agency power. The great US Supreme Court Justice Oliver Wendell Holmes said, "Taxes are the price I pay for a civilized society" (1927). Animal control, welfare, bank regulation, and air traffic control are essential services embedded in all societies, and for most of this, we depend on bureaucracy. Goodsell, in his 1994 polemic on public administration, reminds us that most of what we hear of bureaucracy is through the ratings-driven media, and generally, it is bad news (Goodsell 1994). Search any newspaper and one will find numerous headlines regarding bureaucracy, many of them negative. When we hear about fraud and waste

much of the time, the report is really about those abusing legitimate government programs, not about the need for the program itself. In addition, Goodsell reports that of numerous studies on bureaucracy's expansion, in general, agencies are not, in themselves, responsible for expanding their power. The growth is due to public demand for new services that the public feels are essential during times of socioeconomic upheaval (Neiman 2000). Though we demand services, we often disparage those who provide them, and often the criticism is due to public misunderstanding of bureaucracy's purpose and process as Goodsell points out. In fact, empirical data about administration as a field does not support broad or deep criticism. It is a case of one bad apple spoiling the whole barrel.

## Legislative and Executive Oversight

Legislators and executives can keep bureaucracy under a watchful eye through a wide variety of means if they so choose. As most legislative bodies created agencies, so, too, can they abolish or "sunset" them. Funding can be reduced, a new enabling act can change the agency's mission and goals, and agency leaders can be terminated. It is not uncommon for legislators to contact agencies themselves and make specific requests. The same goes for the chief executive who can remove officials he or she has appointed. When agencies appear to have failed their mission and publics, legislators hold hearings. Agencies are engaged in a constant tug-of-war with legislatures over jurisdiction, the appropriate interpretation of the law, and the enforcement tactics they wield. Executives appoint special investigative committees. Examples of this oversight method include recent US congressional hearings into the failure of the Veteran's Administration to serve returning service members suffering from illnesses or the European Union parliament holding hearings with the various settlement agencies on the Middle Eastern refugee crisis. Article 2 of the US Constitution allows the president to request in writing the opinions of the executive departments on any of the duties to which they have been assigned. Similar statements afford power to leaders of other countries to peek into the inner workings of their administrative state. Together, legislators and executives can rein in bureaucracy through the passage of laws like the *Administrative Procedures Act*, Title 5 US Code, that lays out ground rules for agency behavior and through the appointment of special counsels to investigate bureaucracy. The Governmental Accountability Office (GAO) is one such, permanent office that regularly audits and reviews the many programs the US bureaucracy delivers. In addition, as situations arise, specific laws are passed to limit an agency from taking a particular action in a particular case. Such laws are passed by legislative bodies throughout the world on a consistent basis. One needs to remember that the president or another in a similar position, a prime minister or premier, usually has the power to issue an executive order with such order directing an agency to take particular action. If the executive is not satisfied with the agency's response, he or she can remove its leader.

The judicial branch also wields power to control agency behavior after the fact through cases regarding bureaucracy that make their way into a judicial forum. The realm of case law involving bureaucracy is called administrative law and is a field of legal study in its own right. Furthermore, most agencies have an internal watchdog called an "inspector general" (IG) whose goal is to keep the agency on track to properly deliver its mission, and IGs, as they are called, routinely issue public reports that at the very least call attention to any possible wrongdoing. Whistleblower protection laws also afford agency employees the safest chance to bring errant behavior to light, and media is all too happy to portray the agency on its news broadcasts.

## Conclusion

In 1948 when Dwight Waldo wrote *The Administrative State*, he hinted that the burgeoning

power of administration worldwide would one day become problematic (Waldo 1948). Whether the growth of bureaucracy, its characteristics, its delegated powers, the means of operation, its expertise, control of information, and our dependency on its performance have combined to present a power problem is an open question. The answer likely depends on the types of benefits and services one receives: where you stand depends upon where you sit, or "Miles' law." The number of studies on the power of administrative agencies, the numerous inspector general reports from within the agencies themselves, and the Governmental Accounting Office reports that call out agency behavior all evidence the fact that agency power is a concern to many. The scholarly literature abounds with prescriptions for control yet we have not controlled it. Nearly every organization has an internet presence, a website, yet most still cannot explain agency missions or processes and many do not care to know. Though without bureaucracy it has been shown that the private market fails to deliver essential and other desired services, leaving society in a sort of survival of those who can pay. The government performance movement of the 1990s that attempted to make bureaucracy more efficient and accountable was a step in the right direction. It is often true that lack of legislative, executive, and public oversight allows administrative offices to veer off course. An unidentified early American statesman said, "The price of democracy is eternal vigilance," yet we are not vigilant to the degree needed to support and guide administrative efforts in most cases. However, in most cases, we do not elect administrators and can only control them through voicing concern to the representatives we did elect.

As Waldo rightly noticed, proper administration must be connected to every major realm of human learning. An interdisciplinary effort to be sure, the answer to the general question, of bureaucracy's proper balance of power is twofold. We must not only examine administration's growth and power but set for ourselves a functional limit on the realms we assign to it. To expect more services from government on one hand and then complain because bureaucracy harbors too much power is disingenuous. However, the complexity and opacity of administration belies the need for the public to referee its operations. It is not only a question of "the tasks of government," but also one of the appropriate exercises of power. Only after that limit is recognized can we then devise a better mechanism of adjustment. The means and the ends are intertwined. As administration covers every realm of life, so, too, must each field of study contribute to solve this dilemma. Law, politics, sociology, history, psychology, the humanities, perhaps even the natural sciences can contribute to a road map that could guide us to a healthier level of the distribution of power.

# Bureaucratic Red Tape

Hatice Altunok
Abant İzzet Baysal University, Bolu, Turkey

## Synonyms

Bureaucratic pathology; Bureaucratism; Bureaucratic Hegemony; Citizen Dissatisfaction; Delay in Public Services

## Definitions

Bureaucratic red tape is a concept that points to the negative aspects of the bureaucracy which may refer to factors such as excessive work load and excessive use of documents.

## Introduction

Bureaucratic red tape is one of the main causes of citizen complaints. Administrative activities, processes, and procedures may be seen as mere policy outputs for bureaucrats, but for citizens, they are main causes of negative feelings towards public administration. This chapter presents the definition and the scope of bureaucratic red-tape, includes a theoretical approach, and provides important aspects of the causes and results of it.

## Meaning and Scope of Bureaucratic Red Tape

Bureaucratic red tape recalls the negative aspect of bureaucracy which was structured as a rational organization model aiming at productivity. For the scope of this association, it would be useful to search for the scope of red tape in the dictionaries of other languages instead of searching for discussions made on the theoretical ground of bureaucracy, because red tape is one of the globalized words which has a similar negative meaning in different societies. The word red tape is defined in Webster Dictionary as official routine or procedure marked by excessive complexity which results in delay or inaction. Turkish equivalent of red tape is defined as giving unnecessary importance to the form in the implementation of governmental works and as bureaucracy. German equivalent of the word is bureaucratism and paper fight. At this point, paper fight indicates unnecessary correspondences between civil servants; and bureaucratism is defined as all narrow-minded formal thoughts and actions occurring in a hierarchy. In Russian, red tape is defined as paper works which prolong, take time, and tire out. In Chinese, it means delaying a work, postponing a work, and piling documents. In Japanese, it has different meanings such as secrecy, troublesome procedures, and formalism. In French, the word red tape indicates excessive work load and excessive use of documents. As observed, different meanings of red tape in different languages attribute negative meanings to the term. Bureaucratic red tape emerges when basic features of bureaucracy such as keeping records through documents, obeying the rules, and formality stop being a tool, and they are taken as the aim by civil servants who are executives of bureaucracy.

Beside its meanings as state governance, management regulated by objective rules, and way of organization, red tape connotes many negative meanings. For instance; red tape leads to walking away from responsibility and possession of more authority than bureaucracy should have. The scope of one of the definitions of bureaucracy is defined as a general insult that is used to attribute to ineffectual organizations surrounded by red tape (Shafritz 2004: 34). Bureaucratic red tape is a narrative that points out to the negative direction of the bureaucracy that is used in different forms as bureaupathology and bureaucratism (Durgun 2016: 44–45). The term red tape recalls the same negative meaning whether it is used with the adjective bureaucratic or not. In some cases, it is observed that the term is used directly instead of bureaucracy. This is in fact related to the fact that the bureaucracy gained an arrogant reputation over time, and in the fulfillment of the tasks, it is mostly in the foreground of red tape, delay, corruption, and stifling processes (Farazmand 2010:

246). This situation aroused from the fact that bureaucratic mechanisms generally meet citizens with its qualities such as delay, preclusion, and detention instead of its structural and processual aspects.

## Theoretical Approach on Bureaucratic Red Tape

The terms emerged in Britain in the seventeenth century. Official papers were tied with a tape of which color was similar to red. The term red tape was used to describe these tapes used to tie documents. With its current meaning, the term is the symbol of excessive formal processes and excessive attention for the routines written as prescription. Although the tape practice was abolished, its connotation has been still related to the practices that it has symbolized. In his work *Red Tape: Its Orgins, Uses and Abuses* (1977), Herbert Kaufman structured this term as the practice of organizational processes and surprising diversity of the qualities. The theoretician of organization, Alvin W. Gouldner, described the term as alienation, personalization, and rules and regulations which prevent bureaucracy. Political scientist Herbert Kaufman attempted to explain why red tape has been generally used in a negative scope. He stated that red tape has been generally used in the same meaning with procedures, rules, and regulations. Red tape has been characterized with paying excessive attention to bureaucratic procedures, obeying the rules in a mechanical way, and attaching excessive importance to formalities and routines. In other words, it is the compilation of vast amount of information which is irrelevant to the issue and results in delay and inaction (Shafritz 2004: 252; Chandler and Plano 1982: 216–217).

There are two different perspectives of red tape in theory. These are rule-based red tape and red tape as bureaucratic pathology. Rule-based red tape (A Rule-Based Concept of Red Tape) is considered to be about formal rules, regulations, and procedures created by organizational members who are in official positions of bureaucracy. In this perspective, the dominant opinion is that red tape originates only from official rules, regulations, and procedures; but it can be considered as a narrow-minded opinion. It is not useful to use the term red tape for every organization problem. In the perspective of red tape as bureaucratic pathology (Red Tape as a Bureaucratic Pathology), it is considered that the term red tape is a pathology. This opinion is appropriate for the popular usage because citizens and organizational officers rarely think that red tape has positive aspects (Bozeman 1993: 278–279).

First empirical studies carried out on red tape were conducted by Buchanan, Rosenfeld, Kaufman, and Baldwin. Pandey and Scott presented a summary about theoretical and operational definitions of red tape mentioned in these studies. It was stated that there was not a clear definition of red tape in the study of Buchanan (1975). In addition to this, they discussed about red tape because of the excessive emphasis on procedures and rules and processes in governmental organizations including federal institutions. Rosenfeld (1984) defends that red tape is measured best through perceptions. For this reason, he stated that red tape can be understood best as a problem of personal perceptions instead of a definition of objective criteria. He defined red tape as excessive, ungainly, and meaningless guidelines, procedures, forms, and governmental interventions which are about making and implementing decisions. Baldwin (1990) defined red tape in two types. The first one is formal red tape which was described as limitations of the liberty of an organization originated from laws, rules, regulations, and procedures. Informal red tape, on the other hand, is the limitation of the liberty of an organization which results from the effects of the key institutions in the political system. Media, public opinion, political parties, interest groups, and public officials were considered to be key institutions (Pandey and Scott 2002: 557–580).

## Causes and Results of Bureaucratic Red Tape

Two primary opinions about the reasons of red tape are as follows: rules are poor and good rules do not work well. In the opinion that rules are

poor, very few studies discuss whether red tape emerged as a result of the nature of rules of as a result of the transformation of rules. In the beginning, red tape rules have the characteristic that some rules were born with their red tape nature which means that they create burdens without any aim; their nature is red tape. Reasons about the existence of these rules are as follows: lack of perception, exaggeration, negative-sum agreement, exorbitant control, and negative-sum process (e.g., "democracy can never be more than necessary"). The opinion that good rules do not work well focuses on why functional rules have transformed into red tape by losing their functional characteristics. In this perspective, it is important to understand bureaucratic pathology as well as to understand the relationship between organization and environment and the life cycle of organization. Several reasons of the fact that rules transformed into red tape are as follows: deviation of rules, irregularity of rules, changes in practice, changes in functional aim, changes in the effects of rules, forcing of rules, growth, and malpractice (Bozeman 1993: 285–286).

Bureaucratic red tape developed as the negative one among the basic qualities of bureaucracy theorized by Max Weber. The desire to continuously increase the strengths of the bureaucracies, their control areas, and their influence levels against politics can be considered among the reasons for the emergence of this quality. Each unit of the bureaucratic mechanisms based on the division of labo began to form separate units of dominance over time. Units that want to increase their effectiveness and importance have had the tendency to see and display the most important jobs within their own scope. Significant expanse of particularly public bureaucracies before the period of public administration reforms took place among the reasons of reform. The number of civil servants increased and procedures of the works also increased. In other words, bureaucratic red tape took bureaucracy into a cocoon. It can be said that the concern of creating a rational and productive organization model, which was one of the reasons of the creation of bureaucracy, was overshaded by red tape. The increase of bureaucratic red tape especially after 1980s was one of the main reasons of the reforms carried out in the field of public administration. With the improvements in technology and increasing use of e-government applications as well as reform efforts, bureaucratic red tape has become controllable.

## Conclusion

Piling documents and prolonged and delayed work are described as red tape. Although the bureaucracy as a model of administration and organization is based on principles such as efficiency and rationality, as modern bureaucracies grows, the red tape thrives. This, naturally, led to the questioning of the basic features of the bureaucracy. Bureaucratic red tape becomes of the main subjects of public reform as indicated by theorists and authors like Al Gore. These questionings and efforts have positively contributed to reducing bureaucratic red tape. With the improvements in technology and increasing use of e-government applications as well as standardization of public services, red tape may be no longer a problem in near future.

# Bureaucratic Red Tape in the Philippines

Arneil G. Gabriel
Department of Public Administration, Nueva Ecija University of Science and Technology, Cabanatuan City, Nueva Ecija, Philippines

## Synonyms

Accountability; Bureaucracy; Good local governance; Positive measure against graft and corruption; Transparency

## Definition

The Anti-Red Tape Act of 2007: Is a law passed by the Philippine Congress which articulates the government's call to improve efficiency in the delivery of public services by reducing bureaucratic red tape, preventing graft and corruption, and providing penalties therefor.

Red Tape: as it is contextualized in the Philippine bureaucracy, refers to paper works, unnecessary bureaucratic documents, requirements, forms, and procedural obsession in the delivery of public service. In recent history, the term "red tape" denotes a ribbon used to bind voluminous documents produced by retired American Civil Veterans as a prerequisite for their retirement claims.

## Introduction

Transparency and accountability are essential to the operation of governments regardless of the type of regimes and territorial boundaries of states (Gabriel 2017). They are seen as complements of policy effectiveness such as when citizens collectively act against power holders who support bad policies or when they commit inaction despite the presence of urgency to commit action (Gabriel and Gutierrez 2017).

Transparency is a tool to increase government accountability to the people, at least in a democratic setup. It is the "sunlight that disinfects the dark corridors of power" from inefficiency and corrupt practices. When actual adherence is observed, they benefit citizens. Both transparency and accountability serve as cleansing mechanisms to check and exert pressure on the bureaucracy to respond to public demands with ease and quality. Transparency and accountability are the governance principles behind the passage of Republic Act 9485 or Anti-Red Tape Act (ARTA) of 2007. The primordial objective of the Act is to prevent corruption and introduce reforms in the Philippine bureaucracy. Alongside with decentralization is the effort of the government to bring efficiency in the countryside. The study assesses the implementation and formulation of the Anti-Red Tape Act of 2007 in ten municipalities of the province of Nueva Ecija, Philippines. It delves into the status of implementation and analyzes its effects on the perspectives of citizen-consumers.

## The Image of Philippine Bureaucracy

The image of Philippine bureaucracy is negatively perceived. The well-entrenched graft and corrupt practices undermine not only the effectiveness of the state but also cause wide spread poverty (Bernas 1996). According to the World Bank Report (Quah 2010), there are an estimated 48 billion dollars siphoned from government coffers toward personal pockets of Philippine government officials. And the records cover only the years 1977–1997. A huge amount allocated for development projects and social services for the poor but diverted to the selfish aggrandizement of bureaucrats (Briones and Zosa 1987). Such corrupt practice continuously destroys the integrity of public institutions and, therefore, public trust (Aniga 2014).

Consequently, people in the government are generally and unfairly treated as crooks, slow in the delivery of services, inefficient, and corrupt (Brillantes and Fernandez 2011). Worse, the government as a whole is seen as unresponsive to

public demands. This public perception of government conditioned the citizens to settle for substandard quality of government service (James 2011). Making the situation worst from worse is the inadequate citizen's engagement in public affairs and the inherently complex built-in procedures in the public offices which slow down the processing of transactions in the government. This picture of Philippine bureaucracy prompted the current President Rodrigo R. Duterte to issue Executive Order 286, mandating all departments and agencies of the government to speed up the process and create the Anti-Red Tape Team.

## Reform Initiatives to Prevent Graft and Corruption

There have been numerous attempts to curb corruption in the Philippine bureaucracy. Many laws in the Philippines have been passed in Congress to address the issue of corruption. The 1987 Philippine Constitution, for instance, devoted an entire article to serve as guideline for public officials and employees in the execution of their public functions (Bernas 1996). Meanwhile, Republic Act 6713 also known as the Code of Conduct and Ethical Standards for Public Officials and Employees serve as a codification of the standard of behaviors public personnel should observe in the execution of the duties of their office (Bernas 1996; Aranas 2016).

Numerous commissions, teams, and law enforcement agencies were also created to implement laws against corruption in the Philippines. Department Order No. 38-2016 created the Presidential Commission on Good Government (PCGG) purposely to recover the ill-gotten wealth of former President Ferdinand Marcos. Unfortunately, these attempts bear no substantial results due to: lack of political will on the part of the leader and agency assigned to implement conflicting laws on corruption, judicial inefficiency, low salaries of government employees, weak citizenship, absence of role model, punitive nature of anti-corrupt policies, and lack of reform priorities (Brillantes and Fernandez 2011; Carino and Alfiler 1986; Quah 2010; Reyes 1994).

According to Carino and Alfiler (1986), majority of anti-corruption laws penalize rather than prevent the commission of corrupt acts. They argued that an effective anti-corruption measure must contain both a system of punishing offenders and a built-in mechanism for prevention coupled with public support at the agency level.

## The Anti-Red Tape Act of 2007

The Anti-Red Tape Act of 2007 is both punitive and preventive in nature which solicited citizens' support in terms of feedback and is implemented at the agency level. The philosophy behind the law is to inform citizens of the kind and quality of services they deserve. It is the only anti-corruption legislation based on client's perception of what efficient government should be and of how services should be delivered. It is intended to improve efficiency in the delivery of government services to the public by reducing bureaucratic red tape, preventing graft and corruption and providing penalties therefor.

The primary objective of the act is to promote integrity, accountability, prevent graft and corruption in the bureaucracy, instill transparency, and increase public accountability of government officials. It has three core components: (a) Citizen's Charter (Section 6), (b) Assurance to the citizens of their right and access to frontline services and the details that must be observed by government officials in the execution of their functions (Section 8), and (c) Use of Report Card Survey.

The first core component, the Citizen's Charter (CC) is a benchmark of performance as it serves as a social contract with the citizens regarding the manner and time necessary for a government agency to deliver a particular service. Not only does it promote effective and efficient delivery of services in the government but also promote transparency while imposing upon accountability among public officials in the performance of their duties. According to Carino, the strength of CC is that it informs citizens of the benchmark of

performance so that they may demand for it (Carino and Alfiler 1986). The Act defines Citizens' Charter as:

> an official document, a service standard, or a pledge that communicates in simple terms, information on the services provided by the government to its citizens. It describes the step-by-step procedure for availing of a particular service, and the guaranteed performance level that they may expect for that service. (RA9485)

According to Calina (2015), Citizen's Charter treats citizens as citizen-consumers since it is propagated under the New Public Administration Model. The idea is to replace consumer rights for political and legal rights. The citizens are considered consumers of government services hence should be the ultimate judge on the quality of services provided by the public institutions.

The second core component is its assurance to the citizens of their right and access to frontline services and the details that must be observed by government officials in the execution of their functions (Section 8). It includes the requirements as to the acceptance and denial of a request for government service, the person-in-charge, and the period within which the request must be acted upon including the appropriate explanation why a citizen cannot avail of certain service. And to ensure observance, a complaint desk is designated in every government agency.

The last core component is the use of Report Card Survey to monitor the implementation, formulation, and observance of the requirements and standard of services that the government may deliver to its citizens. The purpose of this is to prevent red tape and obtain feedback on the implementation of the act using the perspective of public clients and service benchmark set by the Philippine Civil Service Commission.

## The Formulation and Implementation of Anti-Red Tape Act in the Philippines

Recent studies on the formulation and implementation of Anti-Red Tape Act of 2007 show different findings. According to Aniga (2014), service delivery of one university has been efficient following its implementation of ARTA. Conversely, Gomez and Mudlong (2017) have observed that implementation of the same brought no significant change on the perception of student-clients of the chosen university in terms of turnaround time to finish transactions. And, exogenous factors other than university personnel's response to the student's particular demands were perceived to contribute to organizational efficiency. Meanwhile, Saguin (2013) has observed significant improvement in the overall performance, along with the line of the delivery of services, of the five cities in Metro Manila because of the ARTA. But, despite faithful compliance, respondent cities showed varying degrees of success in implementation.

The evaluation of De Leon (2016) proved that the formulation and implementation of the provisions of ARTA in the Bureau of Customs and Clark Development Authority, in the province of Pampanga, Philippines, are not fully compliant to the requirements of ARTA. This is in contrary to the result of study of the Makati Business Club (2016) which attributes the dramatic improvement on the delivery of service of ten national government agencies to the ARTA. Such development in turn has improved the country's rating in the negative perceptions index and substantiates the ease of doing business in the country.

Unfortunately, local government units remain behind their national counterparts when it comes to the observance of ARTA. According to Calina (2015), more than 5 years since the passage of the law, local government units still struggle in the implementation of its provisions. Although the Act is a serious attempt of the government to introduce reforms in the bureaucracy, actual practice still depends upon agency's execution and the personnel's skills, capacity, and knowledge of ethical standards. In the end, what matters is actual adherence and not mere observance.

The present study is an add-on to the existing literature on the evaluation and observance of ARTA provisions in the Philippines. It measures the degree of observance of the ten municipalities in the province of Nueva Ecija to the provisions of ARTA. The study was divided into three major parts, namely introduction, research

methodology, and results and discussion. The specific objectives are to: (1) check whether the Local Government Unit (LGUs) comply with the information requirements of Citizen's Charter; (2) determine the LGUs compliance on the requisites for Front Line Services; (3) determine the degree of observance of the municipalities on Report Card Survey; and (4) provide policy recommendations.

## Research Methodology

### The Study Locale

The map of the province of Nueva Ecija is presented in Fig. 1.

The study used a mixture of qualitative-descriptive method of research and quantitative interpretation of the gathered data. The weighted mean and analysis of variance (ANOVA) were used as statistical treatment to determine the significant difference between and among the perception of respondent-municipalities. The study used a set of questionnaires which was conceptualized by the researcher based on the core components of ARTA. The gathered data were validated by unstructured interviews and personal observations and secondary materials mostly, measurement of the level of formulation and implementation of ARTA. Distribution of questionnaires and interviews were conducted for ten working days during the month of January of year 2018. And each unstructured interview lasted for 10 minutes.

### Participants to the Study

The participants in the study are 100 residents of the 10 municipalities in the province of Nueva Ecija, Philippines. Convenience sampling was used to identify the respondents of the study with ten participants coming from each municipality. Sample municipalities were as follows: two first class municipalities, three second class municipalities, three third class municipalities,

and two fourth class municipalities. The socioeconomic profiles of the municipalities are presented in Table 1.

The municipalities were categorized into classes based on the number of registered voters, land area or political territory, income, and population. It can be noted that 100% of the municipalities were still reliant on agricultural productivity as source of income. Nonetheless, there are some municipalities which are not completely dependent on farming and have other sources of income such as industry, small-scale mining, livestock, and fishing. In terms of the number of registered voters, municipality of Talavera has the greatest number with 77,407 voters, whereas municipality of Licab with 16,662 has the fewest number of registered voters. In terms of land area, the largest is the municipality of Laur with 29,588 ha, while municipality of San Isidro is considered the smallest with only 5,649 ha. In terms of barangay or smallest political unit in the Philippines with 100 families or less, municipality of Talavera, with 53 barangays, has the most number of barangays. Comparatively, municipality of San Isidro with only nine barangays has the smallest number of barangays.

Generally, the system of government is republican with check and balance between the executive, legislative, and judicial branches of government. And, they operate under the structure of two-tier administrative system which are the national and local governments (Calina 2015).

## Findings

(a) ***Citizens Charter***

The philosophy behind the formulation and implementation of Citizen's Charter (CC) is for government offices to have benchmark of performance as well as to inform the public of the standards of service that they deserve. For the purpose of transparency and accountability, these standards of public service must be known to the public so they may demand for effective and efficient service when necessary. As shown, the highest degree of compliance with the provisions

of Citizen's Charter is 4.57, verbally described as "always." Essentially, the first class and fourth class municipalities are comparable in terms of observance of ARTA through posting of bulletins or in having social contract with the government for delivery of public service. In general, the cluster of municipalities has varying degrees of compliance and implementation of Citizen's Charter with results ranging from "almost always" to "always." Transparency through posting of the charter imposes upon an obligation to the government offices to act on citizens' request based on set of standards. This is seen as an area of accountability in case the same standard is not rendered. What imposes accountability to govern is the knowledge of the public of the services and the manner they should be delivered. It is the basis for customer's satisfaction under the New Public Management model.

(b) ***Frontline Services***

The list of frontline services and their corresponding standards are reflected on Appendix 2. Based on survey results, the verbal description of overall weighted mean scores of the ten municipalities range from "almost always" to "always." The three clusters of municipalities under study show full compliance with the requirements of frontline services as reflected by verbal description of "always." Municipalities under the second class and fourth class have the greatest degree of observance of access and procedures in the provision of frontline services. A verbal description of "almost always" on the observance and application of Citizens Charter is nonetheless a good indicator of the positive perception of citizens toward public institutions. In general, public institutions are expected to deliver services based on the principle of transparency and accountability.

(c) ***Report Card Survey***

The **Report Card Survey (RCS)** is a set of questionnaire that measures the agency's quality of service, its adherence to the provisions of ARTA, level of implementation of citizen's charter, and client satisfaction based on effectiveness of frontline service providers and conduciveness of the area (Calina 2015). Third class and fourth class municipalities have higher overall weighted mean of 4.24 and 4.26, verbally described as "always" in the observance of RCS. However, there are indications that negative bureaucratic behaviors are committed in the municipalities concerned. The presence of fixers, demands for additional charges, and offering to facilitate a transaction in exchange for money is "sometimes" and "seldom" observed by public clienteles. The weighted mean scores in the three practices ranges from 2.15 to 2.65. These practices, though seldom committed, must have no room in a democratic state. They are isolated cases but provide a bad impression on the effectiveness and efficiency of bureaucratic operation.

## Conclusion

Republic Act 9485 or the Anti-Red Tape Act of 2007 was enacted to improve the efficiency in the delivery of government service to the public by reducing bureaucratic red tape, preventing graft and corruption, and providing penalties thereof.

Along with the enactment of the law, public institutions were instructed to curb fixing by posting Citizen's Charter in conspicuous areas and following the provisions of ARTA.

This entry has provided an overview of Anti-Red Tape Act in the Philippines in relation to other published works and based on the result of study

| *ANOVA* | Sum of squares | df | Mean square | F | Sig. |
|---|---|---|---|---|---|
| Between groups | 3.208 | 3 | 1.069 | 17.995[a] | 0.000 |
| Within groups | 3.804 | 64 | 0.059 | | |
| Total | 7.012 | 67 | | | |

[a]Difference is significant @ 0.01 levels

conducted on the ten municipalities in Nueva Ecija.

The following analysis of variance (ANOVA) (Table 2) shows the difference in the assessment of the different municipalities in the province of Nueva Ecija in terms of their formulation and implementation of the core component provisions of the ARTA of 2007. The table shows that there is a significant difference in their assessment of the ten municipalities in the province of Nueva Ecija as shown by the significance level of less than 0.01.

The Scheffe's test analysis determines exactly the municipalities with differences in their assessment of the implementation of the ARTA 2007. Table 3 shows that there are four clusters of municipalities based on their class. When the assessment of cluster 1 consisting of first-class municipalities' matched with Cluster 2, the mean difference is 0.31529 and the significant level is 0.005. When it is matched with the assessment of Cluster 4, their assessment on Citizens Charter also shows −0.28471 correlations. This means that from the perspectives of participants public clients there are diverse responses to the same questions about the observance of Citizen Charter provisions. Thus there is a need to identify the sources of divergences. The data on table 3 shows the origins of the differences in perceptions of participants.

**Bureaucratic Red Tape in the Philippines, Table 3** Post hoc analysis with the use of Scheffe's test

| Municipalities (Scheffe) | | Mean difference | Sig. |
|---|---|---|---|
| 1 | 2 | 0.31529[a] | 0.005 |
| | 3 | 0.11706 | 0.584 |
| | 4 | −0.28471[a] | 0.013 |
| 2 | 3 | −0.19824 | 0.143 |
| | 4 | −0.60000[a] | 0.000 |
| 3 | 4 | −0.40176[a] | 0.000 |

Legend: [a]The mean difference is significant @ 0.05 levels

The rating of municipality 1 is different from the ratings of cluster municipalities 2 and 4; 2 and 4; and 3 and 4 regarding their ratings for Citizens Charter (Table 4).

The results of ANOVA insofar as frontline services show that there is no significance difference in their assessment of the observance of frontline services.

Thus there is no need to use post hoc analysis to identify the area of difference.

The ANOVA table on Report Card Survey (RCS) is presented below. As the data show, there is no significant difference between and among clusters of municipalities in terms of RCS (Table 5).

The role of accountability and transparency in the operations of government is vital to economic development. These are the principles behind the ARTA of 2007. In the era of decentralization due

# Bureaucratic Reform

Alex Ingrams
Tilburg University, Tilburg, The Netherlands

## Synonyms

Administrative reform; Civil service reform; Organizational change; Public management reform

## Definition

A structured set of institutional changes to processes, values, personnel, and technologies in the public sector. These changes are designed to address perceived weaknesses or dysfunctions in existing systems.

## Introduction

Bureaucratic reform is a planned approach to improving the work of public agencies through reorganization of structures, basic processes, and

tools. It normally, though not necessarily, also involves changing or integrating new organizational values, objectives, and philosophies of government. The study of bureaucratic reform has deep roots in public administration and public policy theory. Classical public administration concerned itself with the problem of how to redesign bureaucracy to work better. Woodrow Wilson (1887) argued that, while administrative tools had been used to justify overreaches of government authority in history, the same tools could be reappropriated for prodemocratic reforms in new contexts. For Wilson, while a particular task of government intervention could always consider the adoption of new materials, personnel, or beneficiaries, what mattered for bureaucratic reform was not just a single program or project but rather a complete change to the way the bureaucracy functioned. This change required coordinating thinking about inputs, processes, and outputs. The history of these changes in the theory and practice of bureaucratic reform are discussed below. The types and settings of bureaucratic reform are discussed, and key works of literature on the antecedents of reform and its effects are summarized, and their main implications set out for public administration scholarship.

## Classical Theory of Bureaucratic Reform

In their conceptualization of bureaucratic reform, public administration reformers, such as Wilson, and contemporaries like Frank Goodnow and Frederick Cleveland went further than advocating simply the rational management of public resources. They saw the professionalization of bureaucracy as the surest foot forward in a democracy; away from a spoils system toward a fairer and more efficient form of distribution (Lynn 2001). Additionally, they envisaged reform in terms of two spheres: *political* and *administrative*. In the early part of the twentieth century, bureaucratic reform consolidated the view that politics and administration are not, and should not be, separate spheres. Bureaucrats are policymakers tasked with deciding important matters on the front line of service delivery.

According to Lynn (2001), later shifts in bureaucratic theory gradually began to view the role of citizens and diverse kinds of interest groups as key actors in policy development. These formulations were essential to many key texts in the classical period of public administration such as *Frontiers of Public Administration* (Gaus et al. 1936) and *Public Administration and the Public Interest* (Herring 1936). Following the Second World War, scholars of public administration began to question earlier work on bureaucracy and to argue that bureaucracy must undergo a new process of reform because it had previously been dominated by axiomatic thinking and unscientific approaches. Thus, began what Lynn has called the creation of the "myth of the bureaucratic paradigm." Thereafter, following the spirit of the work of thinkers such as Herbert Simon and Robert Dahl, intellectual thought on traditional public administration tended to attribute nonscientific approaches to a so-called bureaucratic age of the early twentieth century. Another formative text of the postwar years, Dwight Waldo's *The Administrative State* (1948), characterized traditional administrative approaches as aimless, unwieldy, and uninteresting. The effect of these formative texts on the theory of bureaucratic reform was both to galvanize theory and practice around scientific principles of observation and measurement, as well as to diversify experimentation in different types of reform.

## New Types of Bureaucratic Reform

At the end of the twentieth century, a new reform movement took place. It was global in its reach, and it emphasized reform in terms of managerial autonomy, competition with the private sector, citizen-centered service provision, and performance measurement. This new public management (NPM) movement, often called "reinvention" in the US context, became a dominant force in bureaucratic reform in countries all over the world. Scholars, such as Hood (1991), also argue that NPM has been treated in western administrative traditions as a panacea for an

impossible range of different bureaucratic problems. Others have argued that the NPM movement was far from unified in its approaches and should instead be seen as a disparate collection of reform practices and objectives within an interconnected setting of innovation. In fact, by the beginning of the twenty-first century, bureaucratic reform approaches occupied a broader range of political and societal concerns and had further diversified. Chief among the values of these subsequent twenty-first-century reform approaches have been governance, decentralization, transparency, and social integration. Thus, the NPM approach to bureaucratic reform led to related types of reform such as the new public service and the new public Governance. On the other hand, other scholars caution that, in fact, signs of an eclipse of NPM-type reforms are greatly exaggerated. Rather, while reforms are diversifying, they still tend to bear strong marks of the original managerialism philosophy of NPM.

Scholarship on bureaucratic reform has often adopted the lens of neo-institutional theory originally developed by DiMaggio and Powell (1991) where reform ideas and innovations spread by *mimetic* learning. However, the aforementioned global permutations of reform approaches, as well as the emergence of new governance perspectives, undermine the idea of a global or regional convergence toward one ideal of new public management (NPM). From the long view, two approaches to reform in general can be identified in the twenty-first-century context: firstly, the NPM types of managerial reform and, secondly, the politically and socially oriented reform of the governance tradition. The latter takes a broader, more fundamental approach to the notion of government, its ultimate goals, and its ability to sustain change. According to another typology of reform traditions by Considine and Lewis (2003), different bureaucratic models prevail in different country contexts. Reforms have impacts on frontline staff in three different types of bureaucracy: *procedural*, *market-corporate*, and *network*. These each have different goals, client relationships, and stakeholders. Procedural bureaucracy is a legally driven notion of bureaucracy focused on using replicable tools to accomplish reliable practices. The market-corporate type is goal-driven and underpinned by a philosophy of performance management and efficiency. Finally, network bureaucracy focuses on client-driven delivery of services that incorporate multiple sectors and partners for maximum flexibility of methods. Each of these types may exist in varying degrees today in different governments.

## The Setting of Bureaucratic Reform

While the history of bureaucratic reform can be viewed as a convergence of global types, a series of hegemonic movements, or an emergence of heterogeneous forms, comparative approaches to reform emphasize the interactions of domestic, regional, and international administrative traditions in a historical, social, and cultural setting. The growth of comparative public administration has led to a new awareness today of the variations in types of bureaucratic reform that connect administrative cultures and traditions in the domestic setting with the international setting. Bureaucratic reform consists in decisions regarding accountability relationships at different levels of government. However, the way that such accountability relationships relate to efforts to invent new processes and functions of governments depends on bureaucratic traditions. For example, some countries such as western European *Rechtsstaat* countries have a strongly legal concept of administrative decision-making, which means that reform tends to be more tightly guarded by a system of courts and legal hierarchy (Bach et al. 2017). These countries have assimilated NPM to a lesser degree, certainly less so than countries in the Anglo-Saxon tradition. In global political and economic powers such as China, a country that has a markedly different political culture to other countries such as the NPM pioneers, the United Kingdom, Australia, and the United States, communist ideology has dominated for decades, and yet later bureaucratic reforms led to liberalization of the economy and a more flexible intergovernmental system as a part of its market liberalization strategy.

Such country reform trajectories have by no means been predictable or linear, and they involve complex trade-offs between various domestic and international ideas and processes. Reform shifts undergo a process of cultural screening by administrative traditions consisting of institutional structures as well as cultural ideas about how government and administration should look (Bach et al. 2017). Logics of administrative change are set in place that influence the type of reforms that come later. For example, the initiation, implementation, and effects of reform are shaped by the type of politicization process that is dominant in a country. Each country has a certain form of balance among politicians, bureaucrats, and civil society that creates internal-driven politicization, politician-driven politicization, or society-driven politicization. Other types of trade-off shape bureaucratic reform structures. Rather than political trade-offs, Gingrich (2015) argues that these complex logics concern trade-offs about how costs and benefits are assessed in terms of technical costs, which draw political leaders against service producers. Political costs draw political leaders against citizens, while expectation costs draw service producers against citizens.

## Antecedents and Effects of Bureaucratic Reform

Bureaucratic reform has been viewed in research as an independent variable and a dependent variable. One of the primary views on reform antecedents concerns the role of politics. Adoption and implementation of reforms is a result of political strategies. Thus, one perspective holds that the best interpretation of the causes of a reform such as NPM reforms is the political purpose that the reforms served influential actors in government and society. Another approach to antecedents of bureaucratic reform focuses not on political strategies per se but on the wider concept of leadership in its normative sense as well as its strategic implications. According to Rhodes (2016), traditional public administration reforms consisted of a robust and effective skill set including counseling, stewardship, diplomacy, and political wisdom. Other research has found that a range of leadership skills foster successful bureaucratic reform. Factors such as willingness to adopt reform that depend on connection to local networks, leadership attitude, and receptivity to change appear to be important. Possible reasons for adopting reform also include the pressures toward organizational survival (Wamsley and Zald 1973) and the challenges of saving on costs and constraints or opportunities arising from a change in the resource base of organizations (Hood and Rothstein 2001).

Most studies of the decision by governments to adopt bureaucratic reforms recognize a whole range of antecedents. One formative study by Wright (1994) suggested that there are six factors that led to the NPM reforms of the 1980s onward: (1) budget deficits and cycles of economic depression. (2) the anti-government philosophy of the "new right," (3) economic and political regional integration, (4) public criticism, (5) international management fashions, and (6) information technology trends. The difference of antecedents between one bureaucratic reform and the next also depends on the type of bureaucratic reform in question, but, on the other hand, there are certainly global pressures to bureaucratic structure that are common across all countries. These pressures toward greater efficiency and responsiveness to citizen demand are the product of their interaction with the domestic context of governments. In addition to antecedents, the study of bureaucratic reform has been concerned with the effects of reforms. Again, these findings from empirical research are largely predicated on the type of reform in question. When it comes to NPM, a great degree of divergence exists on whether effects are mainly positive or negative for bureaucratic performance. One claim, regularly leveled against NPM, is that it was conducive to a thinning of administrative institutions and the hollowing of the state and that NPM has served other ideological and political objectives more than the original goal of improved performance. On the more positive side, NPM types of reform may lead to greater transparency and foreign direct

investment in developing countries (Neshkova and Kostadinova 2012).

Overall, however, positive or negative effects are seen to be largely dependent on the *way* the reforms are carried out rather than on the reforms themselves. Reforms may perform better if they use planning and target setting, have a high degree of flexibility in organizational arrangements, and have high levels of focus on user needs (Walker and Boyne 2006). Too regular or too disruptive kinds of reform initiatives may be related to a lack of stability for bureaucratic personnel, which negatively affects the prospects of reform. Reforms lead to normalization patterns in effective organizational attitudes if they are extensive rather than tokenistic in their permeation of governmental structures. Bureaucratic reform may also add to pressures on government as the expectations of citizens for improved performance rises. Uneven effects may occur across the bureaucratic system because of differences in the political complexity of departments and agencies. Agencies that have routine tasks are relatively easy to reform, but evidence suggests that the impact of NPM reforms on agencies that have significant policy responsibility has been minimal.

In sum, there are a wide range of antecedents and effects of bureaucratic reform. Many of these factors are also in tension with each other. Reforms often exhibit structural tensions due to the inevitable integration or creation of elements that have not been previously aligned. Public administration theory gives extensive attention to these tensions and warns that these are likely to appear during reform implementation and to have lasting effects. For example, NPM and traditional administrative values tend to conflict, and values such as frugality, honesty, and resilience cannot be fulfilled simultaneously (Hood 1991). Contemporary reforms tend to be balanced between administrative modernization and civic engagement, and effective reform consists in integrating them. The importance of civic engagement to these contemporary types of bureaucratic reform appears to be rising in the twenty-first century as a result of the spread of the Internet. Some scholars view these changes as an entirely new approach to bureaucratic reform consisting of greater integration among government departments and holistic, citizen-oriented type of service design and implementation (Dunleavy et al. 2006). While the degree of the effects of Internet-based change on government continues to be debated, there is evidence of positive effects such as greater effectiveness, increases in network-like organizational structures, and citizen empowerment (La Porte et al. 2002).

## Conclusion

Theory of bureaucratic reform has a long and rich history. The attractiveness of the idea of reform is evidenced by its recurrent contestation in politics. The organization of government work has serious consequences for many sectors of society, and for that reason designers of reforms emerge regularly in many different country contexts. There are global trends, notably the late twentieth-century trend in NPM, as well as administrative traditions within countries that shape the direction taken by bureaucratic reforms. Research on the antecedents of reforms shows that intentions of public policy leaders may not always reflect the rational idealism of the classical public administration perspective as strategic concerns have a powerful part to play. Research on the effects of reforms reveals that positive impacts on governance are conditional on many factors relating to the context of the reform as well as the types of skills and techniques that are brought to the task. Recently, reform has focused on Internet-based organizational tools. But the unique impacts of these reforms, as well as the other streams of reform that they add to, continue to be subject to discussion.

# Bureaucratic Structure

Jarle Trondal
ARENA – Centre for European Studies, University of Oslo, Oslo, Norway
Department of Political Science, University of Agder, Kristiansand, Norway

## Synonyms

Governance: Actual decision-making processes
Bureaucratic structure: A formalized set of role expectations
Organizational capacity: Availability of relevant organizational units and staff
Organizational specialization: The separation of labor within organizations (horizontally and vertically)
Organizational affiliation: Organizational members' level of involvement in organizations (primary, secondary, and so on)

## Definition

Bureaucratic structure: A codified set of *role expectations* specifying *who* is expected to do *what*, *how*, and *when*.

## Introduction

Governance takes place within and through bureaucratic structures (Bevir 2009). Bureaucratic structure provides the resource basis for governments to govern broadly speaking, and also the cement of modern political order and civilized political life (Fredrickson 2005; Fukuyama 2014; Kristof 2016; March and Olsen 2006). This chapter applies an organizational approach to account for how bureaucratic structure shapes governance (see Egeberg et al. 2016). It is argued that bureaucratic structures *intervene* in governance processes, thereby creating a *systematic*

*bias* that makes some process characteristics and outputs *more likely* than others (Gulick 1937; Simon 1965; March and Olsen 1983). An emphasis on bureaucratic structure presupposes a theory of organizations that assumes that ways of organizing affect how organizations and their members think and act (March and Olsen 1983). Structural factors include bureaucratic structure, demography, culture, and location. In this chapter, however, the role of bureaucratic structure is center to the argument. There are at last two important reasons for this choice. First, some of the most promising research findings have been revealed on this factor. Secondly, contemporary scholarship lacks a comprehensive analysis of how organizational structures affect governance (see also chapters on bureaucracy, bureaucratic politics, bureaucratization, bureaucracy and politicians, bureaucratic professionalism in this Encyclopedia).

"Bureaucratic structure" consists of a formalized set of *role expectations* that specifies *who* is expected to do *what*, *how*, and *when*. In this sense, the bureaucratic structure is a *normative* structure that is analytically disconnected from decision behavior or process (Scott 1981). A particular bureaucratic structure may be expressed in an organization chart. Despite a variety of definitions, this chapter defines "governance" as encompassing the multidimensional set of decision-making processes taking place within and between government institutions.

An organizational theory approach may be useful in at least two respects. First, it may add new knowledge on how different bureaucratic structures shape governance processes. Secondly, it may also add practical value for administrative policy. These dual usages of organization theory reflect the old controversy in public administration between seeing it as a "science" for understanding (e.g., Simon) versus a "craft" for organizational design (e.g., Waldo) (Raadschelders 2011: 154). If we observe significant causal relations between elements of the bureaucratic structure and characteristics of governance, this provides a potentially important design instrument. This is so because the bureaucratic structure is relatively open to deliberate design (Gulick 1937; Meier 2010; Egeberg 2012). Yet, processes of organizational change may also be difficult to understand and control. Arguably, though, the more organization designers are informed about the complexity of structural change, the more realistic their design proposals may be.

The next section discusses theoretically how bureaucratic structure can affect governance. The second section presents some empirical illustrations of how bureaucratic structures make a difference in governance behavior. Being a non-substantive theory, an organizational approach as outlined below has a wide application to both public sector organizations and private sector organizations, covering a wide range of organizational forms, such as networks and non-governmental organizations.

## An Organizational Approach

Several mechanisms connect structure and governance. First, "bounded rationality" means that decision-makers are unable to consider all possible alternatives and their consequences (March and Simon 1958; Simon 1965). They therefore need to simplify the world. Organization structure may provide systematic and predictable selection of problems, solutions, and choice opportunities (March and Olsen 1976; Cohen et al. 2012). Thus, officials in a particular organizational unit are expected to consider only certain alternatives and their consequences, while leaving it to other units to consider other problems and effects. Second, organizational structures are incentive systems in which participants may find it rational to act in accordance with their respective role expectations in order to achieve rewards or avoid punishments (Scott 1981). Third, institutions may be seen as collectivities in which role compliance is deemed appropriate (March and Olsen 1989).

Theorizing the structure–governance relationship entails identifying *generic* dimensions of

structure that might affect decision behavior in systematic and predictable ways. In short, we need to "unpack" organizations to identify such dimensions. If one is interested in how structures matter, one has to unpack on the different dimensions of structure (Egeberg 2012). These structural dimensions may include variables like capacity, horizontal and vertical specialization, primary or secondary affiliation, and tight or loose coupling, among others. Such structural dimensions can significantly affect interaction, loyalty, coordination, and information processing.

First, *capacity* should be taken into account (Mathews 2012). Organizational capacity implies the existence of departments, units, or positions devoted to a particular policy area? The idea is that in an information-rich world systematic interest articulation, problem attention and problem solving are highly dependent upon the degree to which such activities are underpinned by organizational capacity.

Second, we should examine how bureaucratic structure is specialized. H*orizontal specialization* entails how work is divided horizontally within or between organizations. Organizational boundaries help to coordinate activities within units but tend to hamper such activities across units. According to Gulick (1937), horizontal specialization may take place by geography (territory), purpose (sector), function (process), or clientele. For example, territorial specialization tends to focus decision-makers' attention along territorial lines of cooperation and conflict and to create policy consistency within geographical units while fostering variation across such units. Sectoral specialization, on the other hand, evokes sectoral cleavages among decision-makers and fuels policy standardization within a particular policy field across territorial units. Moreover, a functionally specialized structure emphasizes the importance of *how* things are handled rather than for what purpose. Thus, a structure signals what kind of expertise is deemed relevant. *Vertical specialization* entails how tasks are allocated vertically within or between organizations. For example, by hiving off regulatory tasks from a ministry to a semidetached agency, one may gain less political interference into agency decisions and/or more involvement of particularly affected interest or user groups. Vertical specialization also characterizes a system of government which spans two or more geographical levels (Hooghe et al. 2016).

Third, bureaucratic structures involve *primary and secondary* structures. A primary structure is a structure within which a decision-maker is expected to use most of his or her time and energy. While a ministry department constitutes a ministry official's primary affiliation, committees or organized networks represent secondary structures since participation is expected to be part-time. Although secondary structures might affect actual decision behavior, the impact is assumed to be significantly less profound than in primary structures (Egeberg 2012).

Finally, bureaucratic structures may be more or less *loosely coupled*. Loose coupling may lead to more anarchical decision processes and thus more surprising results (March and Olsen 1976). By design, "organized anarchy" may represent a route to discovery or innovation, a way of breaking the bonds of groupthink and building bridges across policy domains. It may also be a counterweight to opportunism and corruption. Key characteristics of such governance processes come close to a general understanding of improvisation: the absence of consistent and shared goals, trial-and-error learning, shifting attention, and fluid participation.

## How Bureaucratic Structure Affects Governance (Processes)

This section presents empirical illustrations of how characteristics of bureaucratic structures intervene in governance processes. Assuming that governance is sequenced in stages, the discussion is presented in two stages – the policy-making stage and the implementation stage.

### Policy-Making

Studies show how *horizontal specialization* affects the distribution of information in national government bureaucracies. Organizational borders, e.g., between different ministries, establish semipermeable walls that shape the informational

basis for "silo-thinking." Similar effects are found within international bureaucracies (Trondal 2011). Interministerial information exchange is positively related to officials' rank and to the existence of interministerial committees (secondary structures). A recent study by Kassim et al. (2013: 188–89) illustrates behavioral consequences of horizontal specialization within a supranational bureaucracy, where coordination is much easier within than across bureaucratic units. Through horizontal specialization certain interests and concerns become routinely underpinned by organizational capacity while others may be ignored: A study of the transfer of the European Commission's pharmaceutical unit from DG Enterprise and Industry to DG Health and Consumers showed that the unit's policy focus changed from being biased toward business interests to becoming more attentive to patient and public health concerns. The unit's external environment also changed from being dominated by industry organizations toward being more populated by patient and consumer groups (Vestlund 2015). The relationship between a public bureaucracy and its client groups may also be transformed through merging or dividing departments or agencies.

To illustrate how *horizontal specialization* affects governance, European Union (EU) institutions provide an exciting test bed. One distinction is whether a bureaucratic structure is arranged according to territory or a nonterritorial principle of specialization, such as sector or function. In the case of the EU, an inherited territorially specialized system is reflected in the way the Council of Ministers is arranged. The Council, mainly a legislative body, reflects the territorial composition of the nation-state system, each member state being represented by an executive politician. Studies show, accordingly, that decision-makers mainly upload national preferences, and that patterns of cooperation and conflict tend to follow territorial (national) lines (Naurin and Wallace 2008). By contrast, the European Commission, the EU's main executive body, is basically structured according to sector and function. Executive politicians at the top (commissioners) are in charge of particular sectoral or functional departments (directorates general), and they have the Commission as their primary organizational affiliation. Studies suggest that commissioners behave significantly different from ministers in the Council: sectoral and supranational concerns are considerably more emphasized (Egeberg 2006). At the administrative level, a departmental structure based on sector or function evokes sectoral or functional identities among Commission officials. This seems to hold not only for the European Commission services but also for other international administrations (Trondal et al. 2010), and indeed for public administration in general (Egeberg 2012).

European Commissioners' supranational, or European, orientation reflects their primary organizational affiliation at the EU level. A recent study shows that the primary organizational affiliation of administrative staff in the European Commission toward the EU level explains their supranational role orientation (Trondal et al. 2018).

### Implementation

One first empirical illustration of the implementation stage relates to how *vertical specialization* and *capacity* affect governance processes. Central government bureaucracies can be specialized vertically into separate institutions at the national level, for example, a ministerial (cabinet-level) department on the one hand and a central (subordinated) agency on the other. So-called "agencification" – i.e., the creation of independent agencies at arm's length from ministerial departments – has been a bureaucratic mega-trend during the New Public Management wave (Christensen and Lægreid 2006; Trondal 2014). Studies show that also in this case, policy choices tend to be shaped by the organizational context in which they are made: In contrast to their colleagues in cabinet-level departments, officials in national agencies exercise their discretion in comparative insulation from ongoing political processes at the cabinet level (Egeberg and Trondal 2009a; Bach 2010; Verhoest et al. 2010). They have relatively little contact with the political leadership of the ministry, with other ministerial departments than their "own" and with

parliament. When they exercise discretion, they attach most importance to expert considerations. Agency personnel are also attentive to the concerns of affected interest and user groups. Less weight is assigned to signals from the political leadership of the ministry. In ministerial departments, by contrast, priority is given to signals from the minister (Egeberg and Trondal 2009a). In general, vertical specialization lessens the potential for political steering and control. Studies indicate, however, that this loss of political direction can be partly compensated for by creating *organizational capacity* in the form of a unit in the ministerial department that duplicates work being done in the agency (Egeberg and Trondal 2009a; Verhoest et al. 2010). However, although political salience and ministerial steering over national agencies are positively associated, this does not seem to annul the relationship between agencification – vertical specialization and agency autonomy (Egeberg and Trondal 2009a).

One second example is how *horizontal specialization* affects policy implementation across levels of governance. The first illustration involves governance across levels in a unitary state. Implementation of central government policies may take place through *sectoral* bodies at the regional or local level that are owned by the central government. This arrangement leads to standardized public services and regulations across territories, but, simultaneously, intersectoral coordination and the need for local adaptation of policies may suffer. Studies indicate that the latter effects may be somewhat remedied by establishing *territorially* integrated government offices at the regional level (cf. the French "prefects"). By setting up Government Offices for the Regions (GORs) in the UK, the reformers aimed at improving coordination between the regional offices of Whitehall departments and to meet the demand for a single point of contact. Research shows that GORs led to greater coordination in the regions and became important mechanisms for developing "holistic governance" within regions (Mawson and Spencer 1997; Rhodes 2000). Regional or local *self*-government strengthens the territorial component further, thus increasing the potential for policy coherence within subnational territories, but, at the same time, increasing policy variation across such units. Federalization is a step even further in this direction (Hooghe et al. 2016).

Rules adopted by international governmental organizations (IGOs) are implemented by member states. Thus, implementation is at the outset *territorially* arranged. The EU inherited this model: EU policies, e.g., legislation, are implemented by the member states themselves through the government – ministry – agency chain of command. This leaves considerable variation in implementation practices across member states (e.g., Treib 2008). EU executive bodies, mainly the Commission and EU agencies, do not possess their own bodies at the national level; however, EU bodies have established direct partnerships with national regulatory authorities in charge of implementation, most commonly through networks of agencies working within the same (*sectoral)* policy area (e.g., Eberlein and Grande 2005; Dehousse 1997; Kelemen 2002). In this way, national agencies become "double-hatted" and parts of *two* administrations: a national one *and* a European one (Egeberg 2006; Egeberg and Trondal 2009b). Although national ministries may still be the strongest institutions with regard to influencing agencies' application of EU law, the European Commission and EU agencies also exercise considerable influence. The latter entails more uniform practicing of EU legislation across member states.

A shift from a territorially arranged structure to sectorally structured implementation rests on two institutional requirements: First, agencification and decoupling (*vertical specialization*) at the national level. This has made parts of the bureaucratic structure of national administration available for recoupling to EU-level bodies. Second, the existence of the Commission and EU agencies embodies organizational *capacity* for controlling implementation practices at the national level and for constituting hubs of transnational agency networks. Finally, studies have documented that such networks (*secondary structures*) tend to enhance national agencies' autonomy and power vis-à-vis their parent ministries (Bach and Ruffing 2013; Danielsen and Yesilkagit 2014; Maggetti 2014).

## Conclusion

Contemporary scholarship lacks a comprehensive analysis of the organizational dimension of governance (processes). Despite vast scholarships available both on governance and organization theory, respectively, these strands of research have been in mutual disregard (e.g., Kettl 2002; Olsen 2010). Illustrative, the most recent handbook on governance lacks an organizational approach (Levi-Faur 2012). This chapter has argued that applying organizational theory to governance may be useful in at least two respects. First, it may add new knowledge on how different bureaucratic structures shape governance. Secondly, it may also add practical value for change. If bureaucratic structure affects governance processes in particular ways – as suggested above – these structures may subsequently be "manipulated" to achieve desired goals. In this way, theoretically informed empirical research may serve as an instrumental device for policy change. This chapter has suggested that governance cannot be adequately explained without including the organizational dimension of it and different ways of organizing. The following organizational variables have been suggested as independent variables: organizational capacity, organizational specialization (horizontal/vertical), organizational affiliation (primary/secondary), and organizational coupling (tight/loose).

## Synonyms

Bribery; Collusion; Extortion

## Definition

Abuse of public power for private gain.

## Introduction

Corruption (i.e., abuse of public power for private gain) is a problematic issue worldwide, but its corrosive effects are particularly prevalent in developing countries. This is true in areas including economic growth (Mauro 1996, 1998), income inequality (Gupta et al. 1998), tax revenues (Ghura 1998), and child mortality rates (Gupta et al. 2000). Policies effective for reducing corruption therefore need to be pursued.

In addressing this, Quah (2007) separates policies implemented in Asia into three categories. First are cases wherein anti-corruption laws have been enacted but no department or body exists to enforce them. Second are when anti-corruption laws have been enacted and there is a department to enforce them, but the bodies are not independent. Third are cases wherein anti-corruption laws have been enacted and an independent administrative body enforces them.

Singapore's Corrupt Practices Investigation Bureau (CPIB) and Hong Kong's Independent Commission Against Corruption (ICAC) are seen as successful examples of administrative bodies specializing in corruption countermeasures. However, developing countries suffering from rampant corruption, and in looking to

emulate and establish similar bodies, require the national resolve to fight corruption and need adequate budgets for such bodies to be run sustainably. That is not necessarily easy in countries with vulnerable governance and low incomes.

Against this backdrop, what options are available as anti-corruption measures, apart from establishment of an independent administrative body? This question is our motivation for writing this article.

We propose it would be effective to reform the way public servants work. We illustrate this using the case in which there are several tax offices in a region, each holding jurisdiction over particular districts.

In normal circumstances, personnel are employees of their respective tax offices and carry out their work there. As an alternative, we propose that enabling personnel specializing in a standardized task (e.g., receiving tax returns, handling matters related to tax audits) to work on their own task in any tax office would be an effective anti-corruption measure. In this situation, once a staff member completes his or her task (e.g., receiving tax returns), a separate staff member carries out his or her different task (e.g., auditing tax returns). Consequently, different tasks are not performed in parallel at a particular tax office.

This reform is aimed at building a system in which different staff members carry out a series of tasks sequentially and is similar to factory mass production lines. In an administrative context, government offices are situated in each region and carry out the same procedures; therefore a trans-district task production line can be created. In this article, we hypothesize a region with widespread corruption. This is to illustrate how using these reforms could reduce the scale of corruption.

Copious and diverse research has previously been carried out on economic theory on corruption. Rose-Ackerman (2007) and Rose-Ackerman and Søreide (2011) are thought to be the most recent and most comprehensive surveys. Basu et al. (1992), Bac (1996a, b), and Carrillo (2000) are among the studies that from a theoretical standpoint support the effectiveness of independent administrative bodies. However, no studies, as in this article, take the viewpoint of arranging responsibility for ordinary tasks in a region composed of multiple jurisdictions.

The following section sets out the model applied herein, while section "Benchmark" analyzes the case in which personnel in charge of a series of tasks are competitively bribed. Section "Task Structure" analyzes the case in which personnel share responsibility for a series of tasks. Finally, section "Conclusion" covers the implications of the results.

## Model

Many people are permanent residents of one particular district. Below, the population of this district is normalized to 1. There is one local government head, $O$, holding administrative jurisdiction for the region inclusive of the district and who manages two personnel, represented as $O_1$ and $O_2$; all three are assumed to be corruptible.

$O_1$ and $O_2$, both being corrupt, take bribes from residents. When a bribe is paid to one, the other also requests a bribe; thus, the district residents are able to obtain the gain $g \in [0, G]$ only by paying bribes to both $O_1$ and $O_2$.

$O_1$ and $O_2$ are assumed to be informed of the distribution of $g$ through their experience working in the region. For simplicity, we assume $g$ follows the uniform distribution on the interval [0, G].

Now, certain residents' willingness to pay bribes is represented as $b$; in cases where $g \geq b$ ($g < b$), those residents will have (not have) an incentive to pay bribes. Because we assume $g$ follows the uniform distribution on [0, G], the proportion of district residents with an incentive to pay bribes (or the rate of certain residents to pay bribes) is shown as $(G - b)/G$.

In the model set out herein, it is assumed the bribery of $O_1$ and $O_2$ will definitely occur as long as the residents have an incentive to pay bribes. However, if the same residents bribe the local government head, $O_1$ and $O_2$ will not be bribed. On this point, we assume an implicitly complicit relationship between personnel of the local government head, in the sense $O_1$ and $O_2$ use portions of the bribes they each receive to bribe $O$.

An administrative procedure has a series of tasks. The focus of analysis herein is to clarify whether instituting those tasks into a system, where separate members of staff carry them out sequentially, is effective in reducing corruption.

As a benchmark, the following section calculates the scale of corruption in the case in which $O_1$ and $O_2$ perform tasks at the same time. Then, in section "Task Structure," this scale is compared with the scale of corruption for the case in which $O_1$ and $O_2$ sequentially carry out a series of tasks.

## Benchmark

We analyze the case in which $O_1$ and $O_2$ are each responsible for a series of tasks. Here, personnel are assigned to each administrative district. Because a complicit relationship exists between assigned personnel and the local government head, personnel $O_j, j = 1,2$ hand over $s$ proportion of bribes to the local government head. The bribes given to $O_j$ are represented by $b_j$, and the payoff made by personnel $O_j$ is represented by:

$$\prod_j = (1 - s)b_j(G - b_1 - b_2)/G, j = 1,2. \quad (1)$$

This defining equation means the proportion of bribers in the entire resident population is determined by the total amount of bribes paid, and each staff member will receive bribes from that proportion of residents. Each staff member will then split the bribes received from residents with the local government head in accordance with the proportion determined in advance.

Using Eq. (1), the best response function of $O_j$ can be obtained as:

$$BR_j(b_i) = (G - b_i)/2, i,j = 1,2; j \neq i \quad (2)$$

Using the best response functions of $O_1$ and $O_2$ together, then, in the Nash equilibrium, the amounts of bribes for $O_1$ and $O_2$ will both be $G/3$.

By using these results, we find the proportion of residents in the district with an incentive to pay a bribe is 1/3, and the bribes paid will total $2G/9$.

## Task Structure

We analyze the case in which $O_1$ and $O_2$ sequentially carry out a series of tasks. Here, rather than personnel being employees of specific districts, each has his or her own task. Given that each district will have a government office at which the same type of procedures is carried out, $O_1$ and $O_2$ are able to perform their tasks across the districts. That is, as shown in Fig. 1, after $O_1$ completes Task 1 in a certain district, $O_1$ then moves to a different district to complete the same task. $O_2$ then comes to the district $O_1$ was in to carry out Task 2. Task 1 and Task 2 form a series of tasks so that sequentially $O_2$, having completed Task 2, will then move to the subsequent district after $O_1$ has completed Task 1. In this way, a trans-district task work process takes place.

Seen in this type of work process is that $O_1$ and $O_2$ are, respectively, assigned to a cross-district task level, wherein they carry out their tasks as part of a multilayered structure. In this structure, the point where each is apportioned part of the task series is the point at which sequential order is created within the tasks. In manufacturing, this is known as turning a series of tasks into a production line.

In this context, $O_1$ is seen as the first mover, while $O_2$ is the second mover. When this is so, the payoffs of leader $O_1$ are the case of $j = 1$ in

**Bureaucratic Structure Hypothesis, Fig. 1** Multilayered task structure

relation to Eq. (1), and the best response function of $O_1$ is:

$$BR_1(b_2) = (G - b_2)/2 \quad (3)$$

Substituting into the payoffs of the second mover $O_2$ (i.e., the case of $j = 2$ in Eq. (1)), we obtain the following:

$$\prod_2^* = b_2(1 - s)(G - b_2)/2G \quad (4)$$

Calculating $b_2$ maximize Eq. (4), we find $b_2^* = G/2$. Substituting this into Eq. (3), we find $(b_1^*, b_2^*) = (G/4, G/2)$ as the Nash equilibrium.

With the total bribery in the Nash equilibrium being $3G/4$, the proportion of all district residents with an incentive to pay a bribe is 1/4, while the bribes paid amount to $3G/16$. A comparison of these results with the benchmark case (i.e., wherein the proportion of all district residents with an incentive to pay a bribe is 1/3, while the bribes paid total $2G/9$) shows that reforms to the task structure could lower bribery incentives and reduce the amounts of bribes paid.

To summarize the results obtained in this section:

**Proposition 1** With a task structure arrangement wherein, providing $O_1$ and $O_2$ work sequentially, the incentive for bribery decreases, as does the scale of corruption.

## Conclusion

This article illustrates it is possible to ameliorate corruption-related problems in regions with rampant corruption through structural reforms of the working practices of personnel. That is, we looked at regional administration split geographically and showed that a structural conversion, from a structure wherein personnel employment is separate within each jurisdiction, to one in which personnel specialized in specific tasks (whether simple or expert) are able to move among jurisdictions for that task, is an effective anti-corruption measure.

The effectiveness of this approach is based on carrying out tasks sequentially rather than simultaneously. Sequential execution of tasks is also possible without moving individual personnel among districts. However, if all personnel were to carry out their tasks only in one specific district, there is still potential for them to collude to receive bribes even if they carry out their tasks sequentially. Therefore, personnel movement costs need to be sufficiently restrained as personnel execute tasks sequentially while also preventing their collusion in pursuit of bribes.

To that end, value can be seen in making the geographical regions around which individual personnel move as compact as possible by adding public offices and increasing staff (including appointment of civilians).

Bureaucratic principles; Bureaucratic structure; Ideal bureaucracy; Legal-rational; Organizational structure; Weberian bureaucracy

## Definition

The ideal bureaucracy is hypothesized by Max Weber to lead to efficiency and effectiveness in organizations. Max Weber proposes the concept of bureaucracy in a context in which he considers rationalization of society as inevitable (Pollitt 2008), causing a growing impersonality in the social relationship, disenchantment of the world. However, a possible downside of this rationality-driven world is the creation of an "iron cage," trapping man in a mundane, routinized environment (Rønningstad 2015, p. 5).

The bureaucratic structure hypothesis is the link between the six main principles of the ideal model to organizational effectiveness and performance. Max Weber believed that proper structuring of an organization with the core principles of bureaucracy, formalization, centralization, and authority or hierarchy would give organization leadership a sense of direction and control.

## Introduction

Wilson (1975) and Samier (2013, p. 901) observe that the term "bureaucracy" means many things to different people. This may lead to what has been termed as "the bureaucracy problem" (Wilson 1975). To Wilson:

> Max Weber, after all, warned us that in capitalist and socialist societies alike, bureaucracy was likely to acquire an "overpowering" power position. Conservatives have always feared bureaucracy, save perhaps the police. Humane socialists have frequently been embarrassed by their inability to reconcile a desire for public control of the economy with the suspicion that a public bureaucracy may be as immune to democratic control as a private one.

Samier (2013, p. 904) provides a very important observation. Max Weber who seems to be one of the most important proponents of bureaucracy seemed also to be one of its greatest critics. According to Samier, Max Weber (1930) saw that the emphasis on legal-rational values and thinking "would create people and organizations that would lose connection with other values such as affect, tradition, and higher-order values, leading to disenchantment, and an iron cage of modernity." Similarly, Serpa and Ferreira (2019, p. 12) argue that bureaucracy, in general, is associated with very negative features of organizations, such as delays in operation, action centered on opaque standards, excessive requests for documentation, or even countless difficulties in meeting users' or customers' requests. Four themes are explored in the remainder of the entry.

## The Bureaucratic Structure

Robertson (2004, p. 46) defines bureaucracy as a way of organizing human institutions to ensure impersonal effectiveness. To achieve this, a hierarchical structure is adopted; this structure has the shape of a pyramid with authority emanating from top to down. Rønningstad (2015, p. 4) asserts strongly that hierarchy and defined structure are assets for bureaucratic organizations, making them coordinated and precise, while minimizing unnecessary use of resources is key to organizational effectiveness.

Stevenson (1986, p. 308) posits that the use of structure has become necessary in recent times as a result of limitations and failings of individuals and not for the subordination and control of

employees. Six characteristics can be understood as structural ideal types facilitating a rational organization with a focus on hierarchy, formalization, rules, structuring, and regular activities (Rønningstad 2015, p. 5).

Furthermore, hierarchical organization and line management are seen as key to solving problems of accountability. The hierarchical structure was adopted to maintain the conceptualization of bureaucrats as subservient agents.

## Theoretical Approach of the Bureaucratic Structure Hypothesis

Grdešić (2016, p. 787) defines bureaucracy as "the class of professional managers" but also "the system of social and political relations in which the main role is played by the bureaucracy," as well as the "type of activity of the bureaucracy itself" (Grdešić 2016, p. 787). Bureaucracy is a self-organizing entity, and thus, bureaucrats who are self-sufficient, secure, and psychologically developed understand that intangible liberty comes before tangible freedom. To feel further liberated, not because there is an inadequacy but because it makes for personal happiness, this bureaucrat would be likely to employ non-corrupt intentions (Imam 2014).

## The Rational Approach

Selznick (1943, p. 50) and Hilbert (1987, p. 70) support the rational approach of Weber to structuring in organizations. Weber's main interest was in the development of rational bureaucratic behavior as a break from the ties of seignorial leadership setup under the feudal system. A Weberian approach more likely treats bureaucracy as a belief in the rationality of organized action than as a macro-entity that empirically displays that rationality for sociology. Legal-rational authority follows formalized rational rules, procedures, and laws as the basis for transforming modern organizations.

Furthermore, it assumes that actual bureaucratic behavior never conforms with the bureaucratic model, not only because the model is an ideal type but also because it is a subjective type. In tune with this assertion, Rønningstad (2015, p. 5) quotes Weber in the following:

> This system based on the rationality of instructions illustrates how the instrument of bureaucracy can be used for good or bad; the bureaucracy is dependent on good instructions to do good work, just like a hammer is dependent on a steady hand not to hurt the thumb. This is not to say that this is the best system for society, but is the best system for getting things done, and it is prevalent because it is the most rational way of organizing. Instead of an organization being ruled by a dominant master, it is ruled by rationality, and the bureaucratic organization is the best vehicle for delivering this rationality. (Weber 1991)

Bureaucracy is the most typical example of legal domination. This can be attributed to the fact that bureaucrats are rational agents, willing, and able to act in their interests (Serpa and Ferreira 2019, p. 14). However, the approach has its limitations. The limitations include (1) exploitative tendencies of bureaucrats because of information asymmetry; (2) multi-principal problem may emerge where bureaucrats ignore voices of reason and listen to self-interested elected officials; (3) the approach assumes actors are responsive without recognizing that bureaucracies are not monolithic and contain a wide range of values; and (4) public bureaucracies can increase the hierarchical structure which may complicate goals (Serpa and Ferreira 2019, p. 14; Stevenson 1986, p. 308).

## The Bureaucratic Hypotheses

Six main hypotheses can be related to bureaucracy. A hypothesis is just an educational guess, which predicts the outcome of a phenomenon or an event. These hypotheses are drawn from six principles spelled out by Weber in his ideal bureaucracy. The motive is that these principles if adhered to by bureaucrats will lead to greater efficiency and effectiveness (Serpa and Ferreira 2019, p. 15). However, these hypotheses are not the Holy Grail. They have underlying deficiencies which are discussed with each hypothesis.

The first hypothesis is that a planned division of labor leads to effectiveness and efficiency. To effect the division of labor, regular tasks are assigned as official duties, the authority to command others is distributed stably and is strictly determined by rules about coercion, and provision is made for the regular and continuous fulfillment of task (Haveman and Klutz 2016, p. 1). The difficulty with this hypothesis arises when a strict division of labor overlooks the ability and creativity of the bureaucrats to innovate. Some bureaucrats can multitask effectively and efficiently which in the end can help reduce cost and enhance the effectiveness and efficiency of the bureaucratic system. However, a division of labor would not allow them to multitask or even overlap their functions in exigencies.

The second hypothesis is a hierarchy of authority in which power and information flow from top to bottom will enhance the efficient operations of an organization. This requires an established system of superordination and subordination. The hierarchy culminates with a single bureaucrat at the top; it is thus a "mono-critical" structure (Haveman and Klutz 2016, p. 1). The hierarchical structure only functions in simple, mechanistic, and closed systems. Systems, which are complex and open, will be ineffective as hierarchical structure fails to take into account the importance of informal organizations within formal organizations. Samier (2013, p. 904) critiques that bureaucracy maintains the class structure.

The third hypothesis is that formalization and documentation are closely linked to the efficiency and effectiveness of the use of organizational resources. The formalization of rules, regulations, and procedures demands bureaucrats to document each work process without using personal discretion in the discharge of their duties. Thus, bureaucrats are therefore required to be functionally upright rather than personally involved in their positions. In effect, the principles of "impersonal of interpersonal" relations must be seen to be operating. Another example could be the hiring and promotion practices of organizations must be explicit without any form of ambiguity. This hypothesis similarly leads to the emphasis on paperwork to the neglect of "pragmatic solutions" and innovation because everything in this bureaucratic structure is rule-bound and does not necessarily lead to effectiveness. As a result, this type of structure is time-consuming, higher costs and more efforts are the major output of the system, of which the product is red-tapism.

The fourth hypothesis is that selection of bureaucrats based on qualification and competency makes the bureaucracy efficient. Task performance is characterized by specialization in training. Performing their jobs competently requires bureaucrats to possess specialized knowledge and skills, which in turn requires specialized training or education, certified by passing special exams. However, the emphasis on qualification based on specific examination downplays talent. Nonetheless, there are many organizations, for instance, Ernst and Young Auditing firm, that employ talents without certification and such people excel in their task performance. Here talent rather than qualification is used in selecting competent employees.

The fifth hypothesis is that job tenure or security of employment will retain institutional memory, which will provide stability in organizational effectiveness. Consequently, bureaucrats use all their time and energy to undertake tasks related to the bureaucracy, and they will be committed to the organization's health and performance due to job security. Haveman and Klutz (2016, p. 1) observed that bureaucrats are expected to devote time to work to protect the public interest while subordinating their interest. The emergence of performance-based contracts and agreements signifies that this hypothesis will not always be fit for ensuring effectiveness and efficiency in an organization either in the public bureaucratic system or in private organizations.

The sixth hypothesis is that management-based centralization of authority brings efficiency and effectiveness. Decision-making emanates from the top management structure to the lower parts of the structure. Management decisions are based on rules and instructions resulting from specialized knowledge in the vertical relationship provided by the bureaucratic structure. However, this stalls innovation and creativity in organizations because lower-level officers have little input

into decisions and policies that affect their task performance. This may lead to inefficiency since coordination is sometimes difficult to undertake in very large organizations. Although there is horizontal decentralization within a bureaucratic structure, the presence of differentiation on functions and departments may slow decision-making in emergencies.

Meier and Compton (2017, p. 1) believe that bureaucracies have developed fewer structures of hierarchy, networks, clear goals, and privatization. Also, bureaucracies play a representative role; however, when they face challenges in material resources, representation of minority interests, and loss of public trust, they become affected. Stevenson (1986, p. 308) agreed that formal structures are created, maintained, and eliminated in the name of the efficient accomplishment of organizational goals. Thus, organizational goals need to be spelled out clearly always.

However, bureaucratic "failures" of efficiency, effectiveness, or responsiveness can also be linked to lack of adequate resources, ambiguous goals, and lack of autonomy to exploit comparative informational advantages (Meier and Compton 2017, p. 4).

## Functions of the Bureaucratic Structure Hypothesis

The bureaucratic hypotheses function in several ways. Firstly, a division of labor ensures that there exists as part of the bureaucracy a human resource focused on specific tasks and is capable of delivering the policy goals and outcomes of the system. The ability to deliver goals makes the system effective and efficient.

Secondly, Labolo (2013, p. 166) asserts that a hierarchical system is needed to get the most out of the flow of power in society which is the ultimate goal. This signifies that goals are set by those in authority at the top, while implementation is done by those below the hierarchy, leading to organizational effectiveness.

Thirdly, formal documentation functions as the memory of the bureaucratic system. This ensures that records and systems for keeping data and information are well developed. This also enhances impersonality, which could lead to social justice. There is also a reduction in corruption because of clear records and procedures.

Fourthly, the selection of bureaucrats based on specialized skills and technical skills brings greater goal attainment and efficiency. This ensures that people who possess certain abilities occupy certain parts of the system, which promotes professionalism as well.

Fifthly, the other function of the bureaucratic hypothesis is that of unparalleled commitment. This is derived from the hypothesis that full-time employment and job security can improve organizational performance. This can be achieved when remuneration and incentives are provided to bureaucrats to make them focus entirely on their tasks.

Sixthly, there is clarity in standard procedures and it limits the use of discretion. The documentation and writing down of rules ensure that effectiveness and efficiency are achieved by decreasing ambiguity and conflict of rules, regulations, and bureaucratic pronouncements.

## Conclusion

Weber (1947) developed six main hypotheses to provide an understanding of how organizations could be structured to ensure the efficient and effective use of resources. As a result, the bureaucratic structure emerges as an ideal model in most organizational forms, especially in the public domain. Although the hypothesis has provided insight into the effectiveness of organizations, it provides little room for how organizations could be creative and innovative in times of rapid change. Consequently, the bureaucratic structure provided by Weber can only be effective and efficient in a stable environment since it is mechanistic in its outlook and implementation, thereby making its application very rigid and rule-bound. However, the hypothesis is deficient because, in highly turbulent times such as the emergence of the COVID-19 pandemic, nations and institutions have failed to adhere to strict bureaucratic

principles by becoming more flexible in the flow of work and reporting systems.

| Service delivery | Process of delivering service to the public/client. |

## Introduction

Provision of essential public services through implementation of government's programs and policies is the core object of public bureaucracy. But whether (and the extent to which) the service production and delivery conforms to ethical standard and guarantees citizens' satisfaction is subject to bureaucratic environment. Public bureaucracy must function well to enable an effective and efficient service delivery system. The effective functioning of government bureaucracies entails available and accessible incentives for the autonomy of the bureaucrats. However, to have a good deal of discretion in decision-making entrusted to bureaucrats, they must have the professional ethics. Literature on bureaucratization and service delivery, particularly the Nigerian bureaucracy, has not done much to seriously conceive bureaucratization as action taken toward increased controls and adherence to rigid procedures in ensuring citizens' satisfaction.

The relationship between bureaucratization and service delivery is one of linearity: the former is the latter's shadow. The bureaucrats' neutrality, autonomy, and impersonality of social relationships enhance citizen-oriented service delivery because they are believed to possess the technical competence to implement policies and programs for which a given regime takes either credit or reprimand. Interestingly, the critical role of bureaucratization in service delivery is crucial for national development. Strong bureaucracies and institutions of a country are the prerequisites for delivery of goods and services (Ibietan and Oni 2013); therefore, bureaucratic structure, procedures, protocols, and sets of regulations must be in place and strictly enforced.

Public service is two pronged: service by "generality" of the people and for the good of majority of the people. By generality we mean affairs of the people are directed directly by the people or through representatives or appointees of the people. The representatives, however, could be drawn from the private circles. But the sweeping question is whose interest is served? There is a gradual shift from the literal conception of public service matter. This underlying assumption has created the public service principle-practice conflict; and the notion of "continuity" and "change" is fading away. The principle of competent neutrality no longer prevails but the will of the person in position of political authority, reversing quality of output. When the principles are susceptible to the whims and caprices of changing government, stability and progress decrease.

Successive Nigeria governments since the 1960s have continually engaged in seemingly unending political fora and constitutional and economic debates including religious punditry in a somewhat national effort to decipher and determine ways and means to control, institute, and entrench effective, efficient, responsive, and accountable public service system in Nigeria. This is premised on the fact that good and responsible government is the product of efficient, responsive, and accountable public management that is not only legitimate and democratic but essentially citizen-focused. The essence of governance is therefore not for its own sake but instituted and constituted by the people and for the service of the people (Offu et al. 2018, p. 3). Nigeria public service is not isolated from pervasive bureaucratic quagmire, public disservice, overriding political impunity, rentierism, cronyism, and incongruent poor gross domestic products inherent in government businesses.

Although the essence of bureaucracy is to manage large organizations to achieve efficiency and become more accountable to the citizens, it had long ago been arguably settled that the bureaucrats work for ministers (politicians) of the day, not in the public interest. Evidence from Nigeria attests to this. In the words of Offu et al. (2018), "Nigeria public service was more of a shadow and pariah public service than a responsive, popular, and professional service and for

many years and under different political regimes – civil and military, public governance in Nigeria was ineffective, unpopular and counterproductive in many respects."

The bureaucratization procedures, rules, and policies guiding the employment of civil servants in Nigeria are entrenched in the public service rules (Revised to January 1, 2000) including methods and bodies responsible for that. Section 2 of Chapter 2 of the public service rules deals with recruitment, specifying, equally, the types of employment, probation, eligibility, and procedure including compensation, insurance, health and safety, training, overtime, and reward for outstanding work. However, the new public service approach as proposed by Denhardt and Denhardt (2000) focused on citizen's service delivery oriented, and interest satisfaction, but have not controlled the "interest sharing" and the internal ethos of the policy implementers through a top-down policy making and service delivery mechanisms. Denhardt and Denhardt (2000) observed that the New Public Management (NPM) has weakened the principle of coherence due to the fragmentation of policy and service delivery "across multiple agencies and multiple interest" in bureaucracy and service providers (Denhardt and Denhardt 2000). The study revealed that the federal character principle introduced in Nigeria public bureaucracy as a merit-based approach in a multicultural setting has intensified the consciousness of ethnic cleavages; it was intended to address despite the fact the 1999 constitution of the Federal Republic of Nigeria recognized the imperative of federal character to Nigeria's administrative system to attain national unity and public service performance (Idike et al. 2019). Factors adduced include mode of appointment, recruitment, transfer, promotion, etc. Hence, the deteriorating bureaucratic professionalism and the dangerous ramifications for citizen-bound service delivery justify the idea of bureaucratization as an important instrument in Nigeria, since "bureaucrats operate in a multi-tasking environment" (Rasul and Rogger 2015).

This entry, therefore, aims at highlighting challenges of bureaucracy in service delivery, specifying and elaborating on ways of strengthening the Nigeria's bureaucratic practice from the standpoint of bureaucratization. The entry also proceeds from the Friedrich and Finer debate whose contributions underpin bureaucratization idea. Next is the making and functioning of Nigerian bureaucracy from 1966 to 1999, followed by reforms and the trend of Nigerian bureaucracy from 1999 to 2018; complementarity of bureaucratic institution and civil democratic governance; bureaucratization: effective service delivery tool in Nigeria; and conclusion.

## Friedrich and Finer Debate

The Friedrich-Finer debate is simply an elevation of politics-administration dichotomy that owes its origins to the Wilson Woodrow's 1887 paper. According to Friedrich, there is a need for one to conduct oneself rationally because a responsible person will give an account of his doings. Finer views the relationship between responsibility and accountability as underlined by obedience of one to another. Partly from empirical standpoint, Friedrich contends that politicians (ministers) cannot supervise every last detail of the work of public servants because it takes a specialist to understand that detail. His emphasis is that the work is "highly technical" that can only be handled effectively by the experts. Global warming is a current example of a matter of highly technical importance of public policy (Jackson 2009). Responding to Friedrich's disapproval of fusion of technical work and supervision, Finer deviated a little to equate his difference with Friedrich one between "a sense of duty" (Friedrich) and the fact of responsibility (Finer). According to Finer, a sense of duty is a matter for profession, one's conscience, or the public interest. However, since each of the three concepts is abstract and ethereal, the voice of the practical person relegates it to the background, and obedience to specific directive superimposes.

The practice, particularly in Nigeria conforms to the position of Finer. However, this practice has

been criticized for some reason. Ijewereme (2018) upholds Friedrich's position, thus:

> The civil service serves as vehicle for continuity of governmental policy. Government comes and goes but the civil servants remain permanent. The civil service is a corrective of party government. This is because the concern of the civil service is for the good of the nation as a whole, irrespective of the political party in power. (Ijewereme 2018, p.2)

Similarly, empirical evidence from Nigeria's civil service, according to a study by Rasul and Rogger (2015), reveal a correlation of increased autonomy and higher productivity of bureaucrats. In the same vein, the study shows that the higher the monitoring, the lower the output by bureaucrats. Importantly, "public-minded agents want to deliver services and do not have to be made accountable via explicit, formalized monitoring and incentive schemes" (Pepinsky et al. 2017). Summarily, supervisors' failure in active management derives from poor targeting of incentives and multitasking problems (Rasul and Rogger 2015). There is strong influence over permanent secretary appointments; influence often exercised through opaque; and undocumented channels. It is instructive that PSs maintain confidence of and stronger relationship with ministerial team since retaining one's job is most importantly determined by such measure of relationship.

## The Making and Functioning of Nigerian Bureaucracy from 1966 to 1999

Gradual deterioration of the Nigerian bureaucracy in terms of service delivery has necessitated a historical review of reforms with a view to proffering a conceptual solution. Comparatively, since independence till date, the country's bureaucracy has performed far less than bureaucracy during colonial era. According to Ajibade and Ibietan (2016, P.9), "civil service in Nigeria functioned more effectively at the time of colonial administration, and it was patterned along the lines of merit." Nigeria gained independence in 1960, and at the end of colonialism, the Nigerian civil service was enmeshed in a commixture of meritocracy and ecological model to the bureaucratic practice (Olowu, Otobo, and Okotoni 1997). In 1960 the Nigerian civil service underwent a role shift from the imperialist interest of maintenance of law and order to facilitating the realization of the developmental aspirations of the country (Ajibade and Ibietan 2016, p.10). From 1960 to 1966, the bureaucrats lived to their expectation in spite of numerous upheavals. According to Idada, the bureaucrats took advantage of national disturbances to do excellent jobs through taking initiatives and formulating and implementing policies (as cited in Ijewereme 2018).

Bureaucracy and its performance mirror political milieu. The vague policy function delineation between executive and bureaucrats and the attendant service delivery challenge can be traced to the political upheavals of the first republic. Ijewereme (2018) associates the crisis period with anarchy in Western region, Tiv riots, the census crisis of 1965, the general strike of 1964, and the military coup of January 15, 1966, as critical to condition and working of civil servants.

One fundamental impact of the above variables was the dominance of bureaucrats in the combined policy making and implementation functions. The emergent all-powerful "bureaucrat-professionals" resulted from the governance incompetence and administrative ignorance of military administrators in the alien governance terrain. The above scenario characterized Gowon administration more than any other regime. Initial reliance of Gowon administration on the public bureaucracy for government decision-making and policy making rather than bureaucrats performing an advisory role to the political executives (Ijewereme 2018) eloquently illustrates the ignominy of military administrator and political (politicized) bureaucrats. Prominence of the bureaucrats in the country's administration increased following the absence of political heads of the ministries – ministers (Ijewereme 2018). Importantly, the influence of bureaucrats did not wane even when political heads were eventually appointed as the civil servants gained

tremendous influence from the loss of political power (Omitola 2012). The extent of excessive involvement of the highest echelon of the civil service such as permanent secretaries in the governance and day-to-day running of Gowon's government resulted in bureaucratic corruption, nepotism, and favoritism with the concomitant negation of effectiveness and efficiency, Weber's ideals of anonymity, neutrality, and impersonality (Azelama and Agbebaku 2003).

The condition of Nigerian bureaucracy and subsequent policy and political actions to reposition it for effective and efficient service delivery have resulted in the complication of the civil service. For instance, in order to purge the institution of entrenched corruption, divided loyalty, and declining productivity that became infamous under Gowon regime, sack of the bad civil servants led to dismissal of the good without fair hearing (Ijewereme 2018). Consequently, Murtala's government constituted a Public Service Review Commission known as the Udoji Commission to look into the problems bedevilling the institution and recommend measures to address them. But, the commission's recommendations faced outright rejection by the bureaucrats (Omitola 2012). Major problem of the commission's recommendations was lack of emphasis on implementation, leading to the problem of staff development and professionalization.

Progressively, in the second republic, changes were introduced into the public service. Ijewereme (2018) observes that the Udoji Review Commission's recommendation on Code of Ethics was adapted in a government Code of Conduct with which a person must comply. The Code of Conduct was meant "to operate in conjunction with the Code of Conduct Bureau and Code of Conduct Tribunal established to regulate behavior of public officials and check abuses in the exercise of state power on the part of public officers" (Omitola 2012, p.81). Eventually, collapse of the second republic usually would mean a reversal to the military norm of obsessed undue interference in civil service. With the introduction of the American Presidential system at the federal, state, and local government levels, one would expect the civil service to run on the principles of presidentialism. Operationally, it conformed to the British parliamentary system, instead, where permanent secretaries were constitutionally ascribed the status of chief executives of ministries and departments (Ijewereme 2018). The civil service commission empowered them to oversee appointment, promotion, discipline, and development of all officers in the ministry on grades 01–06. The permanent secretaries under the anomaly became so influential in the second republic. Normally, under the presidential model, the minister/commissioner is the chief executive of ministries and departments. Ironically, permanent secretaries continued to enjoy the position of chief executives in the era of presidentialism.

The friction between the principle and practice was heightened by the Financial Instruments and Public Administration Law in which the permanent secretaries were recognized and accorded the status of accounting officers of the ministries and departments. Idada (2000) notes that permanent secretaries' unwillingness to recognize ministers/commissioners as the accounting officers resulted in persistent friction between them. This development lingered up to the military coup of 1983 bringing to the podium of power Muhammadu Buhari. The Buhari administration, unimpressed with the persistent condition of the civil service, undertook some reforms believed to engender national consciousness, patriotism, discipline, and public accountability. In that regard, the administration made provisions for the appointment of permanent secretaries from either inside or outside the civil service. Nevertheless, avarice, corrupt practices, indiscipline, and implementation of federal character principle and lack of accountability by both politicians and bureaucrats inherent in the second republic crippled the civil service and the goal of national development (Okunade 1993). Sooner than later the regime fell to an IBB-led coup.

Before the overthrow of his regime in a palace coup d'etat, Buhari had set up the Dotun Phillips Study Team in March 1985 to conduct a general examination of the organization, structure, and manner of civil service operation and make recommendations that would improve efficiency and

effectiveness. Interestingly, the IBB's government adapted the recommendations into the 1988 civil service reform Decree No. 43 of 1988. With a view to ending the persistent conflict in the area of accountability between permanent secretaries and ministers/commissioners, it unambiguously made and recognized ministers/commissioners as the chief executives and accounting officers. The post of permanent secretary was replaced by director general. Thus, the regime and appointment of the chief executive and accounting officer became a watershed in the politicization of the civil service to the extent the director general's retirement and tenure of the government occurred contemporaneously, unless reappointed by an incoming government. Okunade (1993) maintains that the Dotun Phillips reforms were not successful as the lingering problems of Nigerian bureaucracy were not realistically addressed. Scholars view the reform as a liberal package, which offered superficial solutions to fundamental problems of public administration (Ikeanyibe 2015). Okunade further argues that the superficiality of the reform due to its liberal character was a fundamental flaw. There was a fundamental departure from what ought to be. The 1963 constitution as amended by Decree 17 of 1974 on the role of civil servants in a government department stated thus:

> where any minister of the federation has been charged with the responsibility for any department of government, he shall be under the supervision of a permanent secretary, whose office shall be an office in the public service of the federation. (Omitola 2012, p. 128)

In contradistinction, the 1988 civil service reforms abolished the Office of Head of the Civil Service of the Federation, a position otherwise occupied by political appointees, relegating the permanent secretaries to the background (Ikeanyibe 2015; Ijewereme 2018). Thus, the pathology of patronage system zoomed in excessive corruption, inefficiency, instability, and fall of accountability and equity, a resulting in the total destruction of the apparatus of government and mismanagement (Ijewereme 2018).

These shortcomings were identified by Abacha regime, leading to commissioning of the Allison Ayida Civil Service Panel of 1994 to review past public service reforms. Considered very basic in addressing the challenges, the administration intended to achieve the following: depoliticization of the top echelon of the civil service, fiscal accountability and integrity, discipline, eradication of almost institutionalized corruption at all levels and sections of the service, respect for rules of law and regulations, sense of direction, and restoring efficiency and effectiveness. Following the report of the panel, however, the provisions of Decree 43 of 1988 were significantly modified by the Abacha's government. Among the major changes were scrapping of the post of the director general and reintroduction of the post of permanent secretary. The second change was recognition of the permanent secretary as a career officer appointed on the recommendation of the Federal Civil Service Commission. The third change was that the posts of accounting officer and adviser to the minister/commissioner were the reserve of the permanent secretary. The Head of Service was to be notified of any disagreement between the permanent secretary and the minister/commissioner. The position of the political head/chair and chief executive of the ministry was not taken away from the minister and was responsible for general direction and control of the ministry. Reintroduction of the office of the head of service was made. Generally, while the Abacha's reform was comprehensive, truncation of the 1988 civil service reform by reversing it to the British Parliamentary System of government other than the presidential system reinvigorated the needless conflict between the permanent secretary and the minister/commissioner.

From the foregoing, it is clearly observed that Nigerian bureaucracy functions better in a civil democratic system. Similar to the premilitary bureaucracy, "the top bureaucrats between 1979 and 1983 operated in line with civil service ethics and norms of anonymity, neutrality, and impartiality" (Ijewereme 2018, p.6). Keeping with these ideals has potential for civility and serviceability that can lead to a much better expected service outcome.

## Reforms and the Trend of Nigerian Bureaucracy from 1999 to 2018

The relatively enduring civil democratic governance since its return in 1999 would accordingly engender a more efficient and effective bureaucratic performance. More so, as the longest democratic dispensation, the ongoing fourth republic should deliver far better services to the citizenry. This position is not premised on the assumption that public bureaucracies are immune to manipulation and corrupt practices, but that unlike in the military system characterized by command system, unilateralism and arbitrariness, mechanisms for checks and balances, rule of law, normative right of public criticism, and prospect of reelection bid become public tool for ensuring efficiency and effectiveness of citizen-oriented service provision in a democracy. Bureaucracy underpinned by professionalism, neutrality, and anonymity tends to be more responsive and citizens' needs-focused.

On assumption of office, President Olusegun Obasanjo recognized the profundity of the civil service's depravity. He observed that the institution was bereft of competence, professionalism, customer-civil service friendliness, capacity to respond in efficient, and responsive manner to the needs of the society; core value of political neutrality, impartiality, integrity, loyalty, transparency, and accountability; equity where extant rules and established regulations guide official conduct; suitable environment for assured protection of civil servants and security of job; and competitiveness and innovation. This observation informed the following stern remarks by Obasanjo prior to the establishment of SERVICOM in Nigeria: "Public offices are the shopping floor for government business. Regrettably, Nigerians have for too long been short-changed by the quality of public service delivery by which decisions are not made without undue outside influence, and files do not move without being pushed with inducements. Our public offices have for too long been showcases for our combined evils of inefficiency and corruption, whilst being impediments to effective implementation of government policies. Nigerians deserve better. And we will ensure they get what is better." (As cited in Offu et al. 2018, p. 2)

To reposition the public service, the following reform areas featured in a piecemeal approach: "privatization, deregulation, monetization, downsizing, and outsourcing policies in Nigerian civil service. The establishment of anti-corruption bodies like the Economic and Financial Crimes Commission (EFCC), Independent Corrupt Practices Commission (ICPC), and Due Process Unit in the presidency was intended to ensure quality service delivery. In 2007, Steve Oronsaye Committee was commissioned to review and reorganize Ministries, Departments and Agencies (MDAs), as well as composition of personnel of the federal public service. One major recommendation of the committee was that the permanent secretaries and directors would serve for an initial tenure of four years renewable on ground of performance without recourse to age and years of service (Okorie and Onwe 2016). Oweh observes that forceful retirement of hundreds of directors and permanent secretaries who had served in those capacities for more than 8 years was among the recommendations of the committee (as cited in Okorie and Onwe 2016). In the course of downsizing under Obasanjo government, about 35, 700 workers suffered forceful retirement without a transparent, honest and due process (Okorie and Onwe 2016). Ikeanyibe (2015) avers that the program of reorganization and downsizing is not in tandem with the strategy of dealing with the high unemployment rate in the country. "To effect structural changes in the service, the Budget Office was separated from the Federal Ministry of Finance, while the Department of Administration and Supplies was put in charge of awarding contracts, and the Department of Finance and Accounts was in charge of payment of contracts. This governance reform was with the aim of providing room for transparency in the handling of activities of different departments of government. Unfortunately, all the aforementioned reforms since the beginning of the Fourth Republic to date appeared to make little or no meaningful impact on the deepening crises of ethics, accountability, transparency, and inefficiency in governance of Nigerian bureaucracy." (Ijewereme 2018)

When Goodluck Jonathan became president of Nigeria in 2010, he decided to retain Steve Orosaye's committee. However, it was renamed Presidential Committee on the Rationalization and Restructuring of Federal Government Parastatals, Commissions and Agencies, and terms of reference expanded. Its mandate included study and review of previous reports on the restructuring of civil service. It was equally, as a term of reference, to identify where overlap and duplication existed. The committee recommended the following: merger and scrapping of some departments and agencies and reduction of 541 MDAs to 163 through merger of functional overlapping agencies such as civil defense, police, road safety corps, etc. Alarmed by possible "monumental purge of workers and an extended hardship to relatives," the report was not implemented (Okorie and Onwe 2016, p.22). Consequently, Adamu Fika Committee on the review of the reform processes in the Nigerian Public Service was set up. It was to review the consequences of the report of Orosanye Committee. One important recommendation was abolition of the tenure system of for permanent secretaries and directors. It also recommended that the civil service be rid of political interference. However, disagreement later ensued, leading to a splinter group from the Fika's 16-member committee.

From the foregoing, in the Nigerian fourth republic bureaucracy, the permanent secretary-minister friction still persists in spite of the avalanche of reforms. What is comparatively worrisome is the further deteriorating citizens' satisfaction. One method of understanding and interrogating the problem is principal-agent interaction. From our discussion in previous sections, there is no gainsaying excessive politicization of the bureaucratic reforms has been counterproductive because once competent, professionalized, ethic-based, and efficient bureaucrats are currently at the mercy of self-seeking politicians. Appointees owe allegiance to their appointers. The first implication is loss of ideas even with perfect information. More than any time ever, from entry point to exit point, the institution is heavily dictated by the existence of multiple principal interests, avarice, and preferences. Processes of endorsement for permanent secretaries and directors, recruitment, promotion, and transfers undertake a wide and chains of horse-trading, consultation, and allegiance pacts, creating a possibility condition for multiple principals.

B

## Complementarity of Bureaucratic Institution and Civil Democratic Governance

Most literature holds the view that bureaucratic institution and democratic institution are poles apart. Reasons given are simply convincing, though. The core argument of this section is that Nigerian bureaucracy should be more efficient and effective in delivering services to the citizen in the fourth republic on two important grounds: first, bureaucracy, as persuasively argued below, performs much better in a democratic setting. The second reason derives from the first. Consequent upon being the longest republic since the history of the country, higher productivity by bureaucrats than performed in the first, second, and third republics would be expected. But the woeful performance raises a disturbing contradiction and the question of explainable variable. Why has Nigerian bureaucracy underperformed in the fourth republic? What is the way forward?

The fact that bureaucratic institution exists not only to serve the government of the day but essentially to provide satisfactory services to the citizens for whom the democratic government presumably exercise the mandate through periodic elections makes bureaucratic institution neither a good partner to military administration. Besides, no other forms of government bear a closer affinity to bureaucracy than democracy. At one extreme the bureaucrats are accountable to the political head of ministries who functions at the mercy of the government, and at the other extreme, the bureaucrats are considered to be directly responsible to the citizens. If the argument of the first extreme is tenable, the fact that in presidential civil democratic system the government is presumably directly accountable to the citizens suffices that the bureaucrats are somehow accountable to the citizens. Similarly, if the latter

extreme would uphold, the citizens presumably occupy the highest position in decision-making activity.

Upon the above premise, it suffices to conclude that the bureaucrats are accountable to the citizens. This is also true considering the fact that democratic institution operates within set rules. By contrast, "the autocratic nature of the military with little or no regard for the rule of law and respect for procedural rules..." (Okotoni 2001, p.225) cannot make for autonomous, efficient, and effective civil service. Evidence from Nigeria affirms the foregoing submission. Bureaucracy emphasizes rules, procedures, dialogue, consultation, anonymity, neutrality, etc. (Okotoni 2001). Incidentally, democratic institution shares some elements of bureaucratic ideals, which include dialogue, consultation, rules, procedures, etc. The concept of embeddedness provides clearer distinctions, especially in terms of service delivery performance. Pepinsky et al. (2017) employ the concept to denote the social relationship that influence civil servants' actions. Similarly, the higher the irreconcilability of the bureaucracy's ideals and regime type values, the worse for citizens in service provision. Furthermore, the close relationship that democratic institution bears with bureaucratic institution largely guarantees a more efficient and effective service delivery performance.

In a representative democracy, the citizens' voice is heard through their representatives. In Nigeria, the president and national assembly members are the elected representatives of the people. It is instructive to note that rules guiding elections are contained in electoral laws in which case nonconformity is considered undemocratic, so also the established procedures and norms of bureaucratic institution. Historically, civil democratic dispensation in Nigeria with the exception of the fourth republic, Nigerian bureaucracy has performed far much better than in the military era. The reason the fourth republic bureaucratic performance differs from erstwhile bureaucracy under civil democratic periods may be traced to the long period of militarization of the civil service. In the words of Okotoni (2001, p. 225), "A gradual process is required to de-militarise the civil service and embark upon an aggressive acculturation to civil rule." The major problems are politicization of the offices of the permanent secretary and the head of service, corruption, nepotism, and introduction of the federal character principle by the military (Okotoni 2001; Ijewereme, 2018).

## Bureaucratization: Effective Service Delivery Tool in Nigeria

> Any organisation stands and falls on its ability to get the right people into the right jobs at the right time. The Civil Service is no exception. How permanent secretaries and other senior civil servants are recruited and appointed is therefore one of the most important issues in determining the effectiveness of government.

Bureaucracy without bureaucratization can provide an explanation for the underlying problems of inefficiency and ineffectiveness. Therefore, contemplating bureaucratization beyond mere reforms can guarantee goal-focused bureaucracy. The term "bureaucracy" is derived from the words "bureau" and "kratos." While "bureau" denotes the office," kratos" refers to power or rule. In that connection, bureaucracy would mean the rule of the office. More technically, bureaucracy refers to rule operated from a table or an office, which is characterized by written documents. The concept was first developed by a French economist Vincent de Gourney (1712–1759). Bureaucracy was represented in negative connotations and imagery until Weber, a German sociologist, provided its modern understanding. Weber did not use the word to denote derogatorily rule by officials, rather to emphasize a somewhat specific variant of administrative organization. After translation and availability to "English-knowing world" (Nwizu 2002, p.177), bureaucracy has undergone some major modifications in times and settings. The Weberian ideal-type bureaucracy emphasizes rules, procedures, impersonal relation, and a detailed and quite rigid hierarchical relationship. These elements have remained a subject of contention. The validity of monolithic conception of Weberian bureaucracy was interrogated

by critics, hence the variants and alternative conception. Fred Riggs became the foremost critic of Weberian monolithism who is credited with the development of the concepts of prismatic society and of sala model of bureaucracy (Nwizu 2002).

While bureaucracy does not cover political appointees such as ministers and advisers or members of the judiciary (Eme and Onwuka 2010), Gbenga and Ariyo (2006) characterize bureaucracy by the use of professionals and workers, who are subjected to hierarchical supervision and discharge of their duties in an organized manner backed by rules and regulations. Bureaucratization, on the other hand, is a term used to emphasize commitment to written rules, tighter regulations, established procedures, and depersonalization of official roles. It is simply not tilted toward government regulation or centralization, an aspect New Public Management (NPM) also denounces. NPM is averse to bureaucratization. It believes that de-bureaucratization could guarantee a better service delivery to citizens. Invariably, problem of efficiency and effectiveness in service delivery underpins the NPM development and argument. Specifically, NPM emphasizes a departure from traditional bureaucratic paradigm anchored on formal hierarchies and a movement toward a business-like public sector. From the NPM standpoint, Ikeanyibe (2015) does not see reforms in the Nigerian public sector as resulting in de-bureaucratization of the civil service. Paradoxically, the author admitted there was significant decentralization when he stated thus: "...Sequel to this, there was increased decentralization of personnel functions to line ministries and attempt at professionalizing the service by abandoning the practice of pooling officers and deploying them centrally" (Ikeanyibe 2015, p.5). Larbri states that decentralized management, disaggregating, and downsizing of public organizations are elements of NPM derived from managerialism (as cited in Ikeanyibe 2015). Although Ikeanyibe (2015) persuasively argues that the manner decentralization process followed was not in line with NPM leading to its failure, the fact core elements of NPM have been applied showing that it is not a credibly rescue alternative. Bureaucratization ramps up neutral competence and enhances goal attainment – efficient and effective customer satisfaction. Depersonalization of bureaucracy highlights the supreme echelon of authority of office rather than the holder of the office or position to the extent tendency of nepotism and corrupt practices diminishes.

The essence of bureaucracy is provision of essential public services through implementation of governments' programs and policies (Idike et al. 2019). According to Jaakkola and Halinen (2006), delivery of professional services to clients involves dynamic relationships in which professionals interact with their clients to understand the latter's needs with a view to solving their problems. As a complex activity, service delivery entails meeting not only expressed needs but also unexpressed needs of clients, prioritizing needs, allocating resources, and being able to account for what has been done (Gowan, Seymour, Ibarreche, and Lackey 2001). Inferred from this is that service delivery involves meeting and exceeding customers' expectations. Empirically, service provision and delivery evoke a sense of contractual relationships between policy makers, service providers, and the populace. Yayale (2004) maintains that the contractual relationship obliges the government agency to render a satisfactory service to citizens. The relationship mandates the government as state responsibility to provide services of public interest such as security, education, energy, water, healthcare, and other infrastructures or at least provide social services and personal security-enhancing services. In order to achieve an efficient and effective service without personal-public interest collision, and possibly an overriding impetus of the former, stronger institutions rather than personality cult must never be overlooked. There would be a decreased risk of politicization and a system that is more accountable where rigorous merit-based assessment precedes the exercise of ministerial choice and appointed candidates bound by the extant civil service code and value. Bureaucratization can help to provide greater transparency and clearer accountability around the appointments system if the ministerial responsibility to appoint effective departmental leaders, guided by objective assessment under the supervision of the

Civil Service Commission (CSC), is formally stated. Bureaucratization will require the Civil Service Commission to explicitly assure itself that candidates certified appointable would be able to work well with not just an incumbent but also a variety of administrations.

Public service delivery in Nigeria has witnessed declining performance levels since colonial administrative period. Consequently, it has undergone several reforms to reposition the country's bureaucracy for an improved citizens' welfare. None of the policy reforms has been able to change the narrative. Understanding the issues surrounding Nigerian's low bureaucratic performance since independence, its abysmal failure since 1966 up to 1999, and its deteriorating service delivery condition in the post-1999 governance informs the bureaucratization (re-bureaucratization) appeal and justification.

In this entry, we do not conceive of bureaucratization as centralization but as political and institutional commitment to governing rules and established procedures. However, to assume that Nigeria is still in era of bureaucratization similar to the first republic is a mistaken fallacy and misconception. The reality of Nigerian bureaucracy is dominant politicization and unavowed institutionalized corruption. There are extant rules and established bureaucratic procedures, but they simply exist in nominal plane: they can easily be breached with impunity by both politicians and top bureaucrats. The above phenomenon characterizes appointment, recruitment, transfers, and promotion, in the Nigerian public organizations. The rule of nepotism has displaced professionalism, competent neutrality, and anonymity. In the face of all these anomalies and contraptions, attainment of service delivery goal becomes impossible. Thus, it is erroneous to think that bureaucratization is the problem of Nigeria's public service but politicization and centralization of the service. As noted above, evidence from series of reforms in Nigeria indicates that decentralization took place but without intended citizens' satisfaction. Even in a decentralized public service, rules and procedures must apply if compliance and goals are well-intended.

Service delivery procedures and processes have been reviewed with a view to having better performance and productivity in the Nigerian public service. One of the major problems bedevilling public service is the existence of too many policies without political will for implementation. This, in part, has rendered these reforms incapable of achieving "their purpose and intentions" (Ajibade and Ibietan 2016, P.10). More so, Peter (1997) uses the phrase "bureau pathology" to describe the negative administrative behaviors exhibited by professionals and experts in public organization, which hinders attainment of public goals and delivery of quality public service to consumers.

## Conclusion

Effective performance of public services is underpinned by certain core values, which include, integrity, meritocracy, discipline, professionalism, patriotism, impartiality, and secrecy of government information, unless declassifying such information falls within the breadth of the Freedom of Information Act. The philosophical premise derives from studies' finding that "no nation can attain sustainable development for the enhancement of the living standard of the people without a properly organized public service to implement government policies" (Osawe 2015 p. 45). In this democratic age, bureaucracy is widely seen as an inevitable complement to democracy (Olaopa 2018). However, for a good deal of selfless discretion in decision-making and administrative processes, there shall be disciplinary mechanisms for compromised professional ethics. Interestingly, evidence from Nigeria reveals unhealthy practices for effective and efficient bureaucratic performance. The condition and disillusionment outcome explain what Olaopa (2018, p.) presents as "…in a place like Nigeria, the public service as a bureaucracy, is not a complement to democracy but a patently pathetic manifestation of bad governance." There is a structurally jaundiced Nigerian bureaucracy, which has an adverse effect on recruitment/

appointment processes. For instance, a recent study shows that motives many had joining the civil service account for two broad perspectives on the professional ethics: self versus public. Responses from a sample of Nigerian civil servants highlighted income prospect, the prestige, the stable career path, the opportunity to serve Nigeria, job availability, and educational opportunities as reasons for taking a job in the Nigeria's civil service. Inferred from these is that while some are intrinsically motivated, others are extrinsically motivated. Despite Perry and Hondegheim observation that intrinsic motivation of public servants affects overall productivity and Grindle's submission that intrinsic motivation operates as a safeguard against shirking (as cited in Pepinsky et al. 2017), it constituted only one-thirds of the participants (Phiri 2018). In the hope of becoming rich, professionalism was of no value to civil servants who engaged in the cashgate scandal upon joining the civil service (Phiri 2018). The above submission is consistent with Osawe (2015) findings that failure to adhere strictly to the core values was due to adverse environmental factors such as corruption, favoritism, nepotism, constant political interference, and other primordial factors such as geographical, ethnic, cultural, linguistic, and religious affiliations. It should not appear strange that a certain percentage of the one-thirds may encounter reality shock to divert the entry behavior to a dominant self-serving mindset. In the face of the challenges, impact-free reforms, and vulnerability of the Nigerian bureaucracy to excessive politicization and external interference, commitment to, and application of, operating rules, including bureaucratic values such as competent neutrality, depersonalization, anonymity, and professionalism, need not be compromised.

# Bureaucrats as Hybrids

Adeyemi O. Adebayo
University of South Africa,
Pretoria, Gauteng, South Africa

## Synonyms

Civil servants; Functional and structural hybrids; Organizational forms; Policy formulation and execution; Policy formulation and implementation; Public administrators; Public managers; Purchasers and evaluators; Traditional and managerial administrators

## Definition

Bureaucrats spell the working force of any large organization, public or private. However, for the purposes of this entry, bureaucrats entail public-sector employees

Hybrids broadly entail organizations, organizational sectors, organizational actors, processes, and activities that do not neatly fit into established categories of organizations, organizational sectors, organizational actors, activities, and processes.

## Introduction

The term bureaucracy is fluid and appears to mean many things. However, the term has been mostly employed to denote public-sector organizations. In this connection, Farazmand (2017) notes that two distinct viewpoints describe what bureaucracy entail. The first being the Weberian bureaucracy which conveys two things; the first of these relates to an efficient organizational form which rests on merit, formal, and rational systems; the second relates to a comparative methodological lens for studying modern administration and organization. The second perspective on bureaucracy involves any form of large organization or institution that rests on structure, rules and regulations, process, normative values, record, patronage, and merit systems (Farazmand 2017). It appears there is much convergence on this second perspective when compared with the first perspective (see Farazmand 2017: 2–3 for an overview).

In this way, public-sector organizations are usually referred to as bureaucracies. Hence, it follows that the term bureaucrats refer to public-sector employees. These bureaucrats are, traditionally, charged with the role of implementing core public policy, as well as exercising control over policy-making. In this connection, Araya (2018) observes that there are five steps in public-sector policy-making: agenda setting, policy formulation, decision-making, implementation, and policy evaluation. Following this observation, Araya (2018) submits that politicians in performing their role are usually concerned with the first three of these steps, that is, agenda setting, policy formulation, and decision-making. Bureaucrats on the other hand are concerned with the last two steps, policy implementation

and evaluation. In this way, following Araya's (2018) assertion, bureaucrats traditionally only implement decisions made by politicians and evaluate these decisions once implemented. However, following different public-sector reform paradigms, which is a precursor of arguably all current issues in public administration, this theorizing on who does what regarding public-sector policy-making appears to have changed.

While it may be difficult to establish what role politicians play following the reforms, and coupled with different national settings and circumstances, it is clear that bureaucrats in most cases today do not implement policy but manage implementation processes as implementation is usually carried out by both internal and external executive agencies, although more of external (Kickert 2001; Meyer et al. 2014). Additionally, bureaucrats may be involved in monitoring and evaluating processes as these bureaucrats work hand in hand with implementing agencies. Since the policy implementation role of bureaucrats has been transferred to executive agencies, one may conveniently argue that bureaucrats are now involved in policy formulation and agenda setting, which seems to be core political functions under traditional public administration. Since this appears to be the case, the question that arises is what the role of politicians currently is or should be following the present shift in policy-making. It is not clear whether the role of politicians will be to set agenda and/or co-formulate policy with bureaucrats or whether politicians leave this process to bureaucrats; and these politicians limit their involvement to decision-making on whether or not agenda and policy formulated by bureaucrats should be implemented or not implemented. What is clear is that even though the transfer of policy implementation to executive agencies makes it look like bureaucrats have less work to do, however, in practice, this appears not to be the case, as it seems the shift imposes challenges on public managers and public administration. This is because managers may, in addition to performing their role, which as described above is difficult to establish under the tenets of New Public Management [NPM] and New Public Governance [NPG], be performing the tasks of politicians as well while monitoring and evaluating agencies. As such, these circumstances are expected to result in job difficulty for public-sector managers.

The aftermath of this is that bureaucrats are now a form of hybrids. That bureaucrats are only a form of hybrids implies that there are various forms of hybrids. In this respect, hybridity has been used in describing various organizational and sectoral forms. For the purposes of this entry, such hybrids are referred to as structural/substance hybrid forms. Further, for the purposes of this entry, the other form of hybrids, which does not constitute substance forms, is referred to as functional hybrid forms. Research focus has been on structural hybrid forms. Thus, much research has been done on structural/substance hybrids. There has been some sort of neglect by observers and commentators on functional hybrid forms. In this regard, the purpose of this entry is to discuss this functional hybrid form, in the public sector, and situate this functional hybridity in other hybrid debates. To do this, this entry first discusses categories of hybrids and, thereafter, discusses causes and theoretical perspectives on hybrids before a discussion on bureaucrats as hybrids. Before concluding, this entry argues that bureaucrats as hybrids constitute tension and thus discuss some of the tensions and challenges of hybrid bureaucrats.

## Forms of Hybridity

From the definition of hybrids above, it is clear that hybridity itself is a clumsy phenomenon. Hence, hybridity connotes different things in different settings. In this respect, it means that hybridity can take varying forms. Further, in this context, Anheier and Krlev (2016) concur that what hybridity entails is clumsy by asserting that the notion of hybridity emanated toward the late 1960s in a bid to use hybrids to tackle or adapt to new environmental situations. Consequently, in addition to structural/substance hybrids, hybridity has been used in describing various stakeholders, differing organizational goals, and differing organizational activities (Mair et al. 2015; Schmitz and

Glänzel 2016). However, structural hybridity accounts for the most researched hybridity. In this way, for example, when organizations that are for-profit and nonprofit converge, they are said to constitute hybrid organizations. Borys and Jemison (1989) contend hybridity involves organizations formed as a result of merger, joint ventures, license agreements, acquisitions, and supplier arrangements. In the same context, but in a different dimension, Evers (2005) submits that hybridity occurs when there is a separation between service systems and units. In the same spirit, as Borys and Jemison (1989) and Skelcher and Smith (2015), below, Mair et al. (2015) note the presence of hybrids in public, private, and social sectors. In this regard, and in agreement with, Mair et al. (2015), Skelcher and Smith (2015), while theorizing hybridity in the nonprofit and public sectors, concur that hybridity in one sector differs from that of another sector. The types of hybridity described by these authors, with the exception of Evers (2005), are structural/substance hybridity.

Withal, in a comprehensive analysis of what hybridity entails, Schmitz and Glänzel (2016) submit that commentators have discussed hybridity in the light of markets and hierarchies partnerships, partly public and partly private organizations, and combination of social and economic features. The effect of this is that, as with excessive focus on structural/substance hybrids, there are diverse debates on hybridity and these debates extend to different topics and sectors. Following these several insights into what hybridity entails, it becomes important that hybridity should be seen as combination of elements formally and formerly treated as separate, single, and distinct (Anheier and Krlev 2016). To this end, it makes more sense to broadly categorize hybridity as substance/structural and functional hybridity, as theorized above, while noting that there are several types of hybrids under these broad categories.

It appears the major convergence on hybridity is on organizational or sectoral and structural hybridity. That is, hybridity brought about by the combination of organizations and sectors formally and formerly treated as separate, single, and distinct as well as differing ownership models in general (Schmitz and Glänzel 2016). As a result of this extreme focus on organizational and sectoral hybridity, Skelcher and Smith (2015) contend that literature has undertheorized hybridity. One of the reasons for this excess focus on organizational/sectoral hybridity may be connected with the fact that, because of its strong explanatory power on organizational theorizing, there is much convergence on Oliver Williamson's transaction cost economics, where he identified three governance structures, market, hierarchy, and hybrids, which is a combination of the other two structures (Skelcher and Smith 2015). A second reason for this may be because as with products, markets (Kickert 2001), financing, organization structure (Kickert 2001; Schmitz and Glänzel 2016), and regulatory restrictions, ownership is a way, and arguably the main way, in which organizations differ. A final reason may be connected to the fact that other types of hybridity are not substantial forms as organizations and sectors and may, accordingly, be difficult to elaborate (for an overview of some of the other forms of hybridity, see Anheier and Krlev 2016). These other types of hybrids come under the functional hybrid forms. These three reasons, taken individually and together, partly account for why there is excessive focus on structural hybridity. This excessive focus on hybridity in terms of organizational structure and ownership explains why the main research focus on hybrids has been on interorganizational hybridity, which entails more of substance hybrids, and there has been some form of neglect on intraorganizational hybridity, which is more of functional hybrids. As a result, many meaningful insights on hybridity are yet to be discussed.

## Causes and Theoretical Perspectives of Hybridity

That there are different forms of hybridity may well mean that several issues lead to hybridity. In this respect, the cause(s) of hybridity in one sector may be different from that of another sector as regards both inter and intraorganizational hybridity. In essence, the cause(s) of hybridity in the

public sector may be different from that of the private sector as well as the social sector. Most forms of hybridity started in the late 1960s and early 1970s. In this regard, Minkoff (2002) refers to an account of how political protest and advocacy for social rights, following the end of 1960s, led to the development of a hybrid organizational form combining service provision and advocacy. In the same spirit, Anheier and Krlev (2016) note that hybridity emerged in modern travel space in the 1960s as a tool for adapting to changing environment.

Broadly, irrespective of categories or types of hybrids, the quest for power, influence, efficiency, effectiveness, and resources often lead to hybrid organizational forms, activities, and practices. Hence, separate organizations may come together so as to increase efficiency, be more effective, increase the powers of organizations as a whole or organizational actors, as well as to enjoy resource complementarity. Resources here could be financial, technological, and labor. This resource view is that of resource dependence articulated by Pfeffer (1972). The power and influence view is articulated by Emerson's (1962) classic "Power-Dependence Relations," while NPM and NPG speak efficiency and effectiveness, respectively. Along these lines, hybridity is seen as a way of reacting to the challenges posed by organizational environment. As such, hybridity is seen to, in some sense, constitute ways by which capacity, in whatever way, can be built by making recourse to organizational environment. In another seminal argument, Oliver Williamson refers that while hierarchy may be a better means of economizing on transaction costs, which is deemed to be exorbitant when transactions are organized under the market, boundary issues may well mean that in some cases, organizations will best economize on transaction costs when markets and hierarchies combine to become hybrids. While these may partly account for some of the broad issues that lead to hybridity, they as well account for interorganizational causes of hybridity. Thus, this is an incomplete view of issues resulting in hybridity.

In order to picture a complete view of hybridity, issues relating to intraorganizational elements will have to be elaborated. Along these lines, Skelcher and Smith (2015) submit that hybridity occurs as a result of organizational redesign following environmental changes by actors present in a particular organization field and processes within a particular organization. In this respect, Anheier and Krlev (2016) seems to concur with Skelcher and Smith (2015) by noting that organizational forms, practices, and purpose impact hybridity. Following Skelcher and Smith (2015) and Anheier and Krlev (2016), organizational processes, organizational purpose, organizational activities, organizational actors, and organizational practices partly account for some of the reasons for intraorganizational hybridity. Along these lines, intraorganizational hybridity appears to need researchers' attention. While this attention will have to be broad and cover various functional hybrid types in different organizations and sectors, private, public, and social, the focus here, in this entry, is on functional intraorganizational hybridity in the public sector.

Most of the recent issues associated with public administration and/or management are as a result of different public-sector reforms as well as changes in governance mechanisms. In this way, the reforms have led to varying organizational forms labelled as "hybrids" (Skelcher and Smith 2015), so that there is currently a blurry distinction among public, private, and social organizations (Andrews 2017). Thus, both inter and intraorganizational hybridity in the public sector can be said to have been mainly caused by these public-sector reforms (Meyer et al. 2014). While there has been considerate research attention on interorganizational forms (hybrids) brought about by these reforms, a focus on the intraorganizational aspect, in terms of public-sector actors, practices, and processes, promises some useful insights. This entry explores this.

## Bureaucrats as Hybrids

From the above, it was argued that public management reforms led to hybridity in the public arena, and these management reforms have emerged in the form of NPM, networks, and

NPG. Even though these NPM, NPG, and networks have different doctrines and guiding principles, a common theme with the various reform paradigms in the public sector is that civil servants/bureaucrats are seen as public-sector managers rather than civil servants (Meyer et al. 2014). Put differently, the move from public administration to public management and then to public governance and different kinds of networks resulted also in the movement of practices, in which bureaucrats/civil servants in the former are now managers in the latter. Kickert (2001) sees these shifts as a movement from traditionalists to new public managers, working in what Meyer et al. (2014) contend to be a managerial state. The rationale behind the reforms is to ensure that the state is more efficient and effective (Pollit and Bouckaert 2011) so as to deliver better results (outputs and outcomes); as it appears, following arguments by proponents of the reforms, that the traditional public administration is inefficient and ineffective, compared with the private sector and sometimes the social sector, as a result of excessive focus on rules and regulations; hierarchical authority and control; even though this has been empirically argued to be otherwise (Meier and O'Toole 2011). Since the focus of NPM is largely on managerial concerns, the focus here is more of NPM rather than other aspects of public-sector reforms, even though it is clear that there is an overlap in these reforms and one reform cannot be argued to have eroded others (Alford and O'Flynn 2012; Pollit and Bouckaert 2011).

Rather than the traditional public-sector values of professionalism, equity, accountability, public interest, neutrality, impartiality, and identity safeguards, NPM speaks different sets of values: competition, results, performance measurement, and that civil servants/bureaucrats, now managers under the tenets of NPM, should be trusted and given managerial autonomy to manage and make decisions. This in effect points that NPM itself is a broad term that encompasses insights from different, though informing each other, intellectual streams, especially those concerned with management on one side and economics on the other end. Therefore, it is clear that if civil servants/bureaucrats are to focus on efficiency and effectiveness as a way of delivering results, then these civil servants will have to go about achieving these in ways other than the traditional public administrative way. Thus, they become managers of means by which they can achieve results, rather than focusing only on the traditional public-sector means of achieving public-sector goals. In this connection, managers commit more time and attention trying to understand how to manage relationships with agencies outside the public-sector organizational boundaries (Andrews 2017).

One of the effects of these reforms is the separation of policy-making from policy execution, especially when such policy is concerned with service delivery. In this connection, ministerial departments are charged with the responsibility of making policy on one side and that of establishing managerial contract or collaboration with agencies that are to execute policy on the other. In this way, public management/administration as well as service provision is now seen as balancing market principles and state regulations (Evers 2005) since bureaucrats have moved from providers and producers to purchasers and evaluators (Kwak et al. 2009). Hence, public-sector departments are now seen as purchasers with the role of working with and monitoring provider-agencies (Kickert 2001). The reasoning behind this is that when there is separation between policy-making and execution, managerial autonomy increases, and that bureaucrats are able to spend more time on core public-sector assignments. In addition is the reasoning that this leads to a distinction between the tasks of politicians and administrators/managers which is expected to bring about efficiency, effectiveness, and results, but not necessarily equity. Accordingly, as with core public assignments, public administrators/civil servants are now managers of differing forms of organizations, coordinators of scarce resources, and inspectors of varying forms of relationships ranging from arm's length contracts to collaborative partnerships (Alford and O'Flynn 2012). As a result of these additional roles of bureaucrats, these bureaucrats are, therefore, hybrids shuttling between policy formulation and purchasing as well as evaluating in terms of policy evaluation.

## Tensions and Challenges of Hybrid Bureaucrats

Tensions are bound to arise as a result of this movement from bureaucratic to a managerial state. The prime tension seems to be that hybridity constitutes challenges for bureaucrats and the public sector at large in terms of public values. As with changes in public values, these bureaucrats now spend most of their limited time understanding, managing, and monitoring complicated contracts and collaborations with executive agencies. Thus, bureaucrats have limited time to spend on policy-making and other core public-sector assignments. Closely related to this is the tension regarding accountability. The notion of accountability has become blurry as there are presently several dimensions to accountability. Hence, it's a matter of accountability for what and accountability to whom. Further, there are usually problems regarding setting clear goals, what to measure (output, outcomes, results), and the criteria with which to measure performance in terms of whether a particular contract, collaboration, and intervention is actually effective and efficient.

In addition to this is the fact that public administrators are supposed to work hand in hand with politicians in a bid to attaining public-sector goals. This has always been the case. However, following reforms, this appears to have changed as, in most cases, reforms have resulted in the exclusion of bureaucrats from the political scene. The aftermath of this is that most of the major decisions might be taken by politicians and forced on bureaucrats in a top-down approach, when in effect it should be from a bottom-up approach or a more balanced approach. Further, even though bureaucrats are in charge of policy formulation, the fact that policy execution is carried out mostly by external agencies means that this policy formulation is, more often than not, affected by these policy execution agencies, because excess reliance by public managers on delivery agencies means that these agencies will have to be consulted maximally at the policy formulation stage (Brown et al. 2006; Trondal 2017). In this way, it becomes obvious that hybridity impacts how managers set agenda, make decisions, and implement policies. Thus, bureaucrats find themselves spending more time on consultation and monitoring than in executing core public-sector assignments. The reason why this likely constitutes tension, here, is that there is never a balance between the policy formulation job of public managers on one side and policy executing, consulting, contracting, collaborating, and monitoring on the other hand. This tends to affect bureaucratic/public responsiveness negatively. Taken together, these issues constitute major tensions in public administration.

## Conclusion

Bureaucrats as hybrids is a multidimensional research area that encompasses public management reforms, public administration, public management, organizations, organizational structures, and organizational actors, activities, and practices. Thus, it constitutes a rich research area. It is an area that needs further research attention in order to document the effects of both inter and intraorganizational hybridity on the public sector. The arguments behind reasons for hybridity in the public sector are well framed and convincing; however, proponents while constructing the arguments for did not take into account the issues that may likely arise as a result of bureaucrats having to combine core public-sector assignments with monitoring and evaluating role brought about by the reforms.

One cannot argue that this additional role is not necessary. This is because even though managers commit more time and attention trying to understand how to manage relationships with agencies outside the public-sector organizational boundaries (Andrews 2017), it increases managerial talent in the public sector by working with private- and social-sector agencies, as well as ensures that these talents are retained in the public sector; one can conveniently conclude that it makes the work of bureaucrats more difficult as it introduces conflicting goals into the public-sector arena. The reason for this is that traditional public administrative values and NPM, NPG, and networks managerial values speak different ideas and perspectives. Hence, some observers have

argued that in the light of a managerial state, bureaucrats are working on the wrong set of values compared with what civil service is known for (Farazmand 2017).

In addition to the fact that bureaucrats may be experiencing job difficulty and working on wrong sets of values is that public funds are transferred to the private and social sectors while replacing public service and public interests known to be delivered by systems of public administration with managerial bureaucratic means (Farazmand 2017). While agreeing with Farazmand (2017) on the transfer of public funds to the private sector, it is important to also note that, more often than not, the cost of collaboration and of writing contracts with executive agencies adds to the actual costs of service delivery and administration under the traditional systems of public administration to make service delivery and administration seem to cost more under NPM, networks, and NPG managerial state. In this way, in the end, if not properly and carefully articulated and planned, efficiency, effectiveness, and other parameters that make NPM, NPG, and networks attractive may not be achieved. In fact, it is difficult to conclude that NPM and NPG have offered and will offer anything special to public administration.

As with these is that working with private actors may well mean weakening the public sector, where information that are supposed to be treated as confidential are consciously and unconsciously released to the private and social sectors, especially the private sector by engaging them in public matters. It is clear that while the public-sector will as well, in some way, have access to some private information in the course of these dealings, the information that will be available to the public sector may not be as useful as those that will be available to the private-sector actors. Also, because the public sector may not be effective in monitoring these dealings, the private actors are able to have a good end in terms of bargain and benefits in the end.

# Bureaucrats as Specialists

Hatice Altunok
Abant İzzet Baysal University, Bolu, Turkey

## Synonyms

Bureaucratic hegemony; Technocracy; Technocrat

## Definitions

Bureaucrats are appointed public officers with a certain degree of specialized knowledge. During their career progresses, their experience advances. This leads to a mass who administrate called specialist bureaucrats.

## Introduction

As a rational organization model, the bureaucracy has rules for the basic qualifications of the organizational structure as well as employees. Bureaucrats, who are the agents of the bureaucratic mechanism in which the organizational structure is determined according to the hierarchical boundaries, also take place according to their expertise within this structure. The significance of this expertise has many aspects, one of which, it provides a certain degree of privilege to bureaucrats against politics. In this entry, *bureaucrats as specialists* are examined within the framework of expert identity and the significance and outcomes of specialization.

## The Birth of Expert Identity of Bureaucrats

Bureaucrats and specialists are the subjects of the bureaucracy and specialization. The bureaucracy existed in ancient societies, though not in the name of bureaucracy before Max Weber theorized it on the scientific framework. In the ancient societies, the manner of fulfillment, the hierarchy of command, and the rules to be followed for their realization were determined, and these practices laid ground for the origin of modern bureaucracies. It can be said that bureaucratic systems have been established since the need to carry out tasks by getting organized and to fulfill these tasks by separating them into departments emerged. Within these systems, the knowledge and ability to do business came to the forefront and the professionals became specialists according to their work. The structures and functions of organizations have changed and diversified through the Industrial Revolution. The increasing labor

volumes of the organizations, division of the production process into sections, and increase in the information needed have led to the formation of specialist staff. With the institutionalization of the modern working organizations, bureaucrats have become effective as specialists. The most prominent features of the bureaucrats are that they are described as "specialists" in any related field.

The social and economic transformation that began with the Industrial Revolution also reflected in the intellectual history of the nineteenth century. That is, the division of knowledge into disciplines and professionalization; in other words, the creation of institutional structures that continue to produce new information and re-educate the producers of information has left its mark on this process. Behind the idea that new disciplines should be set up, there is a belief in the need to specialize in separate areas. Alongside this belief is the fact that the reality must be rationally separated into different sets of information (Gulbenkian Commission 2003: 16). This separation has affected the higher education institutions. To this end, educational institutions and particularly higher education institutions in Continental Europe have played an important role in gaining specializations. These institutions have been influenced by the impact and dominance of the need for a teaching instrument that produces specialist education and a special examination system that has become one of the indispensable elements of the modern bureaucracy. Capitalist bureaucratization has widened this type of examinations by increasing the demand for staff members, such as technicians and clerk who have received specialized education (Weber 1996: 319–320).

A specialist who takes an office by taking various exams refers to a person who is equipped with knowledge and skills in a specific area or subject. Specialists hold their positions because of their knowledge and skills. As a result of the division of labor, specialists develop themselves in the areas of specialization in line with the characteristics required by their duties. Bureaucrats are members of the bureaucracy who are in senior positions of organizations and have specialized in specific issues. Besides, one of the meanings attached to the concept of the bureaucracy is explained as all public officials. It refers to the whole of public officials in a state. The bureaucrat is usually assumed to be a person sitting at the desk for the benefit of all the citizens and having a lot of work with the documents (Shafritz et al. 2011: 235). A bureaucrat has the characteristics of impartiality, specialized knowledge, and obedience to their superiors. It is mandatory to enforce the rules and the orders from the top executives. Where his ideas differ from their ideas, the bureaucrat must fulfill his duties in accordance with the orders from their seniors. The word bureaucrat evokes qualifications such as having specialization knowledge, yet it has been influenced by the negative meanings of the bureaucracy. In these sense, bureaucrats are defined as lazy, rule-based, harsh, wasteful, and willing to protect power (Mouzelis 2001: 35; Goodsell 2000: 128). Common perceptions such as they have a behavioral model to increase their personal benefits can also be added to these assumptions.

The essence of Max Weber's model of bureaucracy is that the work is divided into specialization. In this model, the most important qualities to hold an office are to know the correct instructions, to be competent in intellectual techniques in interpreting them, to turn these instructions into less general ones, to develop measures against the risks they can bear, and finally to carry them out. The hierarchy of the offices corresponds to the hierarchy of having the same knowledge and techniques at the same time (Poggi 2007: 43). One of the criteria for the appointment of the executive officers of the upper authority, which forms the basis of the system, is the selection of the candidates according to the technical quality level. In the most rational case, this qualification is tested by examinations or assured by a diploma indicating that technical training is available, or both options are applied at the same time. The task is the one, or at least the main work, of the person who undertakes it. This task creates a career (Weber 2005: 46). Since the beginning of the task in the bureaucracy, employees progress by developing their relevant field of specialization through their careers.

The definition of bureaucrats as specialists carries a scope that emphasizes the specialist quality of bureaucrats. The specialization knowledge and skills of bureaucrats first come to mind before many features of them. Thanks to these, bureaucrats become specialists in the field they work in and they gain privilege in comparison to politicians. Key characteristics of specialist bureaucrats are: They have a specialized terminology specific to their field of study. This terminology distinguishes specialist groups from each other as well as distinguishing them from the members of other professions. They have the potential to create pressure against political power. They are dominant in the law and control-related mechanisms that can protect themselves against politics and society. They are influential actors in shaping public policies.

## The Significance and Outcomes of Specialization

The importance of bureaucrats being specialists is due to the constantly increasing role of technical qualifications in bureaucratic institutions. An employee of a political party or union is often required to have the specialized knowledge even through experience rather than a formal training. Weber notes that the tasks for which no technical qualifications are sought in the modern state are merely tasks of the elected officials (Weber 2005: 48). However, it is seen that even today, most of the occupants of these duties come to those positions by technical experience. Therefore, specialized knowledge is required at every level, from the upper level bureaucrats to the civil servants who provide the routine functioning of the bureaucracy. The main source of the superiority of bureaucratic management is that technical knowledge has become indispensable with the development of modern technology and management methods in the production of goods. From this point of view, there is no role of the economic system being organized on capitalist or socialist bases. In fact, the importance of the specialized bureaucracy will increase in socialist regime even if the same level of technical efficiency is reached (Weber 2005: 51).

The specialized knowledge of the bureaucrat has some important consequences. First, this information-based power position forms the main source of political conflict. The special information that bureaucrats possess can be used as a powerful weapon against political power holders. Bureaucrats who use specialized knowledge as a shield become easily able to take shelter behind bureaucratic activities under the "official secrecy" label, even in situations where privacy is not really required. Whether or not the given case really requires privacy is usually not understood by politicians. Bureaucrats who have the power of specialization can decide whether their activities are secretive or not and thus hold the dominance of the managerial system (Mouzelis 2001: 35–36, 49). Along with these, there is also a tendency in the bureaucracy toward specialization, alienation, and narrowing the field of elected politicians.

Bureaucratic specialization forms the basis of bureaucratic power. Political scientist Francis Rourke describes the influence of specialists with five main components (Chandler and Plano 1982: 157). The first of these components, specialists in the field of a problem or subject experience both demand and opportunity for full-time attention, professionalism in public service. The second is the specialization in the subject. The third, if specialists successfully maintain their specialization in each subject, they create a knowledge monopoly in the subject field, which makes them indispensable in any decision involving their subjects. The fourth is increased feeling of confidence in bureaucratic specialists for technical recommendations. The fifth is the increase in the bureaucratic discretionary power of bureaucratic specialists.

The quality of the bureaucrats' specialization is determined by the training criteria when starting their duties. The level of specialization is updated and developed through the trainings to be received during the term of office. The increasing specializations with the diversification of the modern state's fields of activity have also led to increases in the specializations of bureaucrats. The increase

in the fields of specialization has also integrated the quality of the specialists to professionalism. Specialist bureaucrats have a role in the professional staff position of the bureaucracy. Theoretically, specialization has also been an important principle in shaping the bureaucracy. Bureaucracy has been reshaped in forms such as technocracy, meritocracy, and plutocracy as the state's functions and roles evolved. Technocracy, on the other hand, highlights features or dominance of technical bureaucrats, which are purely technically oriented. Meritocracy has adopted the idea that merit principle should be the basis for the appointments. In fact, there are some criteria for coming to the office in the bureaucracy or one should pass some exams. Despite the existence of these criteria, merit principle has been additionally emphasized through meritocracy due to the lack of bureaucratic merit as a result of the influence of politics. The bureaucracy is a medium that forms specialized and also elite groups. This elite understanding has been developed within the scope of wealth through plutocracy. In addition to these perspectives, public preference theory and other views on bureaucrats have been put forward. According to these views, bureaucrats focus on their own benefits rather than the public interest, in order to obtain benefits such as status, rights, and authority. Although different opinions focus on the various characteristics of the bureaucrats, the main point is the idea that this section is an important part of the state administration. What makes their existence compulsory while fulfilling these functions is their specialized knowledge. The rapid influence of technology on organizations through structures and processes that aim international integration increases the need for specialist bureaucrats. For example, international organizations such as the European Union, the World Bank, and the World Monetary Fund create a new field in the national bureaucracies of the countries with which they are in contact. In public policy areas, language is shaped according to this international bureaucracy. For this reason, there is a need for specialist staff who know the legislation and terminology of international organizations. There is also a need for specialized staff in organizations in order to catch up with the pace of technological changes just like international developments. At the same time, the need for staff with knowledge of technology requires that staff with complex operational qualifications should be employed rather than personnel who provide classical public services. For all these reasons, it can be foreseen that the need for specialist bureaucrats will increase more and more.

## Conclusion

Bureaucrats are indispensable actors of public administration. The qualities they possess and the way they are appointed to the public offices are distinguished from those elected. Although often criticized for their potential to be an unbending force against politics, the bureaucracy also provides practical knowledge and guidance to politics. It is the expertise that brings bureaucrats to that position. There should be two points about bureaucrats as specialists; first, their knowledge fortified with experience has a functional role for rational and efficient administration. Second, the nature of this expertise may cause bureaucrats to be focus center against politics. That is to say, the expertise may also be an instrument of a bureaucratic class that holds the monopoly of information and therefore demands privileges.

## Burnout in Nonprofit Organizations

Pamela Ransom
Metropolitan College of New York, New York, NY, USA

### Synonyms

Collapse; Debilitation; Exhaustion; Fatigue

### Definition

Exhaustion or loss of physical or emotional strength or motivation usually as a result of prolonged stress or frustration.

### Introduction

Burnout or what is sometimes called "burnout syndrome" involves various forms of withdrawal which can be either physical, psychological, or emotional from normal activities that were previously enjoyable because of the experience of stress. It is linked to ongoing exposure to tensions related to work. Symptoms include not only a sense of alienation but also increasing levels of disengagement and cynicism, loss of meaning or exhaustion in workers, which increase as a result of the buildup of stress. Although the problem is related, it is slightly differentiated from stress, because it involves not just reduced energy but also a lost sense of ideals and hope.

The term first developed from efforts to define the listless, empty, worn-out feelings identified in those in helping professions and roles. The label was used with reference to the experience of becoming overwhelmed and fatigued because of excessive demands on resources (Freudenberger 1974). Burnout is identified with three key elements including not only emotional exhaustion but also depersonalization and a sense of reduced personal accomplishment. Some burnout models differentiate mixed phases of cynicism, inefficacy, and exhaustion, with suggestions that these often come after a stage of initial idealism and enthusiasm.

### The Problem for Nonprofits

Although burnout has been identified among workers in a wide range of spheres, the phenomenon has important implications for those in the nonprofit field. Early work in the study of burnout first investigated emotional stress in human services workers in the 1970s. This work highlighted the demanding nature of pressures stemming from ongoing, close client-worker relationships, with depersonalization as a common response. More recently, burnout has been cited as a reason many nonprofit workers expect to leave their jobs for other sectors. Tight budgets, resource constraints, and high work expectations of many nonprofit organizations make them particularly vulnerable to challenges of work overload, with implications for increased levels of burnout. Examples are far reaching and linked to a range of situations including the experiences of post-hurricane recovery workers in community-based organizations who have reported feelings of burnout due to the combination of intense demands and sense of powerlessness from blockages to their ability to make change. Burnout has also been found to be high among those in various nonprofit volunteer roles as well as among social workers with lower levels of education who sometimes have elevated feelings of emotional exhaustion.

While the caring responsibilities involved in many nonprofit jobs may cause some of the problem, it is also noteworthy that nonprofit organizations may also benefit from burnout that individuals experience in other fields. This is because the diverse array of positions offered in many nonprofit organizations seems attractive for

those seeking escape. Nonprofits offer a wide range of interesting job opportunities that are not only emotionally appealing but also intellectually challenging. While a relatively large proportion of those in nonprofits feel it is easy to burnout in their jobs, more workers in this sector have also been found to be satisfied with their work compared to those in federal government and for profit careers. Some organizations in the nonprofit world also benefit from part-time workers, who place high value on positions that offer flexible time arrangements and increased work-life balance.

## Causes of Burnout

Six key areas of job person/mismatch linked to causes of burnout include challenges of workload, control, reward, fairness, values, and community (Maslach and Leiter 2005). High workloads are often a problem in the nonprofit sector which bears some relationship to limited organizational resources available to address ambitious organizational missions. These issues are sometimes linked to stressful working hours and demanding shifts. Cases include burnout identified in various groups of workers such as older workers with disabilities, struggling to negotiate night shifts as well as organizational leaders tasked with complex schedules, long work weeks, and/or extensive travel. Barriers to communication or workers experiencing what they perceive of as forms of inequity have difficulties maintaining adequate levels of control, reward, and fairness that help avoid the buildup of stress. Lack of clarity concerning work roles and the accompanying role conflict, as well as challenging work environments and conditions, are other contributing factors. Nonprofit volunteers, experiencing role ambiguity, and lack of voice also experience the problem. High expectations, and organizational isolation as a result of compartmentalization, exacerbate feeling of burnout in some nonprofit fundraising personnel.

For staff in many organizations, burnout comes from dual factors that involve not only job-related issues but also varied external stress-related sources. When job pressures combine with those from home or personal life, tolls on physical and psychological well-being may occur. High levels of work overload or allowing work to intersect with personal time can be contributing factors. Workers at different life stages, particularly women, or those with complex caregiving responsibilities, such as caring for children or aging relatives, experience burnout and stress from juggling sometimes conflicting demands.

Efforts have been made to identify worker types based on assessments of the degree of burnout. Those with low levels of the feelings of emotional exhaustion and depersonalization linked to burnout have been classified as "laissez-faire" managers because they also sometimes have low levels of accomplishment and investment in their jobs (Loo 2004). A second type of worker, termed "well adjusted," has relatively high levels of achievement but low burnout symptoms. The last group classified as "distressed managers" has only moderate job accomplishments but a high degree of feelings of exhaustion and emotional depersonalization linked to the burnout problem.

Other worker classifications related to theories of exchange involve analysis of burnout types based on various causes of worker discomfort with respect to the physical environment or other organizational or individual conditions. This distinguishes those deemed "frenetic" with high levels of overload, dedication, and ambition, from the "worn-out" worker who manifests relative work passivity, low production, and dedication, and "under-challenged" worker who obtains little job satisfaction because of an environment filled with ongoing monotony or boredom (Montero-Marin et al. 2012). While the frenetic worker's burnout is often heavily influenced by issues of organizational structure or injustice on the job, the worn-out worker's burnout is generally tied to lack of recognition and rewards. For the under-challenged worker, burnout stems primarily from the structure of organizational tasks.

Burnout is prevalent for many in nonprofit leadership roles. A variety of sources of stress for executive directors include challenges associated with working with boards. Increased levels of

blaming, complaining, and lack of cooperation with others are burnout manifestations. In some cases, this may be exacerbated by a lack of adequate levels of support. Many in nonprofit leadership roles face pressures from combined demands for sustained funding and staff tensions because salaries are low. Board members also sometimes experience burnout from pressures related to expectations for fundraising. Some individuals lack the balance of skills necessary to tackle responsibilities associated with both risk taking and providing both organizational directions. Leaders who loose capacity for attention to self-care are often more prone to the problem. Leadership burnout may be exacerbated during processes of transition, sometimes even resulting in organizational harm.

Individuals who are more "centered" in their experience of career success engage in specific forms of self-control essential for avoiding burnout. Four key strengths include the ability to use effective communication, achieve life balance, engage in risk taking, and finally maintain work quality. In combination, these contribute to individual well-being in terms of not only a healthy life perspective but also positive interaction with others and appropriate activity level for both work and nonwork roles. Capacity for calm decision-making in situations of stress plays an integral part.

## Burnout Impacts

In nonprofit organizations, burnout leads not only to declining productivity but also progressive disengagement, reduced levels of responsiveness in client service, and sometimes increased absenteeism. Associated health issues may include sleeplessness, poor concentration and capacity for coping, cardiorespiratory symptoms, even stomach problems such as ulcers, or dizziness (Montero-Marin et al. 2012). This may be particularly problematic for some human service organizations dependent on high levels of employee motivation for quality service delivery. There are recognized similarities and differences between burnout and depression, with burnout noted to also be more tightly linked to the work context. Although these have some of the same manifestations in behavior, differences in production of the hormone cortisone are claimed, with higher levels in those experiencing depression and lower levels among those with burnout. There may be potential for cortisone to serve as a biomarker for detection. In worst cases, feelings of burnout result in various forms of harmful actions or behavior, including self-harm such as increased addiction or alcoholism.

The relationship between burnout and the decision of people to leave jobs is complex. For instance, expressed need to change jobs has been identified in some workers in helping fields with high burnout levels. Feelings of emotional fatigue, exhaustion, and high demands due to contractor regulation and accountability often combine to be factors in decisions to leave. Executives experiencing burnout often go through a stage of initial indecision during which they experience a range of negative feelings before finally making decisions for retirement or career change. Burnout has also been linked to the intention to leave jobs in various workers and nonprofit volunteers.

It is important to recognize, however, that a variety of complex factors influence actual job departure. While pay, problems of pay inequities combined with high workload, or poor supervisory relationships are influential, there also tends to be less propensity for those with longer levels of service to leave. Important drawbacks to departure include positive relationships with coworkers or a sense of client embeddedness that comes from attachment to clients and mission over time. Many experience challenges with respect to ease of movement to other available opportunities. Caution is also warranted on a job change driven purely as a path to burnout avoidance, since alternative positions may present some of the same or even a worse set of problems. With respect to job changers, sometimes feelings of depersonalization and emotional exhaustion linked to burnout actually increase slightly and then level off, with little in the way of increased feelings of personal accomplishment, after new job entry.

## Reduction and Prevention

Reducing burnout involves a range of proactive strategies to create positive work cultures. These can be driven by either the organization or individual. Many basic practices of strategic human resources management, sometimes ignored in the nonprofit sector, are useful including careful analysis of performance and productivity, creative strategies for employee training and career development, and fair systems for compensation. The combination of increasing knowledge, engagement, and "voice" that helps employees change perceptions of their circumstances is helpful in combating the burnout problem.

Organizations have been successful using approaches that help individuals face feelings of burnout head on. Implementation of staff surveys increases understanding of the problem by identifying existing burnout levels and sources. Surveys provide a useful platform for nuanced problem identification, only in an atmosphere of openness with respect to analysis and discussion. While surveys lead to discovery of causes, the process should be followed by proactive strategies for change. Primary diagnostic tools such as the "Maslach Burnout Inventory" (MBI) developed by Maslach and Jackson involves the use of a 25-question survey designed to measure four specific burnout manifestations including feelings about client involvement, exhaustion, personal accomplishment, and depersonalization (Maslach and Jackson 1986). Other simple burnout survey tools are available in user-friendly form to facilitate workplace assessment and discussion (Maslach and Leiter 2005).

With respect to the concept of employee engagement and "voice," cognitive behavioral therapy is a recognized approach related to dealing with the burnout problem. This practical, short-term approach helps individuals both understand and address the problem. Workshops focused on the topic of burnout allow each individual present to have designated, uninterrupted time to talk about underlying sources of ongoing stress. These can be part of comprehensive strategies for stress management training. Effective forms of therapy also sometimes involve use of varied forms of digital games.

These strategies can be integrated into employee assistance and workplace wellness programs depending on organizational capacity, interest, and size. Strengthening staff support through regular conflict resolution, communication, or peer support sessions is a cost-effective measure to ease stress experienced by those in demanding jobs. Coaching and mentoring initiatives that are either peer based or involving the use of outside consultants or volunteers are also sometimes useful. Because it is helpful for people to learn to not dwell too long on the past, some are turning to mindfulness coaching as a useful tool. Various forms of burnout programs are also now available and being administered online. Overcoming burnout now presents a range of opportunities for management consultants in the nonprofit field.

The strategies of therapy, workshops, support groups, mentoring, and coaching help not only to engage workers but also move them through a range of steps involved in identification and tackling of causal conditions. It is critical for individuals to learn specific strategies to help them maintain not only a positive attitude but also proper sense of perspective about the many daily problems that tend to occur in workplace situations. Although standards are important, frank discussions about balance are useful since high levels of perfection are challenging to maintain. Sometimes increased control comes from learning to break tasks that seem overwhelming into smaller, more manageable steps. Other activities include a focus on personal goal setting and action planning about strategies for change.

Stress management may involve not only stress monitoring but also behavioral change through practices including various forms of relaxation such as breathing, meditation, yoga, or even simple methods such as allowing workers brief period of relaxing on the job reading. Others have suggested holistic therapies including acupuncture and/or attention to nutrition as useful in burnout reduction. Various types of environmental change even involving changes in music, color, and lighting can be useful in enhancing the organizational mood. Flex time opportunities can help employees better integrate and balance time. Physical activity and vacations, as well as shifts

in responsibility, are prevention strategies. Some nonprofits are offering employees lengthy sabbaticals on top of regular vacation time, as part of a strategy to avoid the problem.

It is important to recognize that enhanced support systems are also critical tools for reduction and prevention. Emotional support comes from both home and workplace sources and relates to the role of supervisors, coworkers, and organizational policies. Home support may have a more significant impact on burnout reduction than workplace emotional sources, but supportive relationships at work, particularly with coworkers, can be essential. Good leadership and supervisory relationships are also useful. Management interventions should also be tailored not just to those with longstanding jobs but also toward those who are relatively new as well as those who have made an internal job change. This is based on the fact noted previously that some burnout symptoms may temporarily elevate in the first few months to a year on a job.

Attention should also be given to two pronged approaches for organizational leaders and directors with respect to both prevention and treatment. Strategies for prevention should be designed to meet individual needs and may include a range of methods involving not only problem diagnoses and assessment but also career development, job redesign, and/or integration of steps such as time-outs, sabbaticals, or rotational assignments. Executive coaching for nonprofit leaders involving one-on-one consultations may increase aspects of job satisfaction with impacts for burnout reduction, including stress reduction, desire to continue on the job, and enhanced sense of personal/professional balance. Career Enhancement Therapy is suggested as another useful approach for treatment that involves both two full-day small group sessions combined with several months of a series of structured half-day hour meetings to help individuals understand and discuss causes, reactions, and feelings.

An addition, another often overlooked aspect of burnout that may be impacting the sustainability of many nonprofits involved in marketing has been defined as feelings of burnout experienced by the general public toward social issues and nonprofit causes, sometimes called "compassion fatigue." This label characterizes a public overwhelmed or exhausted by a myriad of competitive nonprofit communications and appeals. Strategies to overcome this problem include changes in strategies for messaging, marketing, outreach, and approaches to relationship building.

## Conclusion

Burnout is an important problem faced by many individuals in the nonprofit world. It is critical to recognize the increased levels of stress experienced by many nonprofit workers and volunteers that result from a variety of causes including problems of workload, work structure, and challenges in support systems as well as ongoing demands from the world outside of work. These factors have potential to take a toll on outcomes for both the worker and organization. The problem of burnout runs counter to the zeal and enthusiasm essential for successful achievement of organizational mission and goals. Therefore, regular, ongoing attention needs to therefore be paid to the human side of organizations through proactive approaches to address the problem. Fortunately, a range of strategies are available to deal with the challenges posed, which involve a comprehensive focus on both assessment and engagement at the organization and individual level.

School of Public Administration, Florida Atlantic University, Fort Lauderdale, FL, USA

## Synonyms

Continuity of operations planning

## Introduction

Post-hazard event response and recovery depends in no small part on a resilient business community. When employers are disrupted by disaster, whether natural or technological, they may not be able to swiftly and completely recover in the post-hazard event environment. Jobs may be lost, and these losses in turn put a significant damper on the ability of the community to recover effectively. Because business success in recovery is linked to the recovery of communities, and businesses must also consider protection of employees' interests in their work and the legal protection of the company, enterprises may consider business continuity planning (Beaton et al. 2008). Such a pre-event mitigation strategy may provide a level of capability for the business to respond more quickly and effectively to the challenges of a hazard event. While business continuity planning cannot always be totally effective in preparing a firm for crisis, having a plan in place, coupled with the benefit of having worked through that plan and improved the firm's understanding of what it might need to do in time of crisis, can provide tangible benefits to businesses, and in turn to communities.

## Business Continuity

Business continuity may be defined as "an ongoing process to ensure that the necessary steps are taken to identify the impacts of potential losses and maintain viable continuity and recovery strategies and plans" (National Fire Protection Association 2016). Business continuity speaks to a general hope that a business endures, beyond its creators, and into the indeterminate future. Business continuity management (BCM) can be defined as "a management process that identifies risk, threats and vulnerabilities that could impact an entity's continued operations and provides a framework for building organizational resilience and the capability for an effective response" (Disaster Recovery Institute 2016). Continuity planning is strongly connected to resilience (White and O'Hare 2014) of businesses and communities.

The ambition of business continuity itself as a conceptual matter is to allow a business that has been affected adversely by a hazard event or crisis to surmount attendant obstacles and return the business to functional form. The objective of continuity has less to do with returning to pre-event normal, because returning to normal in that respect may not be possible given the changed circumstances of the post-event environment. Rather, continuity suggests that a business, with planning, can restart operations rapidly and then endure as part of the business fabric of a community or industry. The advantages from business continuity are that services and products remain available, employees remain employed, and related businesses and industries are not further

disrupted due to removal of important business partners in their network. Business continuity is also demonstrated by a firm maintaining "the confidence of shareholders, customers, employees, and the public at large" (McKnight and Linnenluecke 2016, p. 293). In effect, attention to business continuity is one important way for businesses to raise their awareness of potential risks that they face, pre-event, and in doing so reduce vulnerabilities, so that they may achieve some level of resilience in facing crises in the future.

While business continuity is a simple concept on its face, the practical reality of continuity is that there is much to consider when addressing risk and planning for the future of a business in changing and even hostile contexts. Beyond natural disasters, risk comes in a variety of forms. Business owners may not be able to imagine that certain risks (such as riots) could confront their businesses at some point. Some believe that government or police will intervene quickly and completely in bringing situations under control, and thus reduce private sector risk (Doern 2016), but it is clear from responses to past disasters (notably Hurricane Katrina in 2005) that governmental intervention to address hazards of all types may be delayed or ineffective. There can be overestimation of a firm's ability to avoid disruption and an assumption made that a firm and its owners will be resilient, no matter what hazard may occur. These can be dangerous assumptions for the future of a business.

Businesses must consider what makes them valuable to the market in the first place and how to best position that understanding in the current operating environment, adjusting that view as needed to changing circumstances and customer demands. Business culture considers the organizational values that make a business unique and may be worth preserving, and this is a consideration for continuity planning as well. Business owners' interests in continuing their operations are weighty for economic, social, and personal reasons. Dedication to core ideology and a belief that the business is worthy and should go on are all important to continuity (Drozdow 1998).

## Business Continuity Planning

The actual planning of business continuity can become quite involved. As an example, the National Fire Protection Association recommends risk assessment and close consideration of how a variety of hazards might affect a business, and how an event might disrupt the business and its normal manner of operation (through a business impact analysis). The idea of continuity goes beyond that to fundamental aspects of operating a business in a sustainable manner. For example, businesses should have clear goals and objectives and ways to track performance. Leaders need to be committed to continuity planning and supporting such a program. Businesses should comply with applicable laws, have a program to identify, and keep vital records in a protected and usable way (e.g., backing important information up to the Internet instead of solely keeping paper files that are easily damaged or destroyed in a hazard event). Business should consider the well-being of staff; documentation of assumptions about how the continuity plan will work if or when it is called upon in a response/recovery effort; how to prevent incidents from happening, to the extent that is possible; and what steps might be taken to respond to incidents (National Fire Protection Association 2016).

The direction that a continuity plan should be exercised periodically is a useful practice and extends to making the plan a living document, rather than an exercise that is completed, shelved, and forgotten. Creating a continuity plan allows for retention of critical organizational knowledge (Layton and Lambe 2011). Having considered possible issues with communication in a hazard before such a concern occurs is a central factor in continuity planning, as is having a strategy to relocate the business to other quarters within a city or region or to operate it differently until the community returns to normal (or a new normal, which is a distinct possibility). Business continuity plans, as living documents, should be periodically revisited and updated so that they remain current and take full advantage of technologies that will allow a firm to be more responsive and recover more quickly (National Fire Protection

Association 2016) (The National Fire Protection Association's self-assessment tool and preparedness guide, which accompany the code for business continuity, are quite detailed and may prove to be a useful resource for business planning purposes. In addition, ISO 22301 and ISO 22313 are international standards that focus on business continuity and worthy of review.).

## Business Continuity Planning and Public Policy

Governmental organizations might find it valuable to consider the perspective of business enterprises in planning for disaster response and recovery. Businesses benefit from "increased access to decision-making, improved business continuity and direct involvement in contingency planning" (Rogers 2013, p. 325); this requires an open door with local government to consider continuity as a partnership that benefits the whole community. Consistent with the advice to exercise continuity planning, drills or simulations can include "loss of key business activities," as well as how business might be impacted by a "breakdown of public order" (Lee et al. 2009, p. 727). Such drills may provide an opportunity for government emergency operations staff, local government staff, and business/industry counterparts to work together to consider how they as partners might respond to a hazard event, with an eye toward quick response and full recovery of the business sector.

Business continuity has increasingly become a focus of emergency response and coordination, as awareness heightens about the precarious circumstances of businesses, and especially small enterprises, in the post-hazard event context, and how disruptions might impact the surrounding community. There is good reason for business continuity planning as a capacity that should be encouraged by governments. For example, after Hurricane Andrew in 1992, among "businesses that received storm damage, 80% of those lacking a business continuity plan failed within 2 years" (Somers 2007, p. 453). From a public policy perspective, the State of Florida includes business continuity in its comprehensive plan for emergency management, under emergency support function 18 (ESF 18), governing "business, industry, and economic stabilization." The plan suggests that "businesses that prepare are more likely to return to the community after a disaster. Preparedness campaigns developed for the private sector aid in business continuity planning and information sharing to employees on personal preparedness." In terms of implementation, the plan directs those working with ESF 18 to "provide business continuity information and preparedness information for the business community to share with employees, stakeholders, and customers." (Florida Division of Emergency Management & State Emergency Response Team 2016, p. XVIII–3).

Small enterprises often do not assess risks from hazards and consider possible impacts or draft and implement continuity plans. As a result, recovery becomes more arduous. What may have been manageable concerns with supply chain disruptions, for example, becomes insurmountable without continuity planning. It is important to note that "institutional capacities in natural-disaster resilience and business continuity are strong determinants of long-term competitiveness," and for that reason, businesses "need to invest more in the long-term continuity of the supply chain and implement risk-management measures" (Abe and Ye 2013, p. 580). Given this importance of planning to smaller enterprises, it is troubling that academic research in this area is a relatively recent development (Herbane 2010).

## Conclusion

Time spent in pursuing effective plans for business continuity is well spent, as "improved firm-level resilience positively influences community resilience when it enhances the community-level capacities associated with the community's capital" (McKnight and Linnenluecke 2016, p. 300). A concern with the implementation of continuity

concepts in the business sector is that the "rhetoric of continuity" might usurp attaining the idea of continuity in practice and prevent continuity from being achieved (Drozdow 1998). Business continuity planning is resource intensive, but failing to plan is not an acceptable or wise alternative. Businesses cannot reasonably expect their perpetuation if they fail to respond effectively to the changing environment and context of their business, new needs from consumers, and industrial trends.

It is worth mention that the continuity plan itself is only part of the goal of the continuity planning process. A significant aspect of planning is that the planning itself is beneficial to organizations and their focus on risk and surmounting barriers the business might encounter. Sometimes, simpler plans can be more responsive than very detailed plans that constrain organizations' ability to think and respond to threats. Consistent with this, "although policies, processes, and routines provide a framework for action, the actual practice evolves as those in charge of, or involved in, circumstances make sense of the ambiguous information, confused situation, and incomplete data with which they are faced" (Elliott and Macpherson 2010, p. 591).

In emergency management, it is tempting perhaps to consider the concept of continuity as self-evident to businesses and that a simple reminder to consider continuity planning might be sufficient help for most businesses. The unfortunate fact is that most businesses simply do not attend adequately to continuity planning; particularly for small enterprises, the day-to-day activity of the business and the work required to keep a business afloat are time-consuming tasks in their own right, and there is little time left over for planning for the uncertainties of the future or the management of risk. The problem with such thinking is that considering continuity after a hazard event might be too late for management of risk and/or to allow a business to return to operation. While hazard events may disrupt business and community life as a practical matter, disruption to businesses, due to poor or no continuity planning, may be preventable.

Business Approach; Business Strategy; Strategic Planning; Strategy

## Definitions

Business plan is defined as a document setting out a business's future objectives and strategies for achieving them. It can be written in two forms: the narrative and the financial. Some of the components included in a business plan: an executive summary, business introduction, market analysis, competitive analysis, products and services, marketing and sales strategies, organizational structure, and financial projections.

## Introduction

When planning a vacation, you would not jump into a car and just take off on your trip. Instead, time is spent planning the important details such as where you will go, what will you do, how you will get there, and how much it will cost. In the same way, a business plan serves as the roadmap or planning itinerary to help guide individuals starting a business. Writing a business plan will force individuals to slow down and think about every aspect of the business from how it is structured and value propositions to marketing strategies and financial projections. It is an opportunity for individuals to set up and operate a business on paper for 3–5 years without spending any money. This plan can reveal operational red flags and funding gaps as well as uncover market opportunities or simply provide peace of mind in the decision of starting a business.

Typically, a business plan is required when funding is needed, but developing a business plan is important for every business start-up. It will help prospective entrepreneurs determine the feasibility of their business idea, access the best target market for each product/service, and establish benchmarks or goals with sales and profitability.

So, what is a business plan? It is a written document that outlines all the aspects of a business in two forms, the narrative and the financial, and these two forms must tell the same story. The narrative has several sections that together will provide a complete and in-depth look at the business and its operation. These sections include an executive summary, business introduction, market analysis (including industry profile and competitive analysis), products or services, marketing and sales strategies, organizational structure, and financial projections.

- **An executive summary** provides a brief overview of the business plan along with the request, typically a funding request showing how much is needed, the owner's personal investment, and what type of funding is being requested.
- **The business introduction** states the business name, location, legal structure, ownership, and brief description of the business (manufacturing, service, retail). As appropriate, a summary of the start-up or brief history of the company may be added to provide a clearer understanding of the business at this point in time.

- **The market analysis** section provides an overview of the industry and then identifies market segments, target markets, market trends, and market penetration goals. Following this information would include a profile of primary competitors, their strengths and weaknesses, the businesses competitive advantages and disadvantages, and the barriers to entry.
- **The products and services** section provides a detailed description of what the business sells. It will include specific features and targeted customers benefits that would lead to highlighting a unique value proposition. Additional information would be identifying primary suppliers, technology utilization, and distribution channels. There can be a separate operations section, which describes the businesses' processes and procedures and operational capacity. This section would outline product or service order requirements, processing steps, customer delivery, and customer follow-up.
- **The marketing and sales strategies** section outlines the targeted plans to market, promote, and brand the company's products and services. A description of planned strategies should identify what product/service is promoted to what targeted audience, the product pricing model, and the selected distribution channels. Other strategies to discuss may include creating customer experiences, public relations, and collaboration strategies.
- A management summary including **organizational structure** may be included before financials. This part outlines the **organizational structure**, key management team, personnel needs, professional advisors, and planned personnel training. It is important to show a brief description of each position, the number of individuals needed for each position, and the estimated costs.
- The **financial projections** start with identifying how much money is needed to start the business. **An income statement**, also known as a **profit and loss statement**, is used to show how the business generates income and the direct and indirect expenses. This statement included projected sales, cost of goods sold, operating expenses, financing costs, and the bottom-line net result, which is either a profit or loss. This part of the business plan focuses on where the money comes from (sales), how it flows through the business (expenses), and the final outcome (profit or loss). Next, a **cash flow statement** is created to provide the most critical information for your business. This monthly statement shows how much cash your business is projected to generate to meet its financial obligations, when cash is needed and where it will come from. It also shows the purchase capital assets, budgeted owner withdraws, and the calculation of the monthly net income or net loss. Because a cash flow statement carries profits and losses over to the next month, running a loss indicates that the business does not have enough cash to meet expenses. As stated, this statement is critical and is used to show the need for changes in the plans such as adjustments in operations to reduce expenses, pricing changes to increase profitability, or changes to start-up costs or the total funding needed. Finally, a **balance sheet** is developed to calculate the net worth of the business. This statement shows the business assets (cash, inventory, equipment, real estate) less the balance of the businesses liabilities (debt) to equal the business' net worth.

Backup documentation is needed to provide required documents such as resumes, personal financial statements, and income tax returns as well as supporting documents for projected sales, expenses, the purchase of capital assets, and marketing strategies.

Preparing to start a business begins with a business plan. Taking the time to work through the development of this plan will enable you to uncover weakness in your business idea that you can adjust to increase your chance of success. Make a business plan for your first step.

## Global Business Strategy

This section provides an overview on global businesses and their planning. Global brands largely

have an advantage vis à vis the homegrown brands with respect to the strength of their brand. They have a clear understanding of their product and market strength. These brands are largely established financially to search unexplored geographies. What they struggle for is to add a chapter of success to their book. There is no denying the fact that each market for them is a case study, and their past success in home country or such similar markets is no guarantee for future success for even the established players.

Asian markets by virtue of their high population and growing economies are always looked at as opportunities for the western world. Higher population index coupled with growing economies does not guarantee a higher market share. What remains important for these new entrants is to check out the true potential of their product and brand in the market. In India, there is huge population of 1.38 billion (Worldometer n.d.), but the real taxpayers are not even 2.5% of the total population (The Economic Times 2021). Hence, it is extremely important for the new players to evaluate and understand the addressable population and not be allured by the sheer market size looking at the population.

One wrong judgment can lead to a huge financial loss! It clearly depends on which stage the brand planned to enter the market and before taking the final risk, one must definitely evaluate the below factors:

**Stage 1**: Assessing the socioeconomic local market conditions. At this stage, one should gauge the local population in terms of housing conditions, wealth levels, education, purchasing power, and demographic type. It is worthwhile to ascertain whether the economy of the country under discussion is growing at fast pace in terms of Gross Domestic Product (GDP), fiscal deficit, inflation index, current account deficit, and the foreign exchange reserves, or is it stagnant. It is equally important to comprehend the demographic and psychographic profiling of the population at this stage to create a meaningful understanding of the market under discussion.

**Stage 2**: Learning from the established stories. Are there any established players in the market in the similar segment? It is a daunting task for any brand to enter a market with a fresh idea and a business. Every single industry today may seem open to newcomers, and the environment might seem welcoming for start-ups, but even with the greatest business plans and knowledge of your customer base, about 90% start-ups fail within the first few years of their incubation (Patel 2015). So, if you are planning to move forward with a business idea, your timing may be excellent, but you can still learn a lot from the established players or rather your successful predecessors.

Important insights for new entrants are as mentioned below:

- **Innovation is a must**: A brand cannot live on its past laurels. One must constantly keep reinventing and reenergizing. Finland-based Nokia, one of the greatest mobile brands of all times thought it less important to get into smart phone development (Ahmer 2019). Their market demise was rapid, giving way to Samsung a relatively new player in mobile domain.
- **Define your edge**: Domino's Pizza 30-minute delivery policy is one of the best examples of how established players create a cutting edge in this fast-paced competitive landscape.
- **Be competitive**: McDonalds knew that in order to make a strong presence in India, it had to adopt the mantra, "Think Global Act Local." Hence, it launched the Mc AlooTikki burger for the first time anywhere in the world at an affordable price to make it accessible to the masses. This strategy allowed McDonalds to expand and penetrate the India market through a clear focus on affordability, creating a clear benchmark for others to follow. Learning the realities of Indian market, Starbucks a relatively late entrant in food retail preferred to sell a tandoori paneer roll to allure the Indian taste buds when it made inroads

in the Indian market in 2012. Likewise, Dominos introduced two Pizzas at a sharp price of INR 99 to penetrate the market (Sachdeva 2020).

- **Ensure brand consistency**: Brands with global presence create success stories by uniformity of product and brand communication across the globe. Whether you buy an Apple IPhone 12 in India or in the United States, it has similar benefits and features. Additionally, these brands have consistent after-sales service and similar retail environments to give an unparalleled customer experience. This is what sets them apart from the less established players.
- **Make some visible noise**: Simply launching the brand in the market place by virtue of your past achievements is no assurance of creating yet another success story. Hence, it is imperative to create a unique entity that has a consistent communication for the world to know that you are ready to dazzle them.

**Stage 3**: What are the local government laws? This is probably the most important factor that allows one to make the first step. This comes even before assessing the market potential. Imagine a huge market potential but government laws inhibit Foreign Direct Investment (FDI) or the local law has a capping on investment. What are the mandatory government requirements with respect to taxation of the category under discussion? Once we are clear with the local market requirements that is when we begin the next step.

**Stage 4**: Now the next question is how does one decide the best-fit option? Do we hire a market research agency in the local market, or do we gather market intelligence data from local authorities to make progress on our decision or do we do both? Brands typically look for the most apt strategy to enter the market to mitigate the risk, before investing deep. Prior to entering the Indian market, Skechers, a leading footwear brand conducted an in-depth study. To understand the latent potential of the growing athletic leisure wear segment, they examined various entry-level options. They concluded the best option to enter the market was through a joint venture partnership with a local retail giant, Future Group. This partnership enabled them to gain a better understanding of the retail market. Once the FDI options eased in India, they dissolved the partnership to expand and grow independently. Does it mean this is the best strategy or an established strategy – the answer is a big **NO!**

The Global ecommerce giant Amazon preferred to enter direct and used all its financial muscle to make gradual but strong inroads in the Indian market. However, the same strategy could not work for Amazon while entering China. Alibaba, the homegrown e-commerce giant is the most established company in China, and the local government laws did not support FDI. It is important to understand that it is not only the market potential but also the local laws that support your vision. Decisions are based on a variety of factors (Tulman n.d.).

The other critical factor to consider is the size of the opportunity and not just the opportunity. There are various instances wherein there is an opportunity, but it does not have the scale for the new entrant to make inroads. This is the typical case for luxury brands entering developing economies. The BRICS (Brazil, Russia, India, China, and South Africa) markets, more specifically China and India rather than Brazil and Russia, have been in the spotlight for the past few years. Analysts and marketers across the world have always looked at China and India as two strong-growing economies to establish luxury brands. Yes, there is a strong emergence but is it across the country or is it confined to some pockets? The markets of Delhi, Mumbai, and Bangalore contribute to almost 90% of organized luxury retail of India (Dhawan 2020). Hence, despite some great socioeconomic indicators that support the resurgence of luxury retail in India, it is limited to specific areas. What is interesting to note is most of the luxury retailers in lifestyle domain still prefer to adopt the joint venture or franchising route to rationalize operating costs. With this

backdrop, the major takeaway is to assess the size of opportunity and not just the potential.

**Cricket**, one of the favorite sports in the Asian countries in which two sides of 11 players play against each other has three different formats: 50 overs or 20 overs a side match or a 5-day test match. In a 50 over format, each side gets to bat and bowl 50 overs. In one over, 6 times the batsman and bowler get an opportunity to play against each other and the maximum score a batsman can score in an over is 36. This makes one believe that the maximum opportunity a team has in a 50 over format is to score 1800 in a match. The reality is not even a single cricket-playing nation in the last 50 years of its existence, has even scored one-third of the maximum potential. Similarly, in business scenarios one should clearly estimate the real size of the opportunity and not just the potential because one wrong assessment can wash away all the finances. On the contrary, if an entrepreneur does his/her homework correctly, the results can be dramatically opposite.

**Ferns N Petals**, perhaps one of the largest florist chains in the world started over two decades ago in Delhi. Today, there are 240 retail stores in India, and it has begun to go Global with its presence in the Middle East and South East Asia. It remains a profitable company without investor funding or any debts. What set this florist chain apart was its ability to identify the opportunity at the right time and building block by block with clear measurable outcomes. The right market assessment allowed a small-time entrepreneurial venture to translate into an enviable profitable organization. The important learning here is to strike the iron when it is hot.

**Adidas**, the major German sportswear company began its operations in India in 1995, by identifying the opportunity. With an average age of 29, India is the youngest nation in the world with a growing economy and supportive socio-economic indicators (Financial Express 2017). Although the government laws then did not completely support FDI, it was the right time to harness the opportunity before it was too late. The deep pockets of Adidas coupled with their patience allowed this sportswear giant to make some gradual profits albeit after almost two decades of its existence (Prabhakar and Chakravarty 2012).

## Funding Options for Entrepreneurs

Although an entrepreneur has quite a few options to fund his business, the most popular ones include:

(I) **An angel investor** (also known as a private investor, seed investor, or angel funder) is a high-net-worth individual who provides financial backing for small start-ups or entrepreneurs, typically in exchange for ownership equity in the company. Often, angel investors are found among an entrepreneur's family and friends. Although, it might seem an easy pick for some because it is relatively easy to sell a proposal to an individual than to a set of individuals. However, angel investors come with deeper insight as they tend to spot and nurture unusual talent. The Internet is full of options for entrepreneurs to reach out to some of the best angel investors.

(II) **Venture capital** (VC) is a form of private equity and a type of financing that investors provide to start-up companies and small businesses that are believed to have long-term growth potential. Venture capital generally comes from well-off investors, investment banks, and other types of financial institutions. Entrepreneurs can seek this as an option if they do not have physical collateral to pledge to a bank. However, in lieu of the same, they have to part with a percentage of their ownership on a negotiated basis to the VC. Typically, at the start of your business, an angel investor comes to play, and a VC helps scale the business to the next level. Both angel investors and VCs have experience across a variety of industries and can help business ideas to flourish and grow.

(III) **Crowdfunding** is the practice of funding a project or venture by raising small amounts of money from a large number of people,

typically via the Internet. Crowdfunding is a form of crowdsourcing and alternative finance. Crowdfunding on platforms such as Kickstarter and Indiegogo can give a financial boost to small businesses. These platforms allow businesses to pool small investments from several investors instead of seeking out a single investment source. By using crowdfunding, entrepreneurs can raise the necessary seed funds to get their start-up through the development phase and ready to pitch to investors.

(IV) **Bootstrapping** is building a company from the ground up with nothing but personal savings and luck. Cash comes from the first sales. Such businesses typically lack scalability.

## Example of Evolving Finance

**Flipkart**, a homegrown e-commerce major started with humble beginnings by two young tech entrepreneurs in 2007 in India. It is probably the best example in recent times of how a strong idea coupled with a great vision can evolve in a great success story that the world envies. Although the duo Sachin and Binny Flipkart cofounders started with a small seed capital, they got initial support by an angel investor, who enabled them to believe in and launch their dream. The real thrust came with phased investments (2009–2016) from VC giants including Tiger Global, Naspers, Morgan Stanley, and a few others which allowed the entrepreneurs to scale their project. Flipkart grew exponentially in a short time, which led to its acquisition by Walmart to compete with Amazon in the fast-emerging Indian e-commerce market (Chakraborty 2017).

## Conclusion

Business planning is the first step for any entrepreneur to start. Careful planning and positive approach can help business succeed. It is extremely important to create a product or service that is not only high on innovation and market acceptance but also is adequately supported with scalability. One can have a brilliant idea, but in order to make his/her presence felt, one needs to create the much-needed desire not only for the market but also for people to invest in your dream venture. For an entrepreneur, it is all about make or break. It becomes very important to do it right at the first instance because one wrong decision can really jeopardize the entire venture. For an entrepreneur to succeed, it is extremely important to have subject expertise and to create something unique for the world to acknowledge and accept. Innovation in product, service, marketing, technology, or all the above sets apart a successful entrepreneur from the mediocre.

# Butterfly Theory of Crisis Management

Stuart C. Strother
Azusa Pacific University, Azusa, CA, USA

## Synonyms

Chaos theory; Dynamic systems; Non-linear systems

## Introduction

The single flap of a butterfly's wings in Brazil generates a minor atmospheric disturbance continuously expanding to produce a tornado in Texas a month later. This butterfly effect, often attributed to Lorenz (1963), and sometimes called butterfly theory, suggests small events may generate large consequences. Butterfly theory was initially applied to meteorology, but in recent years, the theory has been applied to other fields including mathematics, physics, and economics. This paper applies butterfly theory to matters of crisis management in public administration.

## Butterfly Theory

"Does the flap of a butterfly's wings in Brazil set a tornado in Brazil?" was the question posed by meteorologist Edward N. Lorenz at a national meeting of scientists in 1972. In asking the question, Lorenz challenged conventional notions of science, such as deterministic and linear systems.

Butterfly theory contends a small input may result in a disproportionately large output. Synonyms include chaos theory and stochastic systems. Black swan events and the random walk theory are related to butterfly theory.

A *deterministic* system is one in which randomness does not exist. Independent variables precisely predict dependent variables. In public administration, for example, a new policy mandating a two dollar per hour increase in workers' minimum wages results in each worker receiving two more dollars. A conventional *linear* system is illustrated here, as each worker receives exactly two additional dollars for each hour worked. Linear systems, a type of scientific modeling, assume a reliable mathematical relationship between variables.

Whereas theories of linear systems facilitate elegant scientific models, and comforting forecasts, the empirical reality may differ significantly. As recent events in Los Angeles, San Francisco, and Seattle reveal (Puzder 2015) the raising of minimum wages by fiat, does not result in higher earnings for the workers but, in fact, lower earnings. Profit-maximizing companies, following Coase's (1937) theory of the firm and tendencies of capital mobility, have been found to move their operations away from cities where minimum wage laws have been enacted. Factor substitution is also implemented, as machines assume functions previously performed by workers. And so, in a nod to the theory of unintended consequences, public administrators intending to aid the working man have instead done him harm.

*Chaos theory* rebuffs, or redefines, notions of deterministic and linear systems. Whereas linear systems suggest initial present conditions may predict future conditions, chaos theory emphasizes the possibility that initial conditions may

not be fully understood; therefore, future conditions may widely differ from what the deterministic models predict. A gentle 5 mph breeze in Brazil surely would not predict high winds in Texas, but the additional flap of the butterfly's wing may be the tipping point to create the eventual tornado.

Malcolm Gladwell, in his best-selling book, *The Tipping Point* (Gladwell 2002), offers an example of crime reduction in New York City. High crime rates in the 1980s were reduced in the 1990s as a result of application of the *broken windows theory*. Police cracked down on petty crimes such as graffiti and jumping subway turnstiles. The subsequent reduction of serious crimes was attributed to the zero tolerance for small crimes. Tipping points are akin to butterfly theory, in that a small cause sets the course for a large effect.

*Stochastic* systems contradict deterministic systems, in that random variables are included in the models. A distribution of outcomes may be estimated employing probability, but precise outcomes cannot be predicted. Malkiel's (1973) *random walk theory* is an example of stochastic systems. The direction a drunk man walks after exiting the bar is random; he may go left, right, straight, or fall on his face and not walk anywhere. Butterfly theory exists as a subtext within chaos theory and stochastic models.

Malkiel applied his theory to financial instruments, especially stocks. Numerous public organizations, especially public pension funds and municipal governments followed deterministic logic in investing assets in a multitude of financial securities. Many were overexposed when they bought mortgage-backed securities. CalPERS and CalSTRS, pension funds for public employees in California, lost as much as $1.6 billion as a result of the housing crash of 2007–2008 (Lifsher 2015).

Taleb's (2007) *black swan theory* is related to butterfly theory. Evidence of thousands of white swans does not serve as proof that all are white. Instead, the appearance of one black swan can disprove the notion that all swans are white. And so the black swan is a metaphor of an extremely low probability event that has large impacts.

In 1973, residents of California's conservative and wealthy Orange County elected Bob Citron treasurer. Citron managed the county's finances, including a large investment portfolio. His strategy, widely avoided in most finance circles, was to "borrow short to invest long" (Ludwig 1995, p. 37). By 1994, Citron accumulated $1.6 billion in "paper losses," representing a reduction in portfolio assets of nearly one fourth. The County declared bankruptcy. Local government leaders made a crisis management mistake in not preparing for the low probability event that the actions of a single employee, with no formal training in finance, could create a magnanimous disaster impacting public services, schools, and jobs.

Whereas butterfly theory focuses on magnitude (small event, large consequences), black swan theory focuses on timing (low probability event, large consequences).

## Crisis Management

Crisis management is the process of planning for and responding to events that can harm an organization. By definition, a crisis is a major event with extremely harmful effects to both internal and external stakeholders. Normal routine procedures are not capable of coping with the disruption (Booth 1993). Regarding timing, crises generally occur suddenly, require quick reaction time, and have greater impact the longer the duration of the crisis. The organization is likely to be permanently changed after the crisis (Venette 2003).

As a field of study, crisis management is relatively young, with the literature developing after a number of environmental and industrial disasters of the 1980s, such as the 1980 eruption of Mt. St. Helens, the 1983 bombing of US and French military barracks in Beirut, the 1986 nuclear meltdown in Chernobyl, and the 1988 explosion of Pan Am Flight 103 over Lockerbie, Scotland. A number of high-profile tragedies in the private sector also contributed to the emergence of crisis management theories and practices. In 1982, a miscreant added cyanide to Tylenol capsules resulting in seven deaths and over $100 million in losses for parent company Johnson & Johnson.

In 1992, a woman received third-degree burns from scalding coffee from McDonald's, resulting in an initial judgment of $2.9 million against the company.

## GHP Model of Crisis Management

Current literature on crisis management is abundant and rife with numerous theories, models, and heuristics. Gonzáles-Herrero and Pratt (1995) offer a common sense model of crisis management applicable to both public and private sectors. The model consists of four phases: (1) issues management, (2) planning-prevention, (3) the crisis, and (4) the post-crisis.

Issues management is the first phase of crisis management, wherein managers "scan the environment" looking for, and collecting data on, trends or single issues that could become crises. In the context of readiness planning for municipal governments, Vastveit et al. (2014) suggest this initial phase generates a "risk image" describing the stakeholders' views of threats. The risk image contains likelihood or probability of events and the potential consequences of those events.

Many threats can be identified in advance, but some cannot. As Defense Secretary Donald Rumsfeld famously quipped, "There are known knowns. . .we also know there are known unknowns." Public officials in California know earthquakes will occur in the future and make readiness plans. Regarding a terrorist attack, those same officials do not know whether such an attack will occur nor do they know the time or place. Nonetheless, public sector leaders plan for both earthquakes and terrorist attacks.

The second phase of crisis management, planning-prevention, consists of setting proactive policy to respond to potential crises identified in the issues management phase, analyzing "the organization's links with multiple constituencies," and preparing "general or specific contingency plans" (Gonzáles-Herrero and Pratt 1995, p. 28). A forthcoming crisis could be known as imminent; for example, after the rogue trader forced Orange County into bankruptcy, other municipalities with similar investment portfolios should brace for a comparable imminent crisis.

Similarly, the planning-prevention phase may identify an existing problem that has the potential to evolve into a full-scale crisis. City leaders in Detroit, for example, had full knowledge of the city's fiscal shortfalls and made plans for the 2013 bankruptcy filing.

The crisis is the third phase of crisis management. Gonzáles-Herrero and Pratt suggest at this phase that the organization evaluates the organization's response to the crisis, preempts negative publicity, and "targets" the organization's message to "appropriate audiences" (1995, p. 29).

Here, the model falls short, as the organization's leaders, when faced with a new crisis, should focus their energy on resolving the crisis and minimizing harm to internal and external stakeholders. When a crisis hits, public relations although important take a backseat to actually resolving the crisis. When faced with the 2015 crisis of using a private, and potentially insecure, email server for US State Department business, Secretary Hillary Clinton appeared to commit more energy to manage public perception of the event than to actually resolve the crisis by protecting sensitive government data.

In the fourth and final post-crisis phase of the Gonzáles-Herrero and Pratt crisis management model, the organization monitors the crisis "until its intensity is reduced," informs stakeholders and the media of the organization's actions, and "evaluates how the crisis plan, if one existed, worked" (1995, p. 29). As Venette (2003) warned, the organization may never be the same. Gonzáles-Herrero and Pratt note the organization "yearns for bygone glorious days" (1995, p. 29).

Hurricane Katrina of 2005 was the costliest natural disaster in US history. Despite accurate forecasting and ample lead time, the hurricane's landfall generated more than 50 levee breaches resulting in over 1200 deaths and more than $100 billion in property damage. The US Army Corps of Engineers was found culpable for using inadequate levee building materials.

The crisis was also exacerbated by feckless responses by local, state, and federal entities including the New Orleans Police Department,

the Louisiana governor's office, and the Federal Emergency Management Agency. Farazmand criticized the public sector response to Hurricane Katrina as "a global case of grand failure in, governance, leadership, and public management" (2009, p. 399). A perfect storm of bureaucratic failure accompanied the literal perfect storm of the hurricane.

Whereas public administrators responsible to respond to the crisis had certainly received ample training in crisis management, copious failures occurred both in resolving the crisis and in the post-crisis phase. Years after the hurricane, several New Orleans neighborhoods remain destroyed and serve as reminders of the destructive power of the hurricane and the compounding effects of poor leadership.

## Butterfly Theory of Crisis Management

Numerous theories and models, such as the Gonzáles-Herrero and Pratt (1995) model, offer thoughtful and practical tools for crisis management. This paper adds butterfly theory to the existing literature of crisis management. Butterfly theory of crisis management suggests crisis managers should anticipate, and prepare to respond to, small and low probability events that have the potential to result in major harmful crises.

Butterfly theory avers that small events may cause large effects. Similarly, black swan theory asserts low probability events may cause large effects. These theories apply to the first "issues management" phase of the Gonzáles-Herrero and Pratt (1995) model. While "risk images" are being developed, leaders are obliged to consider small issues, and improbable events, that threaten the organization with substantial harmful effects.

Paradoxically, black swan events are not predictable by definition. Whereas every possible threat cannot feasibly be anticipated, leaders are obligated to be well informed of various small events threatening the organization's status quo.

As part of crisis management strategy, leaders should prepare contingency plans for small and low probability events that might result in a crisis. Many of these events can be anticipated including natural disasters, severe weather, fires, chemical spills, bus crashes, bomb threats, disease outbreaks, terrorism, active shooters, and employee malfeasance.

In addition to preparing for butterfly effects as the cause of crises, leaders should also be open to butterfly effects as possible solutions to crises. Hong and Sun (2000) cite butterfly effects as critical events to the normalization of diplomatic relations between China and the USA in the 1970s. Relations between the two nations had soured during the Cold War. But during an international competition in Japan, American and Chinese national ping pong teams had friendly interactions, beginning with an American player accidentally boarding the Chinese team's bus. A number of additional butterfly effects took place, resulting in the eventual rapprochement between the USA and China.

Leaders cannot feasibly anticipate all threats, just as weather forecasters cannot monitor every flap of a butterfly's wings in a far-off continent. Nonetheless, those engaged in crisis management would do well to include the possibility of small and low probability events in their crisis management plans.

## Capacity Building

Veronica Junjan
Department of Public Administration, University of Twente, Enschede, The Netherlands

### Synonyms

Administrative reforms; Organization development; Public administration reform

### Definition

Capacity building refers to a broad palette of techniques and methods that help individuals, organizations, and communities develop solutions to address the obstacles which prevent them in reaching their development goals.

### Introduction

This entry provides first an overview of the main characteristics of the concept and a short historical overview. Subsequent sections present profiles for the different approaches developed over time, with particular focus on administrative capacity building. A separate section discusses the relationship between the concept of "capacity building" and of "capability approach."

### Concept Characteristics and Historical Evolution

Present in the policy discourse and in the scientific studies during the 1960s as a component of administration development (Pollitt and Bouckaert 2011), the concept of "capacity development" was initially coupled to the reconstruction efforts focused on development public administration in the newly set-up states. The concept started to be used more intensely during the 1970s, primarily by the United Nations Development Programme. At the time, its primary meaning referred to the provision of assistance for "institution building". The activities included under this term were focused on designing organizations able to provide different types of public services to the citizen, and on developing human resources able to provide the new types of services needed at societal level.

Capacity building (re)emerged in the 1990s as a consequence of the efforts undertaken internationally towards major societal reconstruction realized to a large extent in developing countries. These actions were concentrated in the beginning in the area of international development. This approach became central to the activities undertaken both by major international organizations carrying out activities in the area of international development (World Bank WB, United Nations UN, United Nations Development Programme UNDP, European Commission EC/EU,

Organization for Economic Cooperation Development OECD). National based public and nonprofit organizations, such as Canadian International Development Agency CIDA, Deutsche Gesellschaft für Internationale Zusammenarbeit GmbH (GIZ GmbH Germany), or Swedish International Development Agency (Sweden) played prominent roles in providing capacity assistance programs to different countries.

The variety of the organizations used and defined the concept according to their own goals, and the term lost its focus to a certain extent. An analysis of the definitions used by major organizations in the area of international development helps outline several dimensions of the concept of capacity building. These dimensions are: (a) focus on process; (b)different constellations of actors (often at micro and meso level: individuals, organizations, communities), (c) tasks, such as strengthening individual knowledge – at micro level – and skills and organizational abilities – at meso level – in different functional areas (for instance, human relations management, technological skills, project management skills, etc.), and (d) goals (improve performance, streamline service provision, strengthen accountability).

Capacity building efforts tend to be stratified depending on the actor's level (individual, organization, community), with the ultimate goal of contributing to the adequate service provision at societal level-macro level. The types of activities carried out depend, as well, on the actor's level and range from national-broad programs to local level individual and nonprofit-based activities providing responses to local community needs.

The concept of capacity is being "crucial to the success of the nations" (El-Taliawi and Van Der Wal 2019:246). Throughout the years, the concept took different forms in the public administration literature: state capacity, policy capacity, managerial capacity, and administrative capacity. Arguably, these dimensions can be split across the macro-meso dimension. State capacity can be considered as macro-level capacity and the policy, managerial and administrative capacities can be considered as dimensions to be investigated at meso (or organizational) level. A two-dimensional conceptualization of the policy capacity focusing on skills and resources is proposed by Wu et al. (2015:166–167). They distinguish between the *types of capacity* (analytical, operational, and political) and the *level* where this capacity is analyzed (individual, organizational, and systemic) (Table 1).

Administrative capacity would require -according to this conceptualization- analytical and operational competences at individual and organizational level.

## Administrative Reform and Capacity Building

Public sector reforms characterized the societal changes in the majority of countries in the last forty years. Each regional area had to deal with its own challenges, ranging from developing the state institutions, to (re)developing economic capacity, or developing social services (such as education and health). Within the different geographical areas in which capacity building activities took place, Central and Eastern Europe represents a particular case of reforms due to the trigger of the reforms, the collapse of the Soviet

**Capacity Building, Table 1** Policy capacity, skills and resources

| Levels of resources and capabilities | Skills and competencies | | |
|---|---|---|---|
| | Analytical | Operational | Political |
| Individual | Individual analytical capacity | Individual operational capacity | Individual political capacity |
| Organizational | Organizational analytical capacity | Organizational operational capacity | Organizational political capacity |
| Systemic | Systemic analytical capacity | Systemic operational capacity | Systemic political capacity |

Union, and the transition from a bipolar to a multipolar world order. The reforms in Central and Eastern Europe took a particular direction because they were directed by the assumed goal of the countries to join European Union. In comparison to previous waves of European Union enlargement, for instance the Southern Enlargement where Greece, Spain, and Portugal joined the EU and where political institutions needed primary attention, in the Eastern Enlargement both democratic political institutions and a functional market economy had to be rebuilt (Milward et al. 2016). The pre-1989 institutional setting of the Central and Eastern European countries was characterized to large extent of state property, state centralization of the economy, and a very strong level of politicization of the public service. This combination of characteristics led to the situation that the Eastern European states had to fulfill a multiple challenge by reforming political and economic institutions, and by having to develop their administrative capacity to a level necessary to function in the EU.

This capacity building challenge consisted of (a) conduct the process of state withdrawal from the economy and, (b) to reorganize the state on democratic bases. Consequently, the reform and capacity building efforts were initially focused on (political) institutions (multi-party system, free elections, Constitution). Particularly relevant for the purpose of this discussion is to observe that the neo-institutional approach was the primary approach used in designing and executing measures aimed towards capacity development. This focus resulted in stressing privatization and marketization of services and tasks provided before by the state. Moreover, less -if any- attention was dedicated to the classical institutional approach oriented towards the idea of "fit" between the old and new institutions and towards the influence of path dependencies in introducing social change (Gamal and Vaughan 2002).

Administrative capacity came later to attention of both academics studying European integration as well as of the policy makers developing the measures required during the accession process. It took time until it became clear that in order to implement policies, a certain level of capacity is needed. Decision makers and academics alike understood that focusing reforms only on political institutions, only on legislation adoption, or on setting the grounds for functioning market economies did not automatically lead to achieving the expected outcomes of political stability and economic prosperity. Understanding that administrative organizations in these countries simply did not have the necessary resources and capacity required for implementation led to the articulation of efforts necessary to develop the missing competences. Academics and policy makers alike had to be reminded that the existence of administration capacity should not be taken for granted.

The other interesting aspect of the challenge consists of the assumptions that (a) the policy change will be automatically implemented at organization level and (b) the change adopted in the central government will be automatically adopted and implemented as intended at local level. These assumptions were based on the European continental tradition of organizing public administration around legislation. Extensive reliance upon legislation as policy instrument lends itself easily to implementation inconsistency. This happens particularly when little attention is paid to ensuring the coordination and coherence among the content and the requirements of different pieces of legislation. Eventually, this leads to confusion among the executing authorities, and makes the implementation process very tortuous. Moreover, exclusive actions directed towards conducting change at a central level lead to the forming of "pockets of excellence" which, without sufficient levels of structural support, become isolated within the general body of the civil servants. Two consequences resulted from including these assumptions in the reforms: first, that the reform efforts were focused primarily at the central government level, and second, that only quite late in the accession process the decision-making attention was dedicated to the administrative capacity building.

Another characteristic of administrative capacity building resulted from the involvement of international actors such as World Bank, International Monetary Fund, the Organization for Economic Co-operation and Development

(particularly through the initiative named Support for Improvement in Governance and Management) which provided support for capacity building actors. In addition, national development agencies and nonprofit organizations were active in the capacity building (Sobis and de Vries 2009). The relationship between the involvement of international actors – public and nonprofit – and the domestic political and societal actors tends to be rather delicate one, given the unequal power relationships developed between the two sets of actors (international donor and domestic actors) during such a capacity development program. A particular case represents the capacity building effort organized within the process launched by a number of the countries of Central and Eastern Europe with the aim to join the European Union. This process has been analyzed in the academic literature under the name of Europeanization of public administration. The asymmetric relationship between the candidate countries and the European Union (through the European Commission) has been analyzed in the academic literature from the perspective of conditionality (Schimmelfennig and Sedelmeier 2005).

In administrative terms, Europeanization process aimed to develop administrative systems able to function within EU's institutional framework. In assessing Public Administration Reforms, the term "administrative capacity" was initially operationalized through the Support for Improvement in Governance and Management initiative also known as SIGMA (1998, 1999) outlined in terms of achieving acceptable standards of reliability, predictability, accountability, transparency, efficiency, and effectiveness in policy-making (Cardona 2009). This implies that, during and after accession, Central and Eastern European countries reform efforts were focused towards building organizational and administrative capacity in order to develop institutions able to (a) act reliable and predictable according to the rule of law and the nondiscrimination principle; (b) answer to and be held accountable by other administrative, legislative, or juridical authorities; (c) function transparently and be open to external scrutiny; and (d) able to maintain an appropriate ratio between inputs, outputs, and outcomes, and act according to efficiency and effectiveness criteria of performance.

It needs to be specified as well that the dynamic process behind the development of administrative capacity is quite specific to the regional and country level. The particular characteristics of the political regime and the political-administrative relationships, the historical legacies, and the path dependencies have very strong consequences for the development of administrative capacity in a country or at regional level. Jreisat (2012) applies a number of dimensions for administrative capacity development for the case of the Arab States, such as integration of the different elements of the management systems, data and knowledge deficit, level of centralization in bureaucracy, transparency and accountability, and political capacity, emphasizes the idea of strategic thinking in order to develop administrative capacity. Jreisat (2012) pleads for a rethinking of administrative capacity as a crucial characteristic required for the governing of society (also Farazmand 2009: 1016, 1017), from the increasing rhythm of societal change, from globalization and the rapid change and impact of technology (Jreisat 2012:140).

## Capability

The concept of capability is connected to the one of "capacity building." The concepts of "capacity" and "capability" are sometimes used interchangeably. There are, however, arguments to use them as synonyms, as well as arguments to separate them. On the one hand, it can be debatable to separate the two terms which address, in essence, the fundamental task of analyzing a given situation and, if considered necessary, take measures to address the difference between the current situation and the desired situation, such as through making deliberate efforts to acquire new skills. On the other hand, there are arguments to separate the two given their central focus: whereas capacity focuses on problem diagnosis, capability focuses on the acquiring of the particular skill (a person's ability to execute a particular

task). Both imply the existence of separate skill sets, such as diagnosis skills required to identify that there is a problem for capacity, and the decision making required to undertake measures needed to address a perceived problematic situation in the capability. It is important to define the individual and context factors that make a difference for the necessity to act. Finally, capability has a clear normative component and seems to be focused on conceptualization, and capacity has a strong explanatory and empirical component.

Capability approach is an interdisciplinary theoretical framework developed in order to define and evaluate poverty, inequality, or well-being, at individual and societal level, in order to support policy design and policy development aimed to bring change in society (Robeyns 2005:94). Capability approach has a normative component and focuses on what people are in practice able to do. This approach goes beyond strict utilitarian components of a "package of skills" that allow people to perform certain tasks and it is highly contextualized to the situation where the person whose abilities are being developed does function. The concept of capability allows to deepen the analysis and take into account both the specific situation and context in which the skill development takes place, and the individual freedom to choose the ways to pursue one's life according to the desired goals. The theoretical grounds of the capability approach lay with the work of Amartya Sen (1985) and Martha Nussbaum. Whereas Sen's argument is developed more towards policy formulation towards supporting individuals learn the skills they need to achieve freedom and the type of life they aim to pursue, Nussbaum's approach focuses more on developing a partial theory of justice.

In the capability approach, the distinction between means and ends is important, as the latter have an intrinsic importance: well-being, justice, and development framed in terms of people's capability to function (Robeyns 2005:95). Additionally, this distinction allows to differentiate between what is achieved and what is effectively possible, and therefore accounts for the conditions of the actual implementation and application of the learned skills. This difference has an important consequence for the policy evaluation, allowing to take into account the context and the extent to which the acquiring of a particular skills does contribute to the achieving a fulfilling life as imagined by the individual. This is particularly important for the policies whose objective is designed have an impact for the development of individual abilities to pursue individually defined goals. This extends the possibilities for evaluation also, for instance, to address the latent mechanisms that contribute to the development of social inequality present also in developed and well-off societies. Martha Nussbaum (2004) develops further the capability approach by arguing that the governments should sanction a list of "central human capabilities" and include them within the fundamental rights which should stay at the grounding of the development of each citizen. Her approach is on the legal-moral-normative dimension, and provides a universalistic perspective on human development.

## Conclusion

The discussion regarding capacity building requires an increased attention, both by academics as well as by policy makers. The current societal challenges faced by governments needing to respond to global challenges such as pandemics, change in volume and direction of human migration flows, climate change, or technologically induced situations such as cyber-crime and cyber terrorism, require new types of responses as well as new mechanisms of coordination for governments and across governments and societal actors such as nonprofit organizations and private sector. These types of responses require, on their turn, a different mindset of governing societies. First, the understanding that, even though governments are ultimately responsible to execute their core tasks on providing public services security and safety, they cannot do it alone. Cooperation with societal actors is essential, particularly in cases of emergency response. Citizens demand more and more involvement in the formulation and, at times, even in the execution of policies. Second, that these new challenges require new

sets of skills and resources, both analytical and operational, at individual and organizational level. These rapid changes require a continuously evolving mindset, focused on learning to deal with constant change, which makes administrative capacity a dynamic characteristic of governments both at organizational and at the individual level.

The crucial question is how to find the suitable balance between the constant change and the necessary level of equilibrium required for a smooth operation of governmental organizations within a turbulent environment. One possible answer could be provided in the re-assessment of the lessons learned from the administrative capacity building literature in developing countries and in transition countries. In the recent decennia, these countries have conducted major political and administrative reforms, and executed them with variable degree of success. It is important to realize that these reforms, major societal changes, were achieved in a constantly changing political, economic, and technological environment. The literature was primarily focused on analyzing mechanisms behind failures in policy development, implementation, or goal achievement with arguably more limited interest on understanding mechanisms behind success. It is also relevant to bear in mind that success was usually defined in terms and standards characteristics to developed states with relatively extended track records of functioning administrations. With the possible exceptions in policy areas such as water management or natural disaster mitigation, limited attention was given towards understanding mechanisms of transfer of knowledge from the developing countries to the developed countries – with all the caveats needed by the definitions of the concept of development.

The countries which have already dealt with a high level of instability and still managed to develop adequate governmental responses to societal challenges can offer insights on the parameters and ways to deal with developing administrative capacity so highly needed to address current societal challenges. Because, in the words of Farazmand (2009: 1016) "Nothing gets done without administrative capacity."

# Capital Budgeting

Natalia Aversano
Department of Mathematics, Computer Science and Economics, University of Basilicata, Potenza (PZ), Italy

## Synonyms

Investment decision-making or capital expenditure decisions; Long-term planning; Planning capital expenditure

## Definition

The process in which a business determines whether projects such as building a new plant or investing in a long-term venture are worth pursuing.

In the public sector, the term is often exclusively associated with infrastructure investments – plant and equipment. It is more properly associated with all policy choices that have significant, long-term consequences. The purchase of a central computer system, establishing or expanding public utility services, and implementing new public transportation systems are examples of capital asset acquisitions that are considered by public sector organizations.

## Introduction

One of the most vital functions of the public sector entity is to construct, maintain, and develop the public works infrastructure. Capital investments including roadways, bridges, sanitary sewers, water mains, and other essential public facilities need to be improved in the aim to satisfy the expectation of the residents and commercial enterprises.

Allocating scarce resources among alternative programs is one of the most important and difficult tasks of public sector organizations' administrators. Usually, a relevant part of these resources is appropriated for the acquisition of long-term "capital assets." "Capital," according to the broadest definition, refers to any asset – physical or intangible – that provides benefits over the long run (beyond the standard budgeting/reporting period). Most narrowly defined, capital includes only long-term physical assets (buildings, roads, equipment, etc.). Most governments, as well as the private sector, choose a definition for capital somewhere in between these two extremes (Holtz-Eakin 1992).

The selection of capital assets is one of the most complex and crucial decisions that public sector administrators have to take; it is very difficult measuring the cost and the benefits related to this investments, and because of the long periods for which resources must be committed, capital asset investment decisions are subject to considerable risk.

For taking this decision, managers of public sector organizations use sophisticated capital budgeting practices in selecting capital investment alternatives coming from private sector context; in fact, no capital investment decision model has been developed specifically for use in the public sector.

In accordance to the literature, it has been suggested that quantitative models from the corporate sector may be potentially useful to public sector managers; others, on the contrary, say that current capital budgeting techniques have been formulated to be used within a profit-oriented context; therefore they do not match with the aims of the public sector organizations. Profit maximization is not a primary objective in the public sector, but rather the allocation of scarce resources in a manner that will maximize the quantity and quality of public service (Kee and Robbins 1991).

## Public Financial Management (PFM) and Capital Budgeting

Public investment is an important potential contributor to economic growth and achievement of social development objectives. In addition to the level of investment and the sectoral allocation, the

capital budgeting process is an important determinant of the quality of investment projects and their implementation. Recent years have seen renewed attention to capital investment for economic growth and development (Dorotinsky 2008).

Despite the importance of special attention to capital assets, the capital budgeting process cannot be considered outside of the overall public financial management system. Capital spending is only one component of spending and needs to be considered within the context of government-wide and sector-specific multiyear strategies and objectives. The capital budgeting process must be fully integrated into the general budgeting and public financial management process.

## Capital Budgeting Techniques

Capital budgeting decisions require careful analysis because they are usually the most difficult and risky decisions that managers make. These decisions are difficult because they require predicting events that will not occur until well into the future. These predictions can be unreliable. Specifically, a capital budgeting decision is risky because (1) the outcome is uncertain and (2) large amounts of money are usually involved. Risk is especially high for investments in technology due to innovations and uncertainty.

Several quantitative methods can be used to evaluate capital budgeting decisions and for analyzing potential capital investments in the corporate sector. Suggested models include *the payback period*, *accounting rate of return (ARR)*, *internal rate of return (IRR)*, *net present value (NPV)*, and *benefit-cost ratio*.

The ***payback period*** is the length of time required to recover the cost of an investment. The payback period of a given investment or project is an important determinant of whether to undertake the position or project, as longer payback periods are typically not desirable for investment positions.

The payback period is probably the simplest method and, usually, managers sometimes use this method when they have limited cash to invest and a number of projects to choose from.

The ***accounting rate of return (ARR)*** is the amount of profit, or return, that an individual can expect based on an investment made. Accounting rate of return divides the average profit by the initial investment in order to get the ratio or return that can be expected. This allows an investor to easily compare the profit potential for projects, products, and investments. ARR is considered a straight-line method of gathering quantitative information. While this is a positive measure in some aspects, its lack of sophistication is also a drawback. ARR does not consider the time value of money, which means that returns taken in during later years may be worth less than those taken in now, and does not consider cash flows, which can be an integral part of maintaining a business.

***The internal rate of return (IRR)*** is a metric used in capital budgeting measuring the profitability of potential investments. Internal rate of return is a discount rate that makes the net present value (NPV) of all cash flows from a particular project equal to zero. IRR calculations rely on the same formula as NPV does. IRR is uniform for investments of varying types, and, as such, IRR can be used to rank multiple prospective projects a firm is considering on a relatively even basis. Assuming the costs of investment are equal among the various projects, the project with the highest IRR would probably be considered the best and undertaken first. IRR is sometimes referred to as "economic rate of return" (ERR).

***The net present value (NPV)*** is the difference between the present value of cash inflows and the present value of cash outflows. A positive net present value indicates that the projected earnings generated by a project or investment (in present money) exceed the anticipated costs (also in present money). Generally, an investment with a positive NPV will be a profitable one and one with a negative NPV will result in a net loss. This concept is the basis for the net present value rule, which dictates that the only investments that should be made are those with positive NPV values.

Determining the value of a project is challenging because there are different ways to measure the value of future cash flows. Because of the time value of money (TVM), money in the present is worth more than the same amount in the future.

The discount rate element of the NPV formula is a way to account for this. Companies may often have different ways of identifying the discount rate. Common methods for determining the discount rate include using the expected return of other investment choices with a similar level of risk (rates of return investors will expect) or the costs associated with borrowing money needed to finance the project.

A ***benefit-cost ratio (BCR)*** is an indicator, used in the formal discipline of cost-benefit analysis, that attempts to summarize the overall value for money of a project or proposal. A BCR is the ratio of the benefits of a project or proposal, expressed in monetary terms, relative to its costs, and also expressed in monetary terms. All benefits and costs should be expressed in discounted present values.

Benefit-cost ratio (BCR) takes into account the amount of monetary gain realized by performing a project versus the amount it costs to execute the project. The higher the BCR, the better the investment. General rule of thumb is that if the benefit is higher than the cost, the project is a good investment.

Considering the application to this model to the public sector organization can be evidenced that payback and the accounting rate of return are considered too simplistic for allocating a public sector organizational resources.

## Capital Budgeting Processes

The capital budgeting process consists of five phases (Kee and Robbins 1991): *(1) planning*, *(2) evaluation*, *(3) project analysis and selection*, *(4) project implementation*, and *(5) control and project review.*

### Phase 1: Planning

The capital budgeting process begins with the identification of potential investment opportunities. The opportunity then enters the planning phase when the potential effect on the firm's fortunes is assessed and the ability of the management of the organization to exploit the opportunity is determined. Opportunities having little merit are rejected, and promising opportunities are advanced in the form of a proposal to enter the evaluation phase.

Who is responsible for developing the capital budget and who is involved in the decision-making process should also be defined in this phase. In local municipalities, this usually falls on the city manager or the city treasurer.

### Phase 2: Evaluation

This step creates an initial wish list of projects. In this phase, project should be submitted using a formalized process and a summary page explaining the project, including illustrations and maps, outlined estimated costs, funding sources by year, how the funds would be used, and the maintenance costs associated with project.

Once you have identified the reasonable opportunities, you need to determine which ones are the best. Look at them in relation to your overall business strategy and mission. See which opportunities are actually realistic at the present time and which ones should be put off for later. Investment appraisal techniques, ranging from the simple payback method and accounting rate of return to the more sophisticated discounted cash flow techniques, are used to appraise the proposals.

### Phase 3: Project Analysis and Selection

After you look at all of the possible projects, it is time to choose the right project. Only the projects that mesh with the goals of the organization should be chosen. Considering the returns and risk associated with the individual project as well as the cost of capital to the organization, the organization will choose among projects so as to maximize stakeholders' wealth.

Assessing project risk allows to identify the pros and cons of a particular project. Such determining factors should include:

- The state of the economy, both local and national, and also changes in interest and exchange rates, which can have serious implications for the financing of such projects
- Sufficiency of project staffing which may impede the delivery of projects on time and within budget

- Effectiveness of project management systems, including channels of management authority, which can hamper project monitoring and construction oversight. Accuracy of financial records and reports, as well as loose monitoring of contractor financial controls
- Sufficiency of insurance which may lead to gaps in property and casualty loss coverage, while insurance premiums may be excessive given the actual project risk

Financial theory suggests that the analysis of an investment risk is necessary to evaluate the likelihood that an asset will yield a less than satisfactory return. The evaluation of the risks is important and organizations should attempt to incorporate it into their investment decisions. Like the application of capital budgeting models, the use of risk adjustment techniques varied substantially in the private and public sectors (Froot and Stein 1998).

In the private sector, the risk-adjusted discount factor, which changes an investment's required rate of return to reflect the uncertainty of its cash flows, is the technique employed most frequently to adjust for risk. In contrast, public administrators tend to select risk adjustment techniques that supplement more qualitatively oriented models.

**Phase 4: Implementation**

Once the decisions have been made, it is time to implement the projects. Implementation is not really a budgeting issue, but you will have to oversee everything to be sure it is done correctly. After the project gets started, you will need to review everything to make sure the finances still make sense.

**Phase 5: Control and Project Review**

The progress of the project is monitored with the aid of feedback reports.

Project controls are necessary to ensure that the underlying cost and schedule data are sufficient and reliable, that on-site construction status is observed and documented, and that the architects, engineers, and the contractors are addressing technical issues.

The control may improve future procedures and decisions concerning capital investments as well as their implementation. The control also allows the organization to review continuing investments, such as multiyear projects, so information about its success or failure can be learned before the end of the long-term project, which may lead to terminating the capital investment.

There are many items that can be included in a project control checklist for the purpose of project monitoring, such as:

- Assessment of project design and related costs
- Master project schedule with milestones and completion dates
- Project work-breakdown structure as developed, assigned budgetary
- Schedule authority guidelines
- Project budgeting process implementation
- Documented control processes

Finally, when a project terminates, or even before, the organization should review the entire project to explain its success or failure. This phase may have implication for forms of planning and evaluation procedures. Further, the review may produce ideas for new proposal to be undertaken in the future.

Within the five phase evidenced, in the corporate sector, project definition and cash flow estimation are the most important and also the most difficult phase of capital budgeting. The last steps (project implementation and project review) have a minor relevance in the capital budgeting process, as either they represent the most crucial or most difficult aspect of investment management.

In the public sector, the order of phases 1 and 3 is reversed. Public sector organization ranked financial analysis and project selection as their most critical and most difficult phase of capital budgeting. This was followed by project definition and cash flow estimation, project implementation, and project review, respectively.

The reversal of phases 1 and 3 in the public is explained by the fact that capital investment models have been developed for use in a profit-maximizing context, while in the public sector, the profit is not a significant investment consideration.

Consequently, it is evidence that in most instances the corporate sector models are not

meeting the needs of public administrators for analyzing and selecting capital investment alternatives.

Therefore, despite certain similarities, the differences between the way capital budgeting is done in the private sector and public sector are often great and in several respects decisive.

Firstly, in the private sector, the company uses multiple budgets, i.e., capital budgets, operating budgets, and cash budgets. Operating budgets focus on the performance of the administrative unit, outputs produced, and resources consumed. Cash budgeting is an estimation of the cash inflows and outflows for a business for a specific period of time. In the public sector, there are no multiple budgets; public sector organizations try to make one process do the work of three. In particular, paradoxically, liquidity is rarely a serious concern to most national governments.

Secondly, private sector capital budgeting is selective; in contrast, public sector capital budgeting tries to be comprehensive. All planned asset acquisitions, including current assets as well as long-term assets, are typically included under the authorization process.

Thirdly, private sector capital budgeting tends to be a continuous process. Instead, capital budgeting in the public sector tends to be repetitive; most appropriations are reconsidered annually on the basis of a rigid schedule.

The biggest difference, however, between budget authority in most public sector organization and the capital budgets approved by top management of the private company is the objective. The objective of capital budgeting in the private sector is the identification of options with positive net present values, in order to maximize the welfare of the company's shareholders, while in the public sector, many government decisions aim to maintain an effective management. Moreover, the reduction of the costs and increasing efficiency of the public sector entities have made the satisfaction of budget constraints a goal.

## Conclusion

Capital budgets in public sector entity have multiple roles, as instruments of fiscal policy and to improve the net worth of governments and as vehicles for economic development, particularly in the area of economic infrastructure.

A key challenge in government capital budgeting is to define an appropriate balance between current and capital expenditure. The capital budgeting practices differ substantially between private and public sector. While the sophisticated capital budgeting and risk adjustment techniques are the dominant models employed by the management of public sector entities, public sector administrators seldom use such budgeting techniques. Administrators of the public sector organization rely heavily on qualitative factors that are integrated into a more "intuitive" capital budgeting decision process. Due to the limited use of sophisticated capital budgeting techniques in the public sector, administrators are not realizing the full potential of the models. When sophisticated capital budgeting techniques are applied, activities such as project definition, cash flow estimating, risk assessment, implementation, and project review can be greatly enhanced. Therefore, they allow to choose investments or programs that not only accomplish a social "good" but also contribute to the long-run financial viability of the public sector entity (Poterba 1995).

### Synonyms

Caregiving; Informal care service; Somalia; Women caregivers

### Definition

Caregiving is conceptualized as the various forms of social, economic, emotional, physiological, and psychological services administered to vulnerable groups including the aged.

### Introduction

The last couple of decades have seen an upsurge in the activities of caregivers. In view of the central role that caregivers play in healthcare, caregiving has ensuingly become an inextricable component of the healthcare delivery systems in both developed and developing countries around the world. In essence, caregiving is steadily, albeit, gradually gaining a central position in so far as international discourses on global wellbeing are concerned. This development could partly be attributed to the growing sense of urgency brought about by and associated with challenges and opportunities posed by aging – at least as evidenced in the recent increase in aging policy initiatives across a wide range of social structures (United Nations 2017). Against the backdrop of an increasing global population comes an attendant increase in a growing share of older people whose upkeep responsibilities are dependent on social caregivers.

All over the world, family caregivers play significant roles in the global population development and transition process. The roles of caregivers become more sharply significant more particularly at a time that global health systems remain challenged regardless of the groundbreaking technological inroads chalked in global healthcare. The deficit in healthcare engendered by population increase has partly been offset by caregivers whose indispensable services have significantly contributed to mitigating the debilitating impacts of ill health on individuals and households alike. Evidence of the pertinent roles of caregivers abounds around the world. In the views of Sudhinaraset et al. (2013), about three-fifth of care services are mainly and largely dispensed by caregivers. In this same regard, the National Alliance on Mental Illness (2008), as cited by Arkorful et al. (2020), posits that approximately 69% of family caregivers have cared for ill relatives. Furthermore, the National Alliance for Caregiving (2009) also avers that a population of 16 million people have freely and voluntarily dispensed caregiving services.

Precisely in the United states (where policy deinstitutionalization in the early 1960s moved patients out of the institutions into the community, resulting in families becoming caregivers), the National Alliance for Caregiving and the American Association of Retired Persons (2009) provides evidence of about 30% of the US population

providing caregiving to ill people. The General Social Survey (2019) reports of people aged fifteen and above to have administered caregiving services at one point in life in Europe. In North America, Steiner (2015) reveals that four million Canadians have provided caregiving to a family member. In addition, in Asia, precisely India, about two-thirds, representing 69% of family caregivers, are reported to have provided essential caregiving services (National Alliance on Mental Illness 2008). Overall, caregivers constitute approximately 48% of the entire population of healthcare service providers (Sudhinaraset et al. 2013). This underscores the fact that the wide range of services provided by caregivers are as essential as those provided by healthcare professionals (Sudhinaraset et al. 2013).

Against the backdrop of the pertinent services that caregivers provide in other jurisdictions, it is instructive to state that caregiving has been an enviable facet of the African social, as well as the healthcare service delivery structure. To this end, the overly communal nature of the African society where families and friends care for each other has made caregiving an integral part of its social structure. This situation is not different from what pertains to Somali where years of protracted civil unrest have dealt enormous impacts on not only social, political, economic activities, but also the general healthcare systems, including the health of individuals and households. Given this situation, caregivers have steeped in to provide shock absorber services – principally meant to assuage the consequences of ill health. Moreover, much as these caregiving engagements remain daunting, family and friend relations render them wholeheartedly and with pride. This situation could be ascribed to the sense of social belongingness embedded in the Somali society.

An appreciation of the roles of caregivers could perhaps be better appreciated when situated within global population growth dynamics. Studies have projected population growth and possible consequences, especially for policy. Kowal and Byles (2015), for instance, project a population increase in people aged sixty and above from 900 million to 2 billion by 2050. The United Nations also project older persons population to reach 2.1 billion by 2050 (United Nations 2017), with a resultant population increase in developing countries projected to be home to a growing share of the world's older population (UN 2017). The developing regions were home to approximately 56% of persons aged 60 years and above in the 1980s. In 2017, an estimated over two thirds of the world's older population reportedly lived in the developing regions.

This population is expected to increase by more than two folds (from 652 million to 1.7 billion) by 2050 in the developing world. Meanwhile, the developed regions are expected to experience a 38% increase (from 310 to 427 million) of persons people aged 60 and above by 2050. Juxtaposing these population projections demonstrates the enormity of the consequences ahead of developing regions, particularly in Africa where the population of older people aged 60 and above is anticipated to increase by threefold from 69 to 226 million. Specifically, in sub-Saharan Africa, He and Kowal (2016) project a rise in population of people older than 60 years from 46 million in 2015 to 161 million by 2050. Taken together, these situations portend quite a challenging situation with diverse implications for sectors including but not limited to labor and financial markets, demand for goods and services such as housing, transportation, and social protection, as well as family.

At this point, it is important for state and non-state actors to design innovative policies and services targeted at addressing care needs of older persons, which is very important especially when evaluated through the lens of the sustainable development goals (SDGs) – precisely goal 3 – "Good health and well-being." The population structure of Somalia is a youthful one growing at 2.8%, with about 45.6% below 15 years. Populations between 15 and 64 comprise 52.3%, while population aged 65 and above are made up of 2% (UNFPA 2014). The relatively smaller population of the aged notwithstanding, social media discourses have recently been dominated by discourses underscoring challenges saddling the aged and caregivers as well. Significant anecdotal evidence highlights widespread hardship, owing to the nonexistent social policy intervention programs and policies.

As a basis to gather empirical evidence, employing a qualitative approach, the study sets out to investigate caregivers' roles and challenges in Somalia. This study will contribute to policy by drawing state and nonstate actors' attention to the phenomenon under investigations, while providing necessary pointers for policy. As a seminal study, the study will set the framework for social work and caregiving studies, which remains an unexplored area in Somalia. The remaining segment of the entry is arranged as follows: "Methods" section discourses on the approaches employed for the study; "Data Analysis" section captures approaches in analysis data; study outcome is presented in the "Results and Findings" section; extensive study discourse is highlighted in the "Discussion" section; and the final part covers study implications, further research opportunities, and conclusion.

## Methods

### Study Design and Context

To enhance data gathering to investigate roles and challenges confronting caregivers in Somalia, the study undertook a qualitative exploratory study from 22nd May to 30th July 2019 in some selected rural (Bacaadweyn and Daarsalaam) and urban areas (Garoowe and Baladweyne). Going by the recommendations of Patton (2014), the intricacies of underlying caregiving were investigated to find out from a first source perspective, the real and actual experiences caregivers go through on daily basis in discharging their voluntary informal duties. And to tap deep into the feelings of participants, the study also referred to Angen (2000). These dual approaches enhanced mutual interaction between the research team and the study participants. In this situation, while participants have an advantage to air their views, the researcher on the other hand is also offered an advantage to delve deep into the emotions of participants to gather rich information for the study under investigation.

### Study Participants and Sample Procedure

Using a combination of purposive and snowball sampling technique, data for the study was elicited from a sample of Forty (40) women. Purposive sampling was employed to identify a caregiver who was later entreated to help in identifying other caregivers in the study area as recommended by Babbie (2020). Following these recommendations made it easy to identify other caregivers in other areas. The recommendation of participants by another participant facilitated in building trust between the researchers and study participants. This helped in gathering relevant, quality and in-depth data for the study.

### Eligibility Criteria

In drawing data, a set of inclusion and exclusion criteria were set and strictly followed. The following inclusion criteria were used to select study participants.

(a) Caregivers providing care service to persons above sixty (60) years
(b) Caregivers who have provided care giving services for more than five (5) years
(c) Caregivers within the selected rural and urban areas

On the other hand, participants were exempted based on the following exclusion criteria.

(a) Caregivers providing caregiving services to people below sixty (60) years
(b) Caregivers who have provided services to for less than five (5) years
(c) Caregivers outside the selected rural and urban areas

### Data Generation Tools and Procedure

In drawing data, an in-depth, face-to-face interview guide structured into three (3) sections in line with the study objectives was designed and used. The first section of the questionnaire gathered data about the sociodemographic characteristics of participants including age, sex, marital status, religion, ethnicity, occupation, and level of education. The second segment concentrated on

the roles of caregivers. The final section gathered data on the challenges of caregivers. The face-to-face approach was used to gather detailed information from the perspective of participants. And more so, the study design enhanced the gathering of rich data. Collection of data prioritized the convenience of participants. This is because the study assumed that the convenience and physiological soundness of participants constitute a bedrock to enhance information sharing by participants. In our interactions, participants freely spoke on the subject matter under investigation. Instruments used included a tape recorder, a note book for keeping records and pen for writing. Interviews were conducted in Somali. Interviews lasted for about 30–60 min. Before the commencement of data collection, questionnaires were pretested among a sizeable sample of ten (10) participants in the selected study areas. The questionnaires were subsequently restructured based on identified lapses and recommendations gathered. This informed the design of a final questionnaire which was sent to four academic experts for peer review and approval. The results of the piloted questionnaires were however not included in the final data used for the analysis. Participation was strictly voluntary and participants were told of their liberty to opt out at any time. Besides, participants were assured of the anonymity and confidentiality of information provided. To ensure the protection of data elicited, audio recordings were kept safe in a password protected folder on a computer in the researchers' laboratory.

## Data Analysis

In placing study findings into context and perspective, the study made use of the inductive process of data analysis to establish research themes and situate discourses within the appropriate context.

This helps researchers to capture hidden, salient, and varying issues (Dimitroff et al. 2005) while drawing original and reliable information from participants (Patton 2014). Following the recommendations of Richards and Morse (2012), data analysis steps involved interview transcription, listening to audio recordings gathering detailed insights of the subject matter under investigation, and developing and establishing data codes to generated themes. Interview transcriptions alongside field interview notes were analyzed with the help of a coding system developed by the research team. To undertake a step-by-step data codding, memos were developed to facilitate tracking the process of data collection and analysis. This enhanced the development of labels and naming of research concepts which further facilitated the construction of research themes in consonance with the overall research objectives. Initial codes developed revolved around caregivers' roles and challenges. Our interaction provided sufficient evidence that informal caregivers were enormously challenged. The major themes developed had subthemes presented in Table 2. The views shared by participants were compared and contrasted with other perspectives with relevance to the issue under investigation. In presenting results from analyzed data, feedbacks of participants were presented as quotations to buttress expressed opinions.

## Results and Findings

The study sampled forty (40) participants providing caregiving services and assistance to older people. As presented in Table 1, it could be deduced that majority of the study participants were above 50 years. Married people were 27. The study also revealed that most caregivers had provided assistance from 5 to 7 years. All study participants were Muslims and with regards to clan affiliation, majority of study participants belonged to the Darod Clan. With 5 participants revealed to be employed, 25 were unemployed. 29 participants were also revealed to have had no education. Our interaction further revealed that caregivers were providing assistance to old people suffering from a wide range of ailments including, but not restricted to notables such as congenital anomalies, stroke, visual and hearing impairments, stroke, epilepsy, and paralysis.
